 Erides odoratum, 35
 Agaricus elvensis from Tonbridge, 208; in North Wales, 236
 Agave, a hardy, 349, 393; A. filifera var. filamentosa, 101; A. Romanii x, 325
 Agricultural returns, 389
 Aiton, Mr. Hugh, presentation to, 241
 Akebia lobata fruiting in Nottinghamshire, 376
 Allamanda violacea, 210
 Allium albo-pilosum, 34
 Aloes, South African, 99
 Alyssum pyrenaicum with Valeriana longiflora, 24; A. spinosum, 42, 62
 Amanita strobiliformis, 276
 Amaryllids, new hybrid, 345
 Amelanchier botryapium (canadensis) x and A. sanguinea, 82
 America, Carnation cultivation in, 51; irrigation in, 36; experiment station, 79
 Angraecum falcatum, 205; A. Rothschildianum, 131
 Anguloa uniflora var. eburnea, 170
 Annesley, Earl (*Beautiful and Rare Trees and Plants*), 389
 Anomatheca cruenta, 177, 210
 Anthogonium gracile, 252
 Anthurium Scherzerianum Wardi, 425
 Antirrhinum peloriate, 99
 Ant-poison case, the, 23
 Apiary, the, 26, 57, 117, 157, 191, 223, 271, 353
 Apospory, a case of, 32
 Apple crops and cider-making in Devonshire, 173
 Apple, James Grieve, 339
 Apples, from Canada, 159, 373; cider, in France, 159; late-blooming, 163; late-flowering, 179, 194, 228; second flowering of, 228
 Araucaria imbricata, coning of, 292
 Arbutus Unedo, 351
 Archontophoenix Cunninghami in Queensland scrub, 55
 Aristolochia siphon, 159
 Artichoke, a new long white Jerusalem, 250; Globe Perpetual, 258
 Arum, the white, and its cultivation in America, 284
 Ashstead Park, Epsom, Chrysanthemums at, 314
 Ashton, Mr. Ben. (Supplement, Vegetable Conference, Oct. 3)
 Asparagus, cultivation of, 194
 Asparagus drepanophyllus, 209
 Asplenium ebnoides, 6
 Aster Thomsoni, 275
 Azolla filiculoides in fruit, 211

B

BAMBOOS, best time to move, 48; flowering of, 96, 140, 162, 169, 228, 292
 Bananas, harvesting, 439
 Barr, V.M.H., Peter, 83

Bastin, Mr. W. L. (Supp. Vegetable Conference, Oct. 3)
 Beach's, Prof., proposals for a scientific horticultural society in America, 58
 Bean, dwarf, Favourite, 250; Progress, 250
 Beans, Improved Windsor, 400
 Begonia corallina, 62; B. Gloire de Lorraine, 339; on balloon trellises, 376; B. (foliage) "His Majesty," 372; B. Marie Bouchett, 71; B. (foliage) Our Queen, 372; B. semperflorens "Golden King," 176
 Begonias, the development of, 372

Browne, Mr. W., presentation to, 30; presented with Imperial Service Order, 58

Bud variation in annuals, 82

Budding Roses, 14

Buddleia variabilis Veitchiana, 208

Burford Lodge, Dorking, 94

Bystock, the gardens at, 292

C

CABBAGE Early Gem, 250; C. St. Martin, 250

Cabbages and Celery, raising, 293; flowering of, 140

Cacao or Cocoa (*Theobroma cacao*), 115

Cacti, 98

Callicarpa purpurea, 402

Calochortus pulchellus, 133

Calodendron capense, 69

Camellia, the oldest, at Dresden, 159

Camoesia maxima, 316

Campanula calycanthea growing on a wall, 351; C. Medium, 267;

C. persicifolia, indigenous, 289; C. punctata, 392; C. Vidali, 394;

C. Vidali in the open, 161, 330;

C. Waldsteiniana, hybrid of, 82

Camptosema rubicunda, 178

Canada, progress in, 439

Cancer, and Fern development, 439

Candytufts, spring-flowering, 15

Canterbury Bell, the, 267

Carnation, bicolored, 161; C. Francis Samuelson, 56-60; C. Herbert J. Cutbush, 17; C. Madame Franco, and others, 332; C. Mrs. Lora Armstrong, 192; C. Souvenir de la Malmaison in the market, 52

Carnations, 326; and the Rust, 394, 407; at Leighton House, Westbury, 62; at Sandringham, 426; at Wretham Hall Gardens, 163; cultivation of, in the United States, 51; of two colours on one stem, 120; special culture of Tree, 357, 407, 441; sporting of, 140

Castlo Saunderson, bog or marsh garden at, 289

Catsetums from Moorteboeke, 252

Catleya amethystoglossa, 266; C.

- Duchesnei ×, 330; C. × Faerie Queene, 35; C. Gaskelliana, 188; C. × Iris, Tring Park var., 318; C. labiata, 382; C. l. autumnalis, 297, 325; C. l. Holford's variety, 420; C. Loddigesii, 382; C. × Mrs. J. W. Whiteley, 281; C. × Patrocini, Westfield var., 188; C. × Pittiana, J. Wilson Potter's variety, 189; C. Trianae varieties, 266
- Cattleyas at Somerghem, 283
- Cauliflower Incomparable, 258
- Ceanothus, the varieties of, 100
- Cedars, historic, 265
- Celery, slugs on, 392
- Cereus candicans, and C. c. Dumesnilianus, 162; C. grandiflorus, 121
- CERTIFICATED FRUITS AND VEGETABLES:**—Apple Middle Green, 579; Carrot, Veitch's Intermediate, 279; Cauliflower, Damman's Eclipse, 211; Celery, Pink Plume, 279; Lettuce, Lord Kitchener, 279; L. Staghorn, 279; Melon, Barnes' Fiscal Problem, 279; M. Marquis' Favourite, 279; M. President Loubet, 78; M. Westonbirt Seedling, 340; Peach Peregrine, 143; Potato, Dalmeny Beauty, 211; P., H. Fincham, 211; P., Maid of Coil, 211; P., Tim Gray, 211; Runner Bean, Hackwood Success, 143; Strawberry, The Roydon, 279
- CERTIFICATED PLANTS:**—Angræcum Rothschildianum, 104; Asparagus plumosus cristatus, 64; Begonia × His Majesty, 309; B. Marie Bouchett, 64; B. × Our Queen, 309; Campanula peregrina, 27; Carnation Diadem, 27; C. Merlin, 27; Carnations, F. A. Wellesley, Ivo Sebright, Speranza, and Richness, 66; Cattleya × Atalanta superba, 104; C. × Exquisite, 181; C. × Fabia Mary de Warrin, 310; C. × F. W. Wigan, Peeters' var., 310; C. × Gautieriana, 310; C. × Hardyana albens, Peeters' var., 340; C. Pittiana, 181; C. × St. Gilles, 340; C. × Tankerville, 181; C. Warszewiczii White Queen, 104; Chrysanthemum Allman's Yellow, 410, 428; Dorothy Pywell, 377, 379; C. F. S. Vallis, 309; C. J. H. Silsbury, 341; C. Lady Cranston, 377, 379; C. Maude du Cros, 309, 310; C. maximum var. King Edward, 181; C. Kitty Bourne, 340; C. Miss A. Dighton, 341; C. Miss Jessie Dean, 341; C. Mrs. Barnard Hankey, 341; C. Miss E. Holding, 309, 310; C. Mrs. J. Dunn, 341, 377; C. Mrs. J. P. Bryce, 310; C. Pink Beauty, 341; C. W. Pascoe, 341; C. Pink Pet, 379; C. Polly, 260; C. Souvenir de William Clibran, 410; C. The Champion, 180; C. W. A. Etherington, 340; C. Cirrhæa Warreana, 64; Codium turnfordiense, 428; Cymbidium × Wiganianum, 340; Cypripedium × Fulshawense, 340; C. insigne Sanderæ Oakwood Seedling, 429; C. Lawrenceanum Gratrixianum, 214; C. × Leeanum, C. Clinkaberryanum, 429; C. L. Staffordianum, 377; C. × nitens Wrigleyanum, 429; C. × Queen of Italy, 377; C. × Rappartianum, 214; C. × Ultor, 64; C. × Ville de Paris, 340; Dahlia Mr. Amos Perry, 260; D. Spitfire, 260; D. Spotless Queen, 260; Dahlias, varieties of, 212; Erica gracilis nivalis, 309; Gladiolus Ellington Belle, 104; G. gandavensis Van Dael, 180; G. Lady Muriel Digby, 142; G. Nymph, 142; Hidalgua Wercklei, 180; Lælia × Iona, Southgate variety, 142; Lælio-Cattleya × Bletchleyensis, 64; L.-C. × Bletchleyensis Ruby King, 340; L.-C. × Cassiope, Westonbirt var., 377; L.-C. × Gottoiana regalis, 310; L.-C. × Haroldiana, John Bradshaw, 310; L.-C. × Norba superba, 279; L.-C. × Wrigleyi, 310; Lathyrus latifolius albus grandiflorus, 45; Liliium elegans, Peter Barr, 64; L. speciosum magnificum, 260; Nephrolepis, Fosteri, 64; N. Mayii, 278; N. Piersoni, 104; N. Westoni, 309; Nerine, Miss Moore, 340; N., Miss Woolward, 340; Nymphæa gigantea, var. Hudsoni, 64; Odontoglossum crispum Mariae, 429; O. × Harryanocrispum virens, 429; O. × Vuylstekei vvicans, 429; Phaios-Cymbidium × chardwarensis, 310; Polystachya Buchananii, var. viridis, 214; Papaver (Poppy) Cardinal, 45; P. glaucum, 45; P. Mephisto, 45; Poppies, White Colossal, Murselli fl. pl., American Flag, Blush Cardinal Victoria, and arenarium, 45; Pteris metallica, 64; Senecio tanguticus, 213; Sidalcea candida, Rosy Gem, 213; Smilax aspera (sagittifolia), 213; Sweet Peas, Scarlet Gem, King Edward VII., Bolton's Pink, and Florence Molyneux, 45; (Cupids) Royalty, Her Majesty, Lottie Eckford, Mrs. J. Chamberlain, and Captain of the Blues, 45; Tamarix hispida æstivalis, 180; T. odessana, 142; Vitis armata, 180; V. flexuosa Wilsoni, 180; V. megaphylla, 180; V. sinensis, 180; V. Thomsoni, 180; Zygopetalum × Roeblingianum, 214
- Chamærops humilis, an aged, in Berlin, 423
- Cheal, Mr. Ernest, 274
- Chelsea Physic Garden, lectures at, 274, 285; see also Hall, A. D.
- Cherries, sweet, 325

MISNAMED ROSES.

I WAS somewhat astonished, when looking over some manuscript notes on Roses, to discover the exceeding number of plants having not the slightest relationship to the true Rose that are or have been called by that name. A too cursory examination might lead to the supposition that these names had been bestowed without consideration, so great is the discrepancy existing between such plants as the Pea, the Hollyhock, the Cherry, the Willow, and many others, as well as the Rose itself. As a fact, however, in very few instances is there any difficulty in tracing the connection. The great majority have flowers like single Roses; and indubitably that is the reason why they have been called Roses. Others are like double Roses, while in the case of a very few leguminous plants, it is not easy to trace the connection. For the sake of distinction these "Rose" plants may be divided into sections—those named after other plants; those having some distinctive appellation, such as water, sun, or wind; others named from a season of the year, or after a country, or, in the case of the smallest number, after a person. Of the latter, the Mary Rose is *Ledum palustre*, St. Mary's and Juno's Rose, *Lilium candidum*; the Gipsy Rose, from its dark colour, *Scabiosa atro-purpurea*; the Woodman's Rose, *Rubus spectabilis*; and Christ's Rose, the same as Christmas, New Year's, and Winter, which is rightly *Helleborus niger*. The oriental species of *Helleborus* are well known as Lenten Roses; and the double Daffodil, not the single, sometimes has the same designation. *Cistus annuus* is the Rose of a Year, *Kerria japonica* the Summer, and *Viburnum Opulus plenus* the May

Rose, though *Rosa cinnamomea* is more correctly so called, as in Moore—

"Sooner shall the Rose of May
Mistake her own sweet Nightingale."

The *Viburnum* is noteworthy as still bearing an old, but erroneous name, Guelders Rose, an eighteenth-century improvement on which is Guelderland Rose; but if we are to credit Parkinson, the correct form is Elder-Rose, or rather Rose-Elder, the equivalent of *Sambucus rosea*, its Latin name in bygone days. *Spiræa opulifolia*, it may be noted in this connection, was the Virginian Elder-Rose. Most persons would, without hesitation, declare for a species of the true Rose as being the China, but *Hibiscus syriacus* and *Astragalus sinensis*, both have a prior claim. Then someone has tried to improve on Gipsy for the Sweet Scabious, and denominated it Egyptian! One of the oldest designations belonging to the French Marigold is Indian Rose; while the *Camellia* at one time in current speech was the Rose of Japan. *Lupinus luteus* flourished under a variety of names, bestowed upon it, according to Parkinson and Coles, in order to cheat the buying public, one such being the apparently meaningless Virginian Rose. It has an interest of a kind, as indicating a custom long established among nurserymen to offer the horticultural world wares from a new country under taking names. Turner described the curious *Anastatica hierochuntica* as the Rose of Jericho, which on the Continent is commonly associated with the Virgin Mary, and described as her Rose; while Rose of Sharon, which has been a stumbling-block irremovable by any commentator, is the popular name among gardeners of *Hypericum calycinum*, *Rosin* Rose being less commonly in use. The South Sea Rose, *Nerium odorum plenum*, was at one time well known; and about 200 years ago, in that age of artificialities, Rose Tremier did duty for Hollyhock, which has also been called Beyond-the-Sea Rose, Holly Rose, and Rose Mallow. Rose of Heaven I have found nowhere save in Mrs. Loudon's book on *Annals*, and that is perhaps her own rendering for *Agrostemma Cœli-rosa*. Then for the Buttercup, a not common equivalent is Butter-Rose, which I note also as being applied to the Primrose. Marsh Rose is also uncommon, while Water Lilies, it may not be generally known, had a narrow escape from being Water Roses—a designation pretty and appropriate, and having, moreover, first claim. The Wind Rose is naturally the Anemone; while the Sun Rose is *Helianthemum vulgare*, sometimes called the Holly Rose, but more commonly the Rock Rose, from its delighting in a sunny position on rocky banks. *Convolvulus Cneorum*, *C. Dorycnium*, and *Daphne Cneorum* are also Rock Roses, as well as a number of species of *Cistus* and *Helianthemum*. The common Sea Pink is appropriately known also as the Cliff Rose, because it avails itself of the most unexpected positions on the faces of sea cliffs, existing, to all appearance, without any soil to support it. In forgotten books, Rose Pomey, an Eugenia, and Rose Martinico, a *Hibiscus*, occur. Then there is the peculiar Rose Noble, for Wild Comfrey; the Elizabethan name Rose-a-Rubie for *Adonis autumnalis*, and Rose-root or wort for the Rose-scented *Sedum rhodiola*, by Lyte named Rose-water.

It remains now to pass in rapid review the many plants possessing Rose as a distinguishing name, and of which it must be said nearly all have dropped out of current use. Among these are some we could ill afford to lose, as, for instance, Rose Jessamy, which the notorious Dr. Hill has rescued from oblivion. The plant is still cultivated as *Jasminum Sambac* fl.-pl., and though smelling as sweetly as it did in the days of powdered wigs and monstrous head-dresses, no one would imagine so from its present name. Pæonies are hereabouts called "Peeny-Roses,"

an interesting modern use of an ancient name, for Gawain Douglas relates how a—

"Cure was done by Esculapius sle
Throw the mycht of the rois Pione."

In some pastoral districts it was known as Sheep-shearing Rose, because the flowers were available at the season sheep yielded their fleeces to the shepherd's shears. The Poppy very naturally was called Corn-Cup, and Copper Rose; and it was the unlucky means of causing poor Gerard to perpetrate one of the most ridiculous of his blunders—that where he testifies to red Roses growing among corn in Cheshire! *Agrostemma Githago* has also been noted as a corn Rose, but possibly by mistake; but there is none in the case of *A. coronaria* being the Rose Champion. In "Master Tuggie's Rose Gilliflower" we have the earliest use of the word to indicate the form of a petal, the so-called Rose-leaf. Parkinson, it may be said, was fond of the name. With others already mentioned, he is responsible for the Rose Cowslip, a double green variety; green Cowslips and Primroses, being rather popular, and so common that Spenser refers to them in the *Shepherd's Calendar*. The double form of *Prunus avium* is described as the Cherry Rose; his Rose Cranesbill is decidedly prettier than our Bloody Geranium; and for Tradescant's Rose Daffodil he could discover no fitter name. Some are, however, much older than John's day; Rose Persely, for instance, dating back to Turner, who apparently means *Anemone hortensis*, but later writers mean undoubtedly *Anemone coronaria*. Rose Pea too is of great age, and indicates a variety that produced its flowers in terminal clusters. Miller calls it Rose of Crown; and as the Crown, Scotch, or Mummy Pea, it would appear to have held its position as a highly esteemed variety during a very lengthened period. Other Legumes comprise *Lupinus pilosus*, the Rose Lupine; *Melilotus officinalis*, the Rose Lotus; *Robinia hispida*, the Rose Acacia. Rose Columbine and Rose Jonquils are old names of double forms of these flowers; Rose Mallow, a modern equivalent of *Malva rosea*; while Rose Laurel carries us backwards again many centuries, this and Rose Bay being applied, to the Oleander, in each instance the one name being descriptive of the foliage, the other of the flower. Rose Bay applies also to *Epilobium hirsutum*; while *E. angustifolium*, one or two species of *Rhododendron*, and *Kalmia latifolia* also have an interest in it. *Cistus salvifolius* has been called the Sage Rose, *Verbena Aubletia*, Rose Vervain; and in the south of Scotland, *Juncus squarrosus* is a Rose Bent. In addition to these there are a few abnormal forms of vegetable growth that could only be described by old writers by the word "Rose." Such are the curious forms of *Plantago lanceolata*, Rose Ribwort; *P. major* and *P. media*, both of which Gerard called Rose Plantain; and to conclude the series mention must be made of *Salix Helix*, L., the young growths of which being malformed by a *Cynips* intent on the duties of maternity, retain the appearance of rosettes after the fall of the leaf, and on that account we find such names as Rose Willow and Rose of Cambridge applied to it. *R. P. Brotherston*.

NEW OR NOTEWORTHY PLANTS.

EUCOMIS JACQUINII, C. H. Wright.

Two plants have been confused under the name of *Eucomis nana*. The original, described by L'Héritier, in his *Sertum Anglicum*, p. 17, has obovate leaves, long, and tapering to the base; its peduncle is spotted with purple, and the comal bracts have a distinct purple border. This is the plant figured in the *Botanical Magazine*, t. 1495, and for which the name *E. nana* should be retained. The other plant, figured under the same name in Jacquin's *Hort. Schanbrunn*, i., t. 92,

also has obovate leaves, but they taper less to the base, and are comparatively broad; the inflorescence is destitute of purple. For this latter plant, which has recently flowered at Kew, I propose the name *E. Jacquini*. *C. H. Wright.*

POA ANNUA A SELF-FERTILISER.

In his interesting observation on this grass, Mr. Lynch does not allude to the most important

within the anther-cells. Nearly the whole of a panicle may be still compacted and half hidden within the leaf-sheath, while the anthers of the uppermost spikelets have shed their pollen. The topmost spikelet is often female, and, of course, must receive a grain from some other floret.

The entire spikelet does not stand more than from a $\frac{1}{2}$ in. to at most $1\frac{1}{2}$ in. above the soil among the blades cut short by the mowing machine. Every grain is set when there is no wind at all.

Mr. Lynch touches upon the wider question of the supposed superior advantages of intercrossing. From a florist's point of view, this is undoubted; but the "stimulus" is not permanent. This question was settled a quarter of a century ago. I would refer Mr. Lynch to my paper on "Self-Fertilisation" (*Trans. Linn. Soc.*, 1877), to Müller's "Fertilisation of Plants" (1883), to my "Origin of Floral Structures" (1888), and to Kerner and Oliver's "Natural History of Plants," s. "Autogamy."

With regard to "Essex's" enquiry, I can only speak from my own experience, as given. Let "Essex" try it at once, in a small portion, and let it seed freely. If he finds that it begins to oust the others, let it seed itself freely, and perhaps next year it may be mown, as it will die its usual annual death. It has practically filled my lawn in five years, and makes an excellent and soft "pile." *George Henslow.*

HOME CORRESPONDENCE.

SAXIFRAGA GUILDFORD SEEDLING.—In writing of the coloured forms of the mossy *Saxifraga* in the *Gardeners' Chronicle* recently, Mr. S. Arnott mentions the above. As there appears some doubt as to its origin, and as the gentleman in whose garden and collection it first appeared is no longer with us to speak for the plant he so much cherished, I will place on record that which I know concerning it. I was spending the day with the late Mr. Selve Leonard at Guildford some three or more years ago, when in going into the garden almost his first words were—"I have got something I think you will like;" and he straightway took me to the plant now known as *Saxifraga* "Guildford Seedling." After a good deal of admiration, and asking many questions, Mr. Leonard distinctly told me that "we know nothing about it, mere than the fact that it occurred here as a spontaneous seedling; in fact, we have nothing like it." Then it was that I pointed out the resemblance in growth and other particulars, as, e.g., time of flowering, height, &c., to *Saxifraga Rhei*, with the result that a plant of the latter was compared with the seedling, and upon closely examining each plant, Mr. Leonard agreed with me that it must be a chance seedling from *S. Rhei*, and so far as I know of he never wavered from that opinion. With his wonted kindness, Mr. Leonard very early sent me a plant of the new kind. This then is, I believe, all the history attaching to this fine plant. I regret, however, to find that there is a spurious form in circulation, not nearly so good or rich in colour, and without one of the most distinct characteristics of the true plant, viz., its richly-coloured stems. Grown fully exposed, that is without frame protection and the like, the Guildford plant is of interest from the very advent of the flower-stems, and their rich colouring is maintained till the greater beauty of the intense-coloured blossoms is revealed. I know of no other species that so strongly embodies this fine feature. It is, however, sufficient to give a clue to the true plant at a glance, even before the flowers expand. *S. Fergusoni* I have not grown, unless I have it under another name, for I have an inferior plant to the above, which is distinct also from *S. Rhei*. I agree with Mr. Arnott's remarks as to the distinctions between *S. muscoides* and *S. Rhei*. In its profuse flowering, its greater freedom also, and in the conical character of the growth, i.e., rosette, *S. muscoides atro-purpurea* differs widely from the greener, mere hairy, sparse-flowering, and flat, table-shaped rosette of *S. Rhei*, for example. By the way, there is yet a large flowering kind of *S. Rhei* known as *S. R. superba*. It differs simply in being of larger growth, greater stature, and in having decidedly larger flowers. It is, in truth, an enlarged *S. Rhei*. *E. Jenkins, Hampton Hill.*

EUPATORIUM ODORATUM.—It is pleasing to notice that reference has been made to this odd and somewhat neglected plant. When well grown, few decorative subjects give such good returns for the time and labour spent on them. For some years I have grown a good batch for

FIG. 1.—A SEAT IN A ROSE-COVERED ARBOUR.

(From a photograph by F. Mason Good.)

point, viz., the exact period when the anthers first burst and shed their pollen. My own observations lead me to conclude that this takes place as soon as the florets open, when the stigmas protrude and the anthers are just above them, i.e., before the filaments are elongated to their full extent. Indeed, sometimes the pollen has escaped before the florets open. So rapid is the process, that the anthers of any floret may have lost all their pollen before the one next below is open at all. As far as I have observed, in no case were the elongated filaments, when hanging out to their fullest extent, with any pollen still

I still, therefore, adhere to my view of self-fertilisation. If any pistil of one floret happen to receive the grain of pollen required to fertilise it from another on the same plant, this is practically equivalent to self-fertilisation; but the latter is far the more probable. The well-exposed stigmas and the anthers hanging out of the floret are no proofs of intercrossing. It depends upon the time which elapses between the maturation of stigmas and anthers. If this be zero, and the two are made together, and that before the filaments have elongated, then self-fertilisation is the result.

FIG. 2.—NOISETTE ROSE LAMARCK: FLOWER WHITE, WITH CENTRE OF DEEP STRAW COLOUR.

(From a photograph by F. Mason Good.)

conservatory decoration during the autumn and winter months, and when the plant is placed among zonal Pelargoniums, Chinese Primulas, &c., the light fluffy flowers give lightness and finish to the arrangement, and they last for a considerable time in good condition. Another small-growing Eupatorium, and equally useful as the foregoing, is *E. riparium*. The habit of the plant may be faulty, but this can be overcome by timely staking and disbudding. Cuttings rooted early form plants that will commence to flower in January, and continue to produce flowers for eight or nine weeks. Eupatoriums may appear rather commonplace subjects, but where a large number of decorative plants are required, and the means of production limited, easily grown and useful plants have to be considered. H. S.

FORTUNE'S YELLOW ROSE.—Having a plant of this favourite Rose under my charge, I have closely followed the recent interesting correspondence, hoping that information would be forthcoming as to the cause of and a suggestion of a remedy for the shedding of the foliage. Judging from the remarks of the several correspondents, it would appear rather singular that the dropping of the leaves, should generally take place at the same stage of growth, viz., just before the buds open. The plant in my charge is growing in an inside border, and is trained on the east side of a span-roofed house, and as a rule we get a good quantity of blooms; but the leaves are more or less liable to shed just as the flowers are about to expand. As Mr. Fyfe points out, any Rose devoid of foliage has lost half its charms; which is especially true of Fortune's Yellow, the elegant foliage forming a perfect setting for the flowers. My impression is, that if the supply of moisture in the atmosphere and at the roots is carefully regulated, the evil may be greatly reduced. H. Stark.

SWEET PEAS.—The discoveries of Mendel opened a wide field for experimental work. For some years I have been specially interested in the subject of seed sports and reversion amongst florists' flowers. Everyone must have noticed that the Sweet Pea seems to become more and more inclined to sport. From experiment and observation I have come to the conclusion that those who take the trouble to closely observe the sports, and compare them with sports occurring in other parts of the country, will find very

clear evidence of the working out of some fixed law. It is Mendel's. Last year there was a controversy over the new white Sweet Pea Dorothy Eckford. The decision of the National Sweet Pea Committee was, that it was the result of the accidental mixing of the seeds of a new white variety with that of Miss Willmott. Has anyone proved this decision to have been incorrect? I think I have! The fact of several growers sending up the same form as a sport from Miss Willmott proves that it occurred simultaneously in several parts of the country. If the seed had been mixed

by a wholesale house, this would be easily explained; but if the same sport occurs in Miss Willmott the next season and again in this, what are we to think? Again, if a number of Dorothy Eckford show a marked tendency to revert to Miss Willmott (which they do), why should they? Last season it was observed that some of the seeds of Dorothy Eckford were black, the majority being white. I have this season seen the result of keeping the black seeds separate. The white-seeded remain true, but the black-seeded seem very undecided, and in a row of 12 feet in length I have noted every transition from pure white back to Miss Willmott. I enclose blooms herewith, to show the intermediate states. Carefully saved seeds of Miss Willmott I have known sport to a pure white, identical with Dorothy Eckford. We will assume that a cross has been made, and the progeny is Miss Willmott; we will, as in Mendel's experiments, call it the dominant form. As all know, natural cross-fertilisation in Sweet Peas is practically impossible, and therefore for a certain number of seasons we have a true Willmott progeny. During these seasons the recessive form has been gaining power, and eventually shows itself—as a sport. Is it not possible and probable that Dorothy Eckford is the recessive form of a cross made some years ago? This season, I find Lady O. Gore, a cream, sporting freely to a form near to Othello; and Navy Blue is sporting in the same manner to a purple-maroon. Why should a large number of seeds sport to a definite colour? J. J. Cole, S. Arlington Terrace, Dereham. [The flowers described as the produce of black seeds of the variety Dorothy Eckford, are all more or less pink in colour, appearing like a badly selected strain of Miss Willmott, but they do not include such a white flower as Dorothy Eckford. If Dorothy Eckford is a sport from Miss Willmott, there is nothing unusual in the new variety reverting in instances to the type, particularly before it has been more or less fixed by selection. Ed.]

FRUIT PROSPECTS IN CORNWALL.—We have the worst fruit year we have ever had. The sharp frosts and cold winds in April were disastrous, and the only good crops we have are White Currants on a north wall; Strawberries, and three or four Apple-trees—Allen's Everlasting, a seedling, Luscombe, and Apple Blanche, a variety

FIG. 3.—AN ARCH OF ROSE FELICITÉ-PERPETUÉ AT MILTON COURT
(See *Gardeners' Chronicle*, June 20, 1903, p. 359.)

of which there are a few trees in the neighbourhood of Plymouth, said to have been grown from grafts brought from France after the occupation of Paris in 1815. It bears very well every other year, and is a fair Apple for dessert. Louise Bonne of Jersey, Clapp's Favourite, and Croft Castle, are the only Pears with any crop upon them. No Plums, but Figs abundant. *Henry Rogers, Hartley, Plymouth.*

THE JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY.—I quite agree with Dr. Bonavia, that this is attaining unwieldy dimensions, and that the expense of printing a large quantity of notes on subjects which interest only a very small portion of the Fellows, is partly wasted. It would be far better if the Proceedings were separated from the Transactions, and the latter were only sent to those Fellows who consider them worth paying for, as is done in the case of the Zoological Society. *H. J. Elwes, Colesborne.*

GRAPE LADY HASTINGS.—This variety came into commerce with strong encomiums from the Gardening press, as having all the good qualities that a good Grape should possess. I purchased a plant of it soon after its appearance, and planted it; but by the autumn it was almost dead, and in the following spring it failed to grow again. The vendors generously replaced it by another vine. I was therefore hoping that this would quickly exhibit the strong growth this variety was said to make, unless restricted at the roots. In two years this vine has made about 18 inches of growth, of about the thickness of an ordinary pipe-stem. That scarcely points to this vine requiring a restricted root run; or is this luxuriant growth the same as the other good points claimed for this variety? A Grape that will ripen with the earliest, and possesses a Muscat flavour, and a berry as large as that of Gros Colmar, which will hang well when ripe, ought to be worth growing. I have never seen fruits of the Lady Hastings Grape, and am giving the vendor's description as far as my memory serves me. Perhaps some reader of the *Gardeners' Chronicle* who has cultivated this variety successfully will favour readers with the particulars of his treatment of the plant. *Paul T. More.*

PARTIAL DEATH OF A VIBURNUM OPULUS.—A remarkable instance of this appears in a forecourt garden at Ealing. What was probably the sterile form (Gueldres Rose) was originally planted; in course of time, the stock triumphed over the scion, and formed a good head, which for a time bloomed freely and produced its bright red berries in the autumn. Then a few years ago, hypertrophy began to put in its appearance, so that gradually every twig on every branch showed excrescences. The result is, that all the branches springing from a main stem, 5 feet or so in height, and which formed a dense head, are dead. But from the main stem, just below the point where the branches radiated from the trunk, strong and vigorous growths are being put forth, as robust and healthy as one could well desire. Excess of moisture is said to be a cause of these excrescences, but as an asphalted path divides it by a few feet only from a deep drain which carries away the surface water, I can scarcely imagine this to be a cause, especially as on the other side, and not more than 8 feet or so away, there is a rather deep basement to the dwelling. If the death of the branches arose from some disturbance at the roots, one would scarcely imagine the young growths would be so vigorous. I should have thought the trunk would have decayed in the same manner as the branches. *R. Dean, Ealing.* [The cause of the production of these hard excrescences is unknown. We have known for many years a Thorn bush (*Cratægus*) covered with them. They are so hard, that an ordinary knife cannot cut them. ED.]

RUBUS REFLEXUS v. MOLUCCANUS.—At the Ghent Quinquennial Exhibition, held this year, plants of a distinct and attractive *Rubus* were shown by M. Duval and others, under the name of *R. reflexus*, said to have been of Yunnan origin. I saw and purchased some of these plants, and they now fill a bed on one of the lawns at Kew, where they promise to be a success, the growth being vigorous, and the leaves ele-

gantly lobed, velvety green with grey variegation above, and covered with soft, pale cinnamon-brown pubescence beneath. This plant differs from *R. reflexus* as represented in *Bot. Mag.*, t. 7716 (1900), mainly in the grey variegation of the leaves; in their form, pubescence, and spines there is no difference. This figure was prepared from a plant which for years has clothed a pillar in the Temperate-house at Kew, where it blooms freely in August, the flowers, like those of the common Blackberry, white, $\frac{3}{4}$ -inch across; but it does not ripen fruits. There is a marked difference between this and *R. moluccanus* as grown at Kew for many years, both in the Palm-house and Temperate-house, where it climbs to the top of a pillar 20 feet high, and produces in autumn large clusters of purple fruits, larger than the largest of Blackberries, and as juicy and sweet. This plant has orbicular, lobed, rugose leaves, with a whitish pubescence on the under side; it also produces much stouter shoots than *R. reflexus*. It will be seen from what is here stated, that the plant shown at Ghent by M. Duval, and afterwards at the Drill Hall by Mr. Lloyd, is *R. reflexus*, and not *R. moluccanus*, although it is figured under the latter name in the last volume of the *Gardeners' Chronicle* (see p. 309). [*R. reflexus* is made synonymous with *R. moluccanus* in the *Kew Index*, and in the *Kew Hand-List of Tender Dicotyledons*, ED.] For garden purposes we might adopt the name of *R. reflexus pictus* for this plant, to distinguish it from the green-leaved type. I send herewith leaves of the former and of *R. moluccanus* for comparison. *W. Watson, Kew.*

CULTURAL MEMORANDA.

EUPHORBIA (POINSETTIA) PULCHERRIMA.

The following method is a good one by which to obtain fine plants. Some old plants should now be planted in a cold pit, and the atmosphere kept close until they are established, when the lights may be removed. By September the plants will have made several strong growths; and the tops of these, about 3 inches long, should be taken off and inserted in 3-inch pots, in which pots they will flower. Plunge them in a propagating case having a brisk bottom heat as soon as they have made roots; remove the young plants to a shelf in a temperature of 60°, and shade for a few days from sun. When they are growing freely, feed them occasionally.

To prevent Poinsettia cuttings from bleeding to great extent, cut the stem halfway through; in a week's time the cut portion will have caloused, when the other half can be severed. Cuttings taken in this way will root much more quickly than those taken at one cutting. *J. Murray, Sopley, Christchurch.*

The Week's Work.

PLANTS UNDER GLASS.

By **J. MAYNE**, Gardener to the Hon. MARK ROLLE, Bilton, Budleigh Salterton, Devonshire.

Gardenias.—Repot young plants before they become pot-bound. The pots in which they will flower need not exceed 6 inches in diameter, and unless the available loam contains much fibre, let peat form the major portion of the compost, adding a good proportion of sand. Pot firmly, and afford the plants a warm and moist atmosphere until growth is finished.

Bouvardias.—In the warmer counties these plants succeed out-of-doors during the summer if placed in partial shade. Ours are stood under a north wall at 2 feet from the base, where they get sunshine in the mornings and evenings. Pinch the shoots at the second joint during the next four or five weeks. Examine the plants frequently to ascertain if any need water at the root, and syringe them overhead on fine evenings. Any requiring more root space should be repotted, and a neat stake put to each plant, to which the principal branches may be supported with a band of raffia. Turn round the plants each week to prevent them becoming one-sided.

Young plants that were rooted this spring should be kept under glass for another month.

Humea elegans needs to be afforded water with very great care; a little weak manure water may be given them once a week. They show to the best advantage if not tied up stiffly, and are suitable for planting singly in vases. Seed may now be sown in shallow pans for next year's supply, the pans being filled to within 1 inch of the rim with equal parts of loam and leaf-soil, to which should be added sand and a small quantity of powdered plaster or lime-rubble. The drainage must be perfect. Water the soil an hour or so previously to sowing the seeds, and cover them very slightly. Put the pans in a cold pit or frame, and shade from the sun until germination has taken place. Prick out the seedlings into other pans as soon as they become fit.

Hydrangeas.—Plants rooted in March or April will need a shift into $4\frac{3}{4}$ -inch or $5\frac{1}{2}$ -inch pots. The first-named pot is quite large enough for the weaker-growing variety, Thomas Hogg. Let the compost consist principally of loam, with a sprinkling of bone-meal. Pot firmly, and return the plants to a cold frame until re-established. They may then be placed in a sunny position out-of-doors, so that the growth may get thoroughly ripened. In respect to the white variety, Thomas Hogg, I pinch out the point as soon as the cuttings are rooted. These plants, if well ripened, should carry from three to five heads of bloom. Cuttings of half-ripened shoots may still be inserted singly in small pots, which I place under a hand-glass in a shady corner, and keep moist and close until rooted. These late plants should not be pinched, and should be potted finally early next year. Old plants, if intended for another year's service, should be cut back after flowering, and afforded a little heat and moisture, until they have made growth 2 inches in length, when they may be afforded larger pots if it is considered to be necessary, and may then be placed out-of-doors. *H. paniculata grandiflora* is useful for late flowering, and should be fed twice weekly until the flowers begin to expand.

THE FLOWER GARDEN.

By **J. C. TALLACK**, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

Tulips.—It is a moot-point as to whether the late flowering Tulips should or should not be lifted annually. My experience is that in light, sandy soils the bulbs may safely be left for two or three years at the least, but that on the whole it is best to lift them, and the present is an excellent time for so doing. When the old flower-stems can be twisted round the finger without breaking, the bulbs are fully made up. One reason for lifting, especially where the soil is not of the best for Tulip culture, is that it affords an opportunity for sorting the bulbs and reserving the best for planting in the more important positions, thus eliminating the chance of there being vacancies where these would be most undesirable. I do not advise the throwing away of the small bulbs, as if these are planted in the reserve garden they will probably make excellent bulbs for planting the next year or later. In most gardens Tulips are undersized this year owing to hailstorms and cold having injured the leaves, which did not allow of the bulbs finishing up satisfactorily.

Hesperis matronalis flore pleno.—The double white Rocket, although a favourite plant in most gardens, is seldom met with in good condition, it not being a very easily grown plant. Better results than are usually observed would follow if the flower-stems were cut quite down to the ground as soon as the flowering is over, and the side shoots taken for making cuttings late in the month of August. These shoots root quickly, and make strong plants. Leaving the flower-spikes on a plant prevents the growth of side-shoots, or at any rate these growths do not become strong.

Bedding Plants.—Gaps in the flower-beds may be filled up from the reserve of plants. At Shipley, I am now planting out Cannas, as until quite recently the weather has been too cold for them; but now, given warm weather and plenty of manure in the soil, the plants will be in good form by early autumn—a time when Cannas are

most appreciated. Fuchsias, if the flowers are not yet wanted, will be much relieved by the removal of the flower-buds, and to do so will tend to keep the plants in flower till late in the year.

Bedding Plants in Baskets or Vases.—These must receive close attention in the matter of affording water, and some kind of mild liquid manure.

Gladiolus.—These are much benefited by a dressing of guano, followed by a copious application of water. When well nourished in this manner, the corms that appeared small when planted will grow to large sizes, and often afford finer spikes than those obtained from corms of a larger size, which frequently have an unfortunate habit of going off with the "yellows" just as they should be throwing up good flower-spikes.

Dahlias should receive plenty of manure, and have water copiously applied when the weather is hot and dry. Few plants repay good cultivation better than Dahlias. Let the growths be tied-in fairly closely, as if neglected in this particular, high winds cause much harm.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq., Dromore, Maidenhead.

The Fig.—The sunless weather of the past few weeks has been unfavourable to growth and to the ripening of the fruits, and in order to make the most of sunshine, remove every shoot that is not required for extension or for fruiting next year. The overcrowding of the shoots is a potent cause of immaturity in the wood, and consequent shyness to bear; moreover, such embryo fruits as there are do not winter satisfactorily, and light crops are the result. Secure the shoots to the wall with ties of bast or with nails and shreds; train a young shoot over each main branch, as sun scorching from full exposure will sometimes cause a check, and result in the loss of many of the fruits. See that the trees are well supplied with water, especially on light soils, and apply a mulch of farmyard manure over the roots. If red-spider should appear on the leaves, forthwith apply an insecticide, and heavily syringe the foliage once a day.

Out-of-door Vines.—Let the young shoots be fastened to the walls betimes, for being sappy and brittle, the wind causes much havoc. A foot space is not too much to leave between the shoots in the case of Royal Muscadine, and 1½ ft. to 2½ ft. between those of Sweetwater and Black Prince varieties. Stop the shoots at the third or fourth leaf beyond the bunch, and stop all lateral shoots at the first leaf beyond the point of origin. As soon as the fruit is set, begin to thin, and thin freely. Very good Grapes can be and are grown on south walls in the south and west of England when proper attention is given the Vines. Cheap foreign Grapes has put out-of-door Vine-cultivation in this country in the background. Still, very nice bunches of Sweetwater, Black Prince, and other varieties can be obtained in most seasons from walls facing south.

Currants and other Small Fruits.—If the birds are troublesome, all fruit having attractions for them should be enclosed in nets attached to light posts, planks being employed at the ground-level, to which the edges of the nets may be attached; and if enclosures be erected 7 feet high, it is preferable to laying the nets on the plants.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PLOTT, Bart., Wexham Park, Slough.

Celery.—The earliest plants should now be examined, and all side growths and split leaves carefully removed; and if the weather be dry, water must be freely applied, as well as liquid-manure occasionally. No earthing-up should be done unless the plants are full-grown and heads are required for some special early occasion. Celery at this season requires from five to seven weeks to blanch properly. Keep late crops well supplied with moisture, both at the root and likewise overhead, in hot weather; and let the soil in the trenches be stirred with the hoe—a capital aid to the quick growth of plants. Late sowings should be planted-out, if this be not already done.

Coleworts should be planted-out as fast as the summer crops are cleared away, choosing if possible showery weather for carrying out the work; and if hot and dry, puddling the plants, and affording a thorough application of water when the planting is finished. Plant in drills drawn 15 ins. apart, and allow a space of 12 ins. from plant to plant. Make a sowing on a south border of the Rosette and Hardy Green Coleworts, to come into use late in the year, and early in the spring; these withstand the rigours of winter much better than those of the earlier sowings.

Endive.—Make sowings of the Batavian and curled-leaved varieties; and thin the earlier sowings as soon as these are ready, planting some of the thinnings in a shady part of the garden, affording the plants plenty of water at the time, and as often afterwards as may be necessary.

Lettuce.—Where salads are much liked, it is advisable to make small sowings at intervals of ten days, and thin out the plants as soon as they are fit to be handled, planting some of the thinnings on a border facing north, and taking care not to let the plants lack water.

Cauliflowers with heads turning in should have the latter covered by breaking down a few of the leaves over them, or by tying the leaves together. If the heads are turning-in faster than they can be consumed, pull up, bind the roots in damp moss, and hang them head downwards in a cellar or other cool place, syringing them lightly twice a day. The Walcheren and Magnum Bonum varieties, if planted on a south border on well-manured and deeply-dug land, yield small white heads that are much valued for the best table.

Tomatos.—The out-of-doors plants should have their shoots thinned and trained. They are best grown on the oblique cordon system, as by this method the fruit is well exposed to sunshine. The soil should be often stirred with the Dutch-hoe, and when the fruits are in course of development, liberal top-dressings of rotten manure should be afforded.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury

Odontoglossums newly imported.—Many thousands of newly imported plants have been distributed during the last month, and a few hints as to the proper treatment of such plants may not be out of place. These plants are usually in a greatly shrivelled condition, requiring careful management. During the first week after arrival at the purchaser's, the shading afforded should be of a heavy description, but after that period the ordinary shading of the Odontoglossum-house will suffice. The plants should not be placed directly on arrival in their pots, but stood upright in shallow boxes on some moist sphagnum. Before putting them in the boxes, let all decayed and useless stuff be removed. No over-head syringing is called for till a beginning of growth is observable. When signs of growth have become general, pot up the plants, and treat in the usual manner.

Cochlioda noctliana and *C. vulcanica* are pretty Orchids, now in flower in the Odontoglossum-house. The plants are of small growth, and should properly be cultivated in pans, which should be suspended from the roof, or afforded a light position on the stage. The same sort of compost as that which I recommended for Odontoglossums is suitable for Cochliodas, making it moderately firm about the roots. The repotting of any that require it may be carried out at this part of the season, when the new growths have reached a height of about an inch; but on no account should the plants be disturbed at the roots if it be not really necessary. The plants need a good supply of water when in full growth.

Calogyne Dayana.—This beautiful species might now be afforded a shift into a larger pan or basket, if the materials need renewal. Large specimens, the compost of which may be in a sour condition, may be broken up and replanted in a rough porous compost consisting of equal parts of turfy peat and turfy loam and half-decayed leaves, a small quantity of sphagnum chopped up, and silver-sand. This plant is not a difficult one if it be given a position in a warm house,

where it can be freely syringed, and is afforded liberal supplies of water at the roots whilst making its growth. It should be kept comparatively dry while resting.

Lælia cinnabarina.—We have in this plant a parent of several handsome crosses, such as *L. Latona*, *L. c. Highburyensis*, *L. c. G. S. Ball*, *L. c. cinnabrosa*, *L. c. Hippolyta*, and others. These produce handsome spikes of flowers under good cultivation. They, as well as the parent plant, should be grown in the lightest part of the Cattleya-house, and be afforded water in abundance, and be syringed overhead when making their growth. The present affords a suitable time at which to repot or top-dress them.

FRUITS UNDER GLASS.

By T. H. C.

Peaches and Nectarines.—Do not neglect trees from which the fruit is consumed, but syringe them at least once daily so as to keep the foliage free of insect pests; and be as particular as formerly in applying water to the borders whenever necessary, with or without manure, according to the vigour and cropping capabilities of the trees. Leave the ventilators open continually to their widest extent, and shut off artificial heat. Cut out all superfluous shoots, so that those left for next year's fruiting may have the full benefit of sunshine and air.

Melons.—At this season newly planted-out Melons make rapid growth, and in order that this may not be of too soft and unfruitful a nature, the soil should consist of a good, fairly heavy loam, to which is added a small quantity of mortar-rubble and charred garden refuse, but no manure of any kind. In a soil of the above kind the bine will grow of a moderate degree of strength, and the flowers will set readily. When the fruits are swelling, the subsequent treatment will consist of rich top-dressings applied occasionally, plenty of weak liquid-manure, and an occasional sprinkling of an artificial fertiliser, which should be immediately followed by an application of water. Do not apply water quite close up to the stems, especially if the soil be retentive, as if this be coupled with imperfect ventilation, damping-off just at the soil-level may occur. Should decay set in, dust the affected part with quicklime or charcoal powder, and repeat the application till the tissues have dried up. Ventilate freely in fine weather, close early with plenty of atmospheric humidity, and syringe the plants thoroughly. The temperature may rise at closing time to 90°. In order to prevent red-spider from getting a footing on the plants, syringe the foliage vigorously with tepid water; and if aphides appear on the plants, employ XL-All. Let seeds be now sown for affording plants for fruiting in the months of September and October. Plants carrying fruit of full size should be afforded water cautiously, or splitting may occur. Make sure that the fruits are supported in nets or on square pieces of wood. Do not be in haste to dry off the borders which contain plants having ripening fruit, but apply as much water as will bring to maturity naturally the fruits which are a few days behind the earliest in point of ripeness. Ripe fruits may be kept in good condition for a considerable length of time by being placed in a dry, airy fruit-room, choosing perfectly sound specimens.

Cucumbers.—Let all fruits be cut when of a serviceable size, not keeping them on the plants till full-grown. The variety Improved Telegraph is an abundant cropper, so much so as to make it necessary to thin the fruits in the early stages. Apply rich top-dressings as soon as the roots come to the surface, and, except in the case of very young plants, apply water daily if necessary, and occasionally afford liquid-manure. Remove some of the old bine and foliage without causing a check; that is, do this little and often, laying-in young shoots to take the place of the old. Afford air whenever the weather is favourable, maintain a humid air in the house or pit at all times, and syringe the foliage early in the morning and at closing time. Keep a temperature at night of 70°, and by day 10° to 15° higher. Deal with insect pests as advised for Melons.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the **EDITOR**, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 4	{ Société Française d'Horticulture de Londres, meet. Rose and Horticultural Shows at Sutton and Walton-on-Thames.
TUESDAY, JULY 7	{ Royal Horticultural Society's Committee. Lecture on "Hardy Irises." Wolverhampton Floral Fête (three days). Rose and Horticultural Shows at Gloucester and Harrow.
WEDNESDAY, JULY 8	{ Rose and Horticultural Shows at Farningham, Hereford, Croydon, Stevenage, and Ealing.
THURSDAY, JULY 9	{ Rose Shows at Bath, Eltham, and Woodbridge.
FRIDAY, JULY 10	{ Royal Botanic Society: Lecture. Rose Show at Ulverston.
SATURDAY, JULY 11	{ Royal Botanic Society Meet. Rose and Horticultural Society at Manchester Botanical Gardens.

SALES FOR THE WEEK.

FRIDAY, JULY 10—

Orchids in great variety, by order of Messrs. Sander & Sons; and private collection, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12 30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick —63°2'.

ACTUAL TEMPERATURES:—

LONDON.—July 1 (6 P.M.): Max. 78°: Min. 58°.

July 2 (Noon): Fine; warm, 91°.

PROVINCES.—July 1 (6 P.M.): Max. 73°, Eastern Counties; Min. 55°, Shetland.

A WEEK ago no one, in the Home Counties at any rate, would have ventured to predict the occurrence of such a good show of Roses as was to be seen in the Temple Gardens on Wednesday last. True there were some blank places, true the quality was not of surpassing excellence, but for all that it was very good indeed. The National Rose Society is so whole-hearted, and its officers so energetic and so courteous, that they deserve to succeed; and they have done so. The weather was all that could be desired, though towards midday the "Princesses" and "Countesses," the "Souvenirs" and the rest of them began to show signs of distress, and made us wonder what they would look like if a second day's trials were superimposed on the first. The details of the Show are duly chronicled in our report. We can only

notice here some special features of interest. The first note is one of surprise at the excellence of the exhibition as a whole, after such a period of stress as we have gone through. The next note is one of great satisfaction that the reign of ugly boxes is doomed. For specialists' purposes, or for the adjudication of new Roses, they may last a little longer, but no one who saw the beautiful effect produced by showing Roses with long stems in vases will care to prolong the stereotyped mode of exhibiting. The "new" Roses had a tent all to themselves, but we cannot say they deserved such a distinction.

In the Champion class in the Nurserymen's classes, Messrs. HARKNESS were placed first, probably because on careful scrutiny individual blooms may have been found rather weaker in the principal competing group of Messrs. B. CANT & SONS. In the Amateurs' section Mr. LINDSELL took first honours, followed by Mr. ORPEN. The Challenge Cup for Teas and Noisettes was won by Mr. A. HILL GRAY. The groups of garden Roses were mostly too heavy and dense to be quite satisfactory.

The table decorations were very charming. The first prize went to Mrs. ORPEN, who showed a very simple and refined group of single Roses, intermixed with Adiantum and trails of Myrsiphyllum—not very original in conception, but delightfully carried out. Mrs. HOLLAND took the second prize with vases of Mrs. Grant Rose, intermixed with long trails of bronzy Selaginella. For further details we must refer to our report; but in the meantime we may offer our congratulations to the Society, and our thanks to its officers, who were assisted on this occasion by the staff of the Royal Horticultural Society.

ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Flower Show of the Royal Horticultural Society will be held on Tuesday, July 7, in the Drill Hall, Buckingham Gate, Westminster, 1 to 5 P.M. Lectures on "Hardy Irises" will be given by Miss ARMITAGE and Mr. CAPARNE, at 3 o'clock.

—At a General Meeting of the Society held on Tuesday, June 9, 132 new Fellows were elected, amongst them being the Earl of MUNSTER, the Countess of LUCAN, Sir ALGERNON WEST, K.C.B., Sir WILLIAM EDEN, Bart., Lady LIDDELL, Lady MEYRICK, and Lady YOUNG, making a total of 900 elected since the beginning of the present year.

THE OLDEST HERBARIUM.—Prof. O. PENZIG, of Genoa, is now in Rome, studying the ancient herbarium of Gherardo Cibo, made before 1540. It is a very interesting and well-preserved collection, and has been found in the Biblioteca Angelica in Rome. If we except the mummy wreaths of Egypt, this may be taken to be the oldest herbarium in the world.

NEW PUBLICATIONS.—*Handbuch der Laubholz-Benennung...bearbeitet von L. BEISSNER, E. SCHELLE, and H. ZABEL.* Berlin: PAUL PAREY. A valuable list of hardy shrubs and trees, to which we must refer shortly. *Orchids, their Culture and Management.* By W. WATSON and H. J. CHAPMAN. L. UPCOTT GILL, Bazaar Office, Drury Lane.

THE COMMISSARIAT AT THE ROYAL HORTICULTURAL SOCIETY'S MEETINGS.—We have received various communications on this subject, but as they seemed rather to be matters of

domestic concern than of public interest, we referred the writers to headquarters. The Holland House show has brought us further remonstrances, so that we feel constrained to call the attention of the authorities thus publicly to the matter. The complaint is that the charges are excessive and the quality not adequate.

SIR DANIEL MORRIS, K.C.M.G.—Those who remember Dr. MORRIS's strenuous work at Kew and at the Royal Horticultural Society will be gratified to learn of the honour that has been conferred on him. Sir DANIEL has shown such whole-hearted energy in the development of the agricultural resources of British Honduras, and more recently of the West Indies, that it is satisfactory to find the Government recognising in this way the efficiency of their officer. Sir DANIEL's chief aim has been to enforce the lesson that the agricultural welfare of the Colonies is to be increased mainly by the application of the resources of science. To that end he is leaving no means untried to promote the diffusion of knowledge, and to teach the cultivators the best means of turning their resources to account.

THE WINDSOR ROSE AND HORTICULTURAL SHOW, we are informed by Mr. W. TITT, Honorary Secretary, was postponed from last Saturday, owing to lateness of season, and will be held to-day, July 4.

SWEET PEAS.—It is estimated by a correspondent of the *Florists' Exchange* that the crop grown in America amounts to 500 tons annually. One firm at Santa Clara, California, has about 300 acres devoted to this purpose, and harvested recently 100 tons of seed.

"AMATEUR GARDENING."—We have pleasure in welcoming the thousandth number of *Amateur Gardening*, which is a little paper very useful to those for whom it is intended, especially considering its low price. It celebrates its thousandth appearance by the publication of a coloured plate of hardy Gaillardias; and there are various other illustrations.

THE GREAT EASTERN RAILWAY COMPANY'S TOURIST GUIDE TO THE CONTINENT.—This well-known guide-book, illustrated by PERCY LINDLEY, comes to us with new illustrations and particulars of tours in North Germany and Tyrol, Norway, Denmark, Sweden, and other holiday haunts, and is therefore as good as or even better than usual. The pictures are charming, and the maps useful for the intending tourist.

ASPLENIUM EBENOIDES.—An interesting instance of a Fern hybrid's bearing upon botanical science is found in the case of the rare Fern known as *Asplenium ebenoides*. In all botanical manuals this is set down as a good species, but there has always been a suspicion that it is a natural hybrid—a theory which its extreme rarity and irregular occurrence seemed to bear out. Its indicated parents were *Asplenium ebenum* and the Walking Fern (*Campytosorus rhizophyllum*), members of totally different genera. Acting on this suggestion, Miss MARGARET SLOSSON recently planted sections of the prothallia of these two Ferns together, and had the satisfaction of raising, not *Asplenium ebenum* or the Walking Fern, but true *Asplenium ebenoides*. Thus, after nearly fifty years, this Fern has been proved to be really a hybrid. W. M. Clute, "*Fern Bulletin*."

PEACH BLISTER has, if we may judge from the numerous specimens that have reached us, been unusually prevalent this year. It is the work of a fungus, *Exoascus deformans*, which causes swellings and deformity of the leaves. Nothing can be done at the time. It is one of those many cases where prevention is far better

than cure so called. Spraying with Bordeaux Mixture in spring, before the leaves expand, affords the best chance of success. It must be remembered that the mixture is apt to burn the young leaves, hence it should be used before they expand.

"THE WORLD'S WORK."—The summer number of *The World's Work* contains an article on the Day's Work in Kew Gardens, illustrated from photographs. The account is popular rather than technical, but aims at giving an idea of the work done in the several departments. This will perhaps surprise the casual visitor, who thinks of the Gardens as merely an improved form of

glaucous leaves and racemes of white bell-shaped flowers; *Ozothamnus thyrsoideus*, apparently very near to *Helichrysum rosmarinifolium*, a shrub with linear revolute leaves and numerous cylindrical white flower-heads, spreading at the tops like little stars, and *Deutzia candidissima*.

MR. DUTHIE.—We learn that this gentleman has retired from the post of Director of the Botanical Department of Northern India, and Director of the Botanic Garden, Saharanpore.

ACETYLENE LIGHT AS A MOTH-TRAP. — A correspondent in France recently inquired for particulars relating to the use of acetylene lamps

put in action at dusk, preferably on dark nights. On the first night one lamp caught 4,600 pyralids and 218 moths of other kinds. During July the lamps average 3,500 insects a lamp a night. The expense of the lamps is reported to have been 2 cents a night each, or 2½ cents a night an acre. It is said that this method of catching noxious insects is more efficacious than any method which has been tried before. Special cases require special remedies, but that is no reason why moths should be caught indiscriminately, many friends as well as enemies being thus destroyed. It is never safe to use moth-traps unless the "catch" is examined by an entomologist to determine of what it consists.

THE ROTHAMSTED EXPERIMENTAL STATION. — On June 18 a party of about eighty farmers from Essex, conducted by Mr. T. S. DYMOND, of

FIG. 4.—HEDGE OF AYRSHIRE ROSES IN THE GARDEN ATTACHED TO MESSRS. B. R. CANT AND SONS' NURSERY, COLCHESTER.
(Photographed by F. Mason Good.)

recreation ground, and the illustrations of the Director's room and of the laboratory will give him a glimpse into portions inaccessible to the general public, who have no idea of the amount of work done at Kew in developing the resources of our colonies and in promoting the sciences on which all successful cultivation depends. Other articles in this July number deal with Fruit and Flowers in Guernsey (illustrated), and with Where Farming Pays in England, which is a brief account of work in the Fen district.

MORE CORNISH PLANTS.—Messrs. GAUNTLET, of Redruth, send us flowering specimens of *Olearia macrodonta*, *Escallonia Langleyensis*, mentioned in our last issue, also of *Andromeda cassinæfolia*, now called *Zenobia speciosa*, with

for the capture of cockchafer. The following extract may be suggestive:—

WHOLESALE SLAUGHTER OF MOTHS.—The vineyards in the wine-growing districts of Beaujolais, France, have suffered greatly from the depredations of night-flying moths, among which the pyralid was the most prominent. The following method of killing these insects has been adopted, and *The Electric Review* pronounces it a success. "Calcium carbide and water are combined for the generation of acetylene gas, and burners giving a light of ten-candle-power are mounted above each generator. Six ounces of carbide is said to be enough to keep the flame going for as many hours. Eight inches below the burner is adjusted a shallow circular dish, 20 inches in diameter. A little water is poured into this, and a thick film of kerosene is deposited on the surface of the other fluid. Thus is completed a trap to which the moths are attracted by the flame. According to the authority just quoted, these generators are set up about 550 yards apart, and are

the Essex County Laboratories, visited the Rothamsted Experimental Station, and were taken round the plots by the Director and the staff. Visits were also made on the 19th by a similar party of about forty farmers from east Herts, and on the 27th by a small party of the members of the German Agricultural Society visiting England for the Royal Agricultural Society's show. The plots at the present time are particularly interesting, especially the Broadbalk Field, which is carrying its sixtieth successive Wheat crop, and the permanent grass-land, which has been under the same treatment for the last forty-eight years.

THE CANTERBURY GARDENERS' SOCIETY will hold a Chrysanthemum Show on November 11 and 12.

ROSES, AND HOW TO GROW THEM.

If readers do not know how to grow Roses, the inability does not arise from want of preceptors. The actual number of Roses in general cultivation is not so very much greater than the number of teachers. This being so, it follows that there must be differences in quality of the would-be instructors. Some are specially good; some are the products of actual experience and judgment; others are mere compilations, in which the smell of paste overlays the fragrance of the Rose. Some excel in particular departments, some treat the matter technically, and some lighten the details with wit and humour, and some overload their pages with trite banalities and worn-out sentimentality.

There is a great deal of sound common sense in Miss [P] Violet P. Biddle's little book,* and no superfluous verbiage. The varieties selected for comment are among the best of their kind, and the reader is not bewildered by lengthy catalogues. The author has not studied her *Chronicle* lately, or she would not mis-spell "Felicité-Perpetué"; and a fuller index is desirable. Mr. Horace Wright contributes a chapter descriptive of some of the best of the more recently introduced Roses.

So many are the books about Roses that it is difficult to find distinctive titles for them. Mr. John Weathers has selected one to which no objection can be taken, for we have yet to see a Rose which is not beautiful.† Mr. Weathers enumerates the leading varieties under the headings to which they belong, such as Hybrid Perpetuals, Teas, Hybrid Teas, and so forth, and indicates the methods of cultivation and pruning. Historical details, which are of little concern to the ordinary Rose-grower, but which are so full of interest to the intelligent student, are not forgotten. To him also the details of the how, why, and because of pruning will be very serviceable. A general index, and a special index of the Roses mentioned in the text, are given, and no fewer than thirty-three coloured plates are provided, in which the colour of the flowers is more correctly indicated than is often the case; but the rosarian will be reminded of the extreme difficulty experienced in attempting to reproduce the exquisite shades of colour and the texture of a Rose.

The tenth part of the reissued *Century Book of Gardening* (George Newnes) contains an article on "Exhibition Roses" by Mr. Edward Mawley. Nothing further need be said to commend it to the reader.

The Rose Garden. By William Paul, F.L.S. Tenth edition. (London: Simpkin, Marshall, Hamilton, Kent & Co., 4, Stationers' Hall Court.) We learn that it is fifty-five years since this well-known book first appeared, and now, with further revisions and additions, it is brought forward for the tenth time. It is not greatly altered in general scheme and scope, but there are new articles, or rather re-written ones, on the botany and entomology of the Rose; new varieties are described, and mention of certain older ones is withdrawn. The illustrations have increased in number, and the coloured plates show us some of the newest sorts of Roses. The book is such an old friend to all rosarians, that to mention its reappearance is a sufficient recommendation—to praise it would be an impertinence, but we cannot help saying it is the best of its class.

Of the *Livre d'Or des Roses* (Paris: Lucien Laveur) we propose to speak on another occasion; suffice it to say now that it consists of a series of quarto coloured plates with illustrative text, in course of publication at regular intervals. . . .

SOCIETIES.

THE NATIONAL ROSE. (METROPOLITAN EXHIBITION.)

JULY 1.—The annual exhibition of the National Rose Society was held in the Inner Temple Gardens, Thames Embankment, London, on Wednesday last, in glorious weather. The tents employed were the same as those of last year, and measured 460 feet in length and 40 feet in width. The show was so much better than the most sanguine could have anticipated a week ago, that few were inclined to criticise the blooms adversely; but it is doubtless true that although they were equal, or nearly equal, to those exhibited a year ago, the general standard was below that of the National Rose Society in a propitious season.

No Gold Medal was awarded to new varieties, but four of those exhibited were commended. The arrangements worked very smoothly in the hands of the courteous honorary Secretary, Mr. Ed. Mawley, assisted by Mr. S. T. Wright, Mr. Reader, and Mr. Thos. Humphreys, officers of the Royal Horticultural Society.

NURSERYMEN. MIXED ROSES.

The Champion Trophy and Gold Medal of the Society accompanied the 1st prize for—

Seventy-two blooms distinct varieties.—There were five exhibits in this large class, as against five last year. The 1st prize was won by Messrs. HARKNESS & CO., Hitchin, Herts. The varieties were: *Back row*, Caroline Testout, very fine; Elienne Levet, White Lady, Helen Keller, Bessie Brown, Dupuy Jamin, Cleopatra, Duke of Teck, Mrs. R. Garrett, La France de '89, Maman Cochet, Rev. A. Cheales, Boadicea, Dr. Sewell, Mons. Noman, Gustave Piganneau, Duchesse de Vallambrosa, A. K. Williams, Lady M. Fitzwilliam, François Michelson, Frau Karl Druschki, Marquise Litta, Marchioness of Downshire, and Ulrich Brunner. *Centre row*, Grand Mogul, Souvenir de S. A. Prince, Prince Arthur, Souvenir de Président Carnot, Madame Delville, Mrs. Ed. Mawley, Duke of Connaught, White Maman Cochet, Mildred Grant, Mrs. John Laing, E. Y. Teas, Jean Ducher, General Jacquemiot, Madame Gabrielle Luizet, Horace Veroet, Mrs. W. J. Grant, Suzanne-Marie Kodocanachi, Madame Jules Grolez, Duke of Edinburgh, Marchioness of Londonderry, Comte de Raimbaud, Laurence Allen, Souvenir de Pierre Notting, and Golden Gate. *Front row*: Souvenir d'un Ami, Xavier Olibo, Souvenir d'Elise Vardon, Duke of Wellington, La France, Queen of Queens, Madame Hoste, Earl of Dufferin, Madame de Willemoz, Viscountess Folkestone, Pride of Waltham, Comtesse de Ludre, Madame Cusin, Kaiserin Augusta Victoria, Hon. Edith Gifford, Countess of Rosebery, Margaret Dickson, Marie Baumann, Luciole Clara Watson, Exposition de Brie, Madame Hausman, exceedingly bright, Countess of Caledon, and Ulster. The 2nd prize exhibit, from Messrs. B. R. CANT & SONS, The Old Rose Gardens, Colchester, was not much inferior to the one already described, but it was a little marred by several weak specimens. The following varieties were amongst those represented in best condition:—Le Havre, White Lady, Countess Oxford, Papa Lambert, Empress Alexandra, Mildred Grant, Bessie Brown, Mrs. Ed. Mawley, Countess Caledon, Rubens, Mrs. John Laing. The 3rd prize was won by Messrs. FRANK CANT & CO., Braiswick Rose Gardens, Colchester, who had an excellent bloom of the new white Rose Frau Karl Druschki. The unsuccessful exhibitors were Messrs. D. PRIOR & SON, Colchester; and Messrs. A. DICKSON & SONS, Newtownards, Ireland.

Forty distinct varieties (trebles).—There were four exhibits in this class, and the number last year was three. This year therefore, the class contained 480 blooms. The 1st prize was won by Messrs. B. R. CANT & SONS, and amongst the varieties shown, those following appeared most effective:—A. K. Williams, Bessie Brown, Helen Keller, Mrs. W. J. Grant, Mildred Grant, Frau Karl Druschki, Mrs. Sharman Crawford, Ulrich Brunner, Medea, Mme. Gabrielle Luizet, Hélène Guillot, and Prince Arthur; 2nd, Messrs. ALEX. DICKSON & SONS, Ltd; and 3rd, Messrs. F. CANT & CO.

Forty-eight Blooms, distinct varieties.—Four competitors entered in this class, and generally the blooms were of satisfactory quality. Messrs. G. & W. H. BURCH, Peterborough, won 1st place, showing the following varieties: *Back Row*, Caroline Testout, Marquise Litta, La France, Tom Hood, Viscountess Folkestone, Marchioness of Downshire, Margaret Dickson, François Michelson, Mrs. John Laing, Countess of Oxford, Charlotte Guillelot, Gustave Piganneau, Clio, Mrs. W. J.

Grant, Denmark, and Her Majesty. *Centre Row*, Ulrich Brunner, Lady Mary Fitzwilliam, Rev. Alan Cheales, Bessie Brown, Horace Vernet, Mrs. Ed. Mawley, Duke of Edinburgh, Luciole, Frau Karl Druschki, Madame Cadeau Ramey, Ulster, White Lady, Duchess of Bedford, Medea, Marie Baumann, and Bladud. *Front row*, Antoine Rivoire, Augustine Guinousseau, Xavier Olibo, Lady Clanmorris, Madame Hoste, Countess of Caledon, Anne Oliviere, Comte Raimbaud, Mrs. Sharman Crawford, Dr. Sewell, Rubens, Exposition de Brie, Souvenir de Président Carnot, Gabriel Luizet, Maman Cochet, and Madame Eugène Verdier. Messrs. HUGH DICKSON & CO., Royal Nurseries, Belfast, had a pretty collection of blooms of moderate size but good colour, and were awarded 2nd prize; 3rd, J. BURRELL & CO., Cambridge.

Twenty-four blooms, distinct varieties.—In this class, in which the selection is much less wide, the blooms shown are frequently amongst the best in the show. On this occasion a very good collection was exhibited by Mr. GEO. MOUNT, of Canterbury (1st), his selection of varieties being as follows:—*Back row*, Caroline Testout, very large sized, good blooms; Ulrich Brunner, Mildred Grant, Xavier Olibo, Frau Karl Druschki, Mrs. J. Laing, Marquise Litta, and Bessie Brown;—*Centre row*, Prince Arthur, Killarney, General Jacquemiot, La France, Lady M. Beauclerk, an exceedingly pretty pink-coloured Rose with broad petals, having crimped or frilled margins; Madame C. Ramey, Duke of Edinburgh, Lady Mary Fitzwilliam. *Front row*, Mrs. W. J. Grant, Souvenir de Président Carnot, Mrs. Sharman Crawford, Viscountess Folkestone, Margaret Dickson, Kaiserin Augusta Victoria, Madame Gabrielle Luizet, Mrs. Ed. Mawley; 2nd, Mr. CHAS. TURNER, Royal Nurseries, Slough; and 3rd, Mr. THOS. RIGG, Rose-grower, Caversham, Reading. There were six exhibitors.

Twenty-four distinct varieties, trebles.—The 1st prize in this class went to Slough, Mr. CHAS. TURNER having won with a very creditable collection; 2nd, Mr. GEO. MOUNT; and 3rd, Messrs. HUGH DICKSON & CO., Ltd. The exhibits in this class were of good quality throughout.

TEAS AND NOISETTES.

The principal class for Teas and Noisettes called for 24 single trusses of distinct varieties, and the 1st prize was won by that distinguished cultivator of Tea Roses, Mr. GEO. PRINCE, of the Longworth Nurseries, Berkshire. His selection of varieties was as follows: his *back row* commenced with a grand bloom of Mrs. Ed. Mawley, of very large size and capital colour, which obtained the Society's Silver Medal for the best Tea or Noisette bloom in the show; continuing, the varieties were White Maman Cochet, Souvenir d'un Ami, Medea, Muriel Grahame, Cleopatra, La Boule d'Or, and Maman Cochet. *Centre row*: Mme. Hoste, Souvenir de S. A. Prince, Lady Roberts, Princess of Wales (very poor), Princess Beatrice, Mme. de Watteville, Empress of Russia, and Devoniensis. *Front row*: The Bride, Countess de Panissa, Golden Gate, Cornelia Koch, a very pretty bloom of Comtesse de Nadailac, of moderate size, Alba rosea, Souvenir de Pierre Notting, and Bridesmaid. Messrs. D. PRIOR & SON, who were 2nd, had good blooms of Maman Cochet, Cleopatra, Rubens, and Innocent Prola. 3rd prize, Messrs. FRANK CANT & CO. It is commendable to the variety that in each of these collections the best bloom was one of the excellent Mrs. Mawley, named in compliment to the wife of the respected Honorary Secretary to the Society.

Twelve blooms, distinct varieties.—Messrs. J. BURRELL & CO., Howe House Nurseries, Cambridge, won 1st prize in this class from Mr. JNO. MATTOCK, New Headington, Oxford. Messrs. J. BURRELL, who had much greater variety in colour, showed Mrs. Ed. Mawley, Souvenir d'Elise Vardon, Souvenir de Pierre Notting, Boadicea, Muriel Grahame, Catherine Mermet, Souvenir de S. A. Prince, Souvenir d'un Ami, Empress Alex. of Russia, The Bride, Comtesse de Nadailac, and Lady Roberts. In the 2nd prize collection, Medea, Cornelia Koch, Mme. Hoste, and other white and cream-coloured varieties were very pretty and good.

ROSES IN VASES.

There were several classes for Roses cut with long stems, and exhibited in vases, but not so many as we think would be appreciated by visitors.

Fourteen distinct varieties, three Blooms of each.—There were only two exhibits in this class, and the 1st prize was won from Mr. GEO. PRINCE by Messrs. D. PRIOR & SONS. The varieties that had the best effect, staged in this manner, in vases, were Maman Cochet, Mrs. Ed. Mawley, Souvenir de S. A. Prince, Marie Van Houtte, Caroline Kuster, Cleopatra, and The Bride. FIG. 5.—ROSE MRS. JOHN LAING.

Showing the effect of tying out a variety that makes long flexible shoots. The plant, of which only a portion is represented, carried fifty-nine buds and blooms.
(From a photograph by G. E. Low, Dublin.)

PRINCE's best treble consisted of three uncommonly fine blooms of the variety Mrs. Ed. Mawley; Medea was very good in colour, as was Bridesmaid; Madame Hoste and Muriel Grahame also were of commendable quality.

Twelve distinct varieties.—In the collections of twelve blooms, only varieties mentioned in the National Rose Society's Catalogue of Exhibition Roses were permitted, and not more than six varieties of Teas or Noisettes. Seven blooms were shown of each variety, and they were arranged equally around the vases, so that they faced each direction. There were four very good exhibits, and the finest was one from Mr. GEORGE MOUNT, who had good blooms upon thick stems, bearing healthy well-developed foliage as well as flowers. His varieties were Ulrich Brunner, Liberty, Mrs. W. J. Grant, Mrs. Sharman Crawford, Clio, General Jacqueminot, Mrs. Jno. Laing, Caroline Testout, Madame Luizet, Margaret Dickson, Marquise Litta, and another. The 2nd prize was won by Mr. GEORGE PRINCE, his best blooms being Bessie Brown, Anna Olivier, Marquise Litta, and Mrs. W. J. Grant; 3rd, Messrs. R. HARKNESS & Co., Hitchin, Herts.

Nine distinct varieties of Teas and Noisettes, exhibition varieties.—Mr. GEO. PRINCE was unchallenged in this class, and staged nine fine bouquets of seven blooms each, in vases, upon a black velvet ground cover, that usually accompanies the Longworth exhibits. His centrepiece was a bouquet of Mrs. Ed. Mawley, and the best remaining ones were Madame Hoste, Rubens, Medea, and Hon. Edith Gifford.

GARDEN ROSES.

The glorious "garden" Roses, as they are termed, which include all those varieties that excel in free-flowering qualities, and are therefore more decorative in the gardens, though less perfect when cut as single specimens, than the exhibition varieties, were shown in capital condition. Several are figured in our illustrations this week.

Thirty six distinct varieties, not fewer than three trusses of each.—In this exacting class, Messrs. PAUL & SON, the Old Nurseries, Cheshunt, Herts, won 1st prize in this class, and exhibited a collection of excellent quality, and gorgeous effect. We can only mention a few of the most effective varieties, which included Uoa, a beautiful single white hybrid Briar, more than 3 inches across; Madame A. Chatenay, Camoens, Madame Pernet Ducher, Dawn (beautiful), Marquise de Salisbury, R. macrantha, W. Allen Richardson, Prolific, a pink-coloured Moss Rose; Boule de Neige, Purple East, rambler; Reine Olga de Wurtemberg, one of the very best; Madame Jules Grolez, and Liberty. The 2nd prize collection was one from Messrs. FRANK CANT & Co. In this stand the semi-double crimson flowers of Fabier had an uncommon effect; Liberty and Killaruey, Lady Battersea and Gustave Regis, Irish Glory and Soubrette Messiny,

were all capital. Messrs. GEORGE COOLING & SONS, of Bath, were 3rd.

Eighteen distinct varieties.—Mr. GEO. PRINCE, of Longworth, won 1st prize for eighteen bunches, and had a grand exhibit. His varieties included Madame F. Resal, Madame A. Carrère, Bellefleur, a new H. P. Rose, having nearly single flowers, of rich rosy red colour, 4 inches across; Thalia, Jacot's Pride, a pink hybrid Sweet Briar; Madame Chedanne (yellow), Papiillon, Purity, Claire Jacquier the new Rambler Queen Alexandra, Leuchstern, Hebe's Lip, W. A. Richardson, Marquis of Salisbury, and R. Moschata alba; 2nd, Mr. CHAS. TURNER; and 3rd, Messrs. G. COOLING & SONS.

Eighteen Distinct Varieties of Summer-flowering Roses (H.P.'s, H.T.'s, T.'s, and Chinas not admissible).—These Roses made a very pretty display indeed. Messrs. F. CANT & Co. won 1st prize with the following varieties:—Maiden's Blush, Rubens, Mme. Plantier, Red Provence, The Lion, Persian Yellow, Rosa Mundi, Lucida Plena, Myrianthes, Dundee Rambler, Inermis, Wall-flower (most showy), Tuscany, Claire Jacquier, Hebe's

Lip, Leuchstern, The Garland, and Red Damask. 2nd Messrs. PAUL & SON, Cheshunt.

Each exhibit of garden Roses was arranged on a separate table, so that the visitors could walk all round each—a very appreciable improvement upon the conditions on a former occasion.

ROSES IN POTS.

There was a class for Roses in pots, but the result was poor, there being but one exhibit. Mr. C. TURNER, of Slough, however, staged a collection, and was awarded 1st prize.

MEDAL ROSES.

The Society's Gold Medals for premier blooms shown by nurserymen were awarded as follows. For the best H.T. Rose, Bessie Brown, shown by Messrs. D. PRIOR & SON, in his exhibit of seventy-two Roses; the best H.P., Mrs. John Laing, exhibited also by Messrs. D. PRIOR & SON; and the best T., Mrs. Edward Mawley, exhibited by Mr. PRINCE.

OPEN CLASSES.

Twelve Hybrid Teas, distinct.—1st, Messrs. D. PRIOR & SON, Colchester, with Mildred Grant, Robert Scott, Bessie Brown, good in general this year; Lady Mary Fitzwilliam and Countess of Caledon were the best developed flowers. 2nd, A. DICKSON & SONS, Ltd. The flowers of Mildred Grant, Alice Lindsell, Lady Clanmorris were very much finer than the rest of the box; 3rd, Messrs. FRANK CANT, Braiswick, Colchester. The examples of Caroline Testout and Mildred Grant were good.

Twelve Blooms of any White or Yellow Rose.—1st, Messrs. ALEXANDER DICKSON & SONS, Ltd., with Bessie Brown, a lot of flowers in the greatest perfection; 2nd, Mr. JOHN MATTOCK, New Headington, Oxford, with Medea, a variety seldom met with in other collections this year. There were three competitors.

Twelve Blooms of any other Rose than white or yellow.—1st, Messrs. ALEX. DICKSON, with blooms of Mrs. W. J. Grant, very fresh and bright-looking, growth and foliage vigorous; 2nd, Mr. CHAS. TURNER, Royal Nurseries, Slough, with that fine variety Mrs. John Laing; Mr. GEO. MOUNT, Canterbury, and Messrs. D. PRIOR & SON, Colchester, were equal 3rds. There were ten exhibits in this class.

Nine Blooms, distinct.—1st, Messrs. A. DICKSON & SONS, Ltd., with very fine blooms of Mildred Grant, and there was a remarkable absence of weak blooms in the exhibit; 2nd, Messrs. G. BUNYARD & Co., Royal Nurseries, Maidstone, with generally very fine blooms of Frau Karl Druschki and Robert Scott, the latter a very full light pink flower, outer petals of which reflex; 3rd, Messrs. P. R. CANT, with Frau Karl Druschki. There were three competitors.

NEW ROSES.

Twelve Blooms of new Roses.—1st, Messrs. B. R. CANT & SONS, The Old Rose Gardeas, Colchester. Nice flowers

FIG. C.—THE ROSE ARCADE AT CLAVERTON MANOR, NEAR BATH.

of Alice Lindsell, of a blush tint and pretty form; Pele von Godesberg, creamy white, petals apparently too few to make a fine flower; William Askew, bright pink, a globular bloom fairly full, with a shell petal; Frau Peter Lambert, flower pink with a yellowish tint, and outer petals which reflex; Mildred Grant, very pale blush; Robert Scott, a shell-petalled, pale pink bloom; other varieties were not at their best. 2nd, Messrs. F. CANT & CO., Braiswick, Colchester, whose best flowers were Alice Lindsell, Boadicea, Edith D'Ombraun, Mildred Grant, Souvenir de Jean Ketten. Equal 3rds were granted to Messrs. A. DICKSON & SONS, Royal Irish Nurseries, Newtownards; and to Messrs. PAUL & SONS, Cheshunt. There were four competitors.

New Seedling Roses, or Distinct Sports.—Card of Commendation was awarded to a seedling named Mrs. Orpen, won by O. G. ORPEN, Esq., Colchester, a very large single-flowered variety, with broad petals of a light pink hue; to climbing Rose Maharajah, a deep velvety crimson single-flowered variety, shown by Messrs. B. R. CANT & SONS; and to a climbing Polyantha Rose Blush Rambler, shown by the same exhibitors as the last-named; it is a profuse bloomer, the flowers coming in terminal trusses; and to Rosa polyantha Madame Lavasseur, shown by Mr. W. J. WOODS, Swatheling. Exhibits in this class were few.

DECORATIVE CLASSES.

Three Sprays of Roses.—No 1st prize was awarded, but Mr. GEO. MOUNT, Canterbury, was placed 2nd, with compactly formed sprays of white, crimson, and pink-coloured varieties, rather stiff and inelegant; 3rd, Miss JESSIE P. LAUGHTON, Raymead, Hendon, the sprays consisting of Alice Brunner, Souvenir de Catherine Guillot, &c. Four persons competed.

Twelve varieties of Single-flowered Roses.—1st, Messrs. G. COOLING & SONS, Bath, with large bunches, set up with plenty of Rose foliage. We noted the yellow Austrian Brier, The Lion, Leuchtstern, single white rugosa moschata alba, and Irish Glory, a flower of a rosy-crimson hue, &c. 2nd, Messrs. PAUL & SON, Cheshunt, Herts; the display consisted of massive bunches of leafy shoots and blossoms, including R. rugosa alba, Brenda, a bright pink flower; The Lion, a purplish-erimson; R. rugosa, Paul's large flowered; Andersoni, with crumpled petal, pink Carmine Pillar, &c.

Nine distinct varieties of Button hole Roses.—1st, Mr. G. PRINCE, Longworth, Berks, whose exhibit consisted of bunches of about eight blooms in the bud state, of the varieties Innocente Pirola, Marie Van Houtte, Papillon (pink), Ma Capucine, Souvenir de S. A. Prince (one of the choicest vars. for a button-hole), Souvenir de J. B. Guillot (crimson), very bright and nice; Madame Percy, a pretty yellow filbert-shaped bud. Mr. JOHN MATTOCK, was 2nd, and among his varieties were nice blooms of Jas. Watt, a blush-white; Souvenir Catherine Guillot, Cecile Brunner, a small flower more useful in the open state than as a bud; Papa Gontier, a crimson filbert-shaped bud, and Mme. Falcoet. There were only two exhibits in this class.

An Arch of Roses.—1st, Messrs. PAUL & SON, Cheshunt, one-half of the arch being covered with Tea Rambler, semi-double pink-flowered variety, and Hélène, similar in form, but of a lighter shade of pink. The display was formed of long shoots bearing flowers placed in vessels of water; 2nd, Mr. G. PRINCE, with climbing white Pet and Queen Alexandra; 3rd, Mr. J. MATTOCK.

AMATEUR SECTION.

CHAMPION TROPHY CLASS.

Thirty-six blooms, distinct varieties.—1st prize, E. B. LINDSELL, Esq., Hitchin, Herts, whose best blooms were Mrs. Grant, Muriel Grahame, splendid; Lady M. Fitzwilliam, White Lady, a grand flower; Marquise Litta, A. K. Williams, Mildred Grant, Prince Arthur, Alfred Colomb, Ulster, Horace Vernet, Dr. Sewell, F. Michelon, Duchess of Portland, and Madame Gabrielle Luizet, a really fine array of good flowers. 2nd, O. G. ORPEN, Esq., Colchester, whose finest blooms were, Antoine Rivoire, Mildred Grant, Souvenir de S. A. Prince, Maman Cochet, Bessie Brown, Catherine Mermet, Cleopatra, Ernest Metz, Lady Mary Fitzwilliam, and Ulrich Brunner. 3rd, CONWAY JONES, Esq., Hucclecote, Gloucester. There were five entries in this important class, and the standard of quality for the season was high.

For twenty-four varieties, 1st, ALFRED TATE, Esq., Leatherhead, Surrey, who showed Comtesse de Naillac, Mrs. Grant, Horace Vernet, Marquise Litta, and Mrs. Ed. Mawley, in very fine condition; 2nd, THOS. B. GABRIEL, Esq., Woking, whose Souvenir d'Elise Vardon, Mrs. Grant, Golden Gate, General Jacqueminot, and Mrs. J. Laing, were the best; 3rd,

equal prize for ALEXANDER HILL GRAY, Esq., and E. M. EVERSFIELD, Esq.

Twelve distinct varieties, three blooms of each.—1st, E. B. LINDSELL, Esq., Hitchin, who had Mrs. Grant in superb form, and very fine Anna Olivier, Marquise Litta, and Mrs. Sherman Crawford; 2nd, C. B. HAYWOOD, Esq., Reigate, whose Caroline Testout, Margaret Dickson, Gustave Piganneau, and Madame G. Luizet, were the best; 3rd, CONWAY JONES, Esq., Gloucester. There were four entries.

Nine Blooms of any Rose excepting Tea or Noisette.—1st, Rev. J. H. PEMBERTON, Havering-atte-Bower, Essex, with Caroline Testout, in fine form; 2nd, C. B. HAYWOOD, Esq., Reigate, with Mrs. J. Laing.

Twenty-four Blooms, distinct.—1st, R. G. WEST, Esq., Reigate, with excellent Madame Hoste, La France, Mrs. J. Laing; 2nd, W. C. ROMAINE, Esq.; 3rd, E. M. EVERSFIELD, Esq., Horsham, Sussex.

Eight distinct varieties, three Blooms of each.—E. M. EVERSFIELD, Esq., Horsham, was 1st, with finely coloured Ulrich Brunner, Madame G. Luizet, Captain Hayward, and Kaiserin August'a Victoria; 2nd, W. C. ROMAINE, Esq., Old Windsor, with good specimens of Madame Gabrielle Luizet and Medea; 3rd, C. W. E. DUNCOMBE, Esq., Ware, Herts.

Seven Blooms of one variety.—W. C. ROMAINE, Esq., Old Windsor, was 1st, with Mrs. Grant; 2nd, E. M. EVERSFIELD, Esq.; 3rd, Rev. H. A. BERNERS, Ipswich.

Twelve distinct varieties.—1st, THOS. B. GABRIEL, Esq., Woking, who had fine blooms of General Jacqueminot, La France, Bessie Brown, very fine; Captain Hayward, and La Harve; 2nd, G. MOULES, Esq., Hitchin, Herts, with Frau Karl Druschki, Marchioness of Downshire, and Marquise Litta; 3rd, ERNEST WILKINS, Esq., Sidcup, whose La Fraicheur and La France were capital blooms. There were nearly a dozen competitors.

Three Blooms of any variety, excluding Teas and Noisettes.—1st, G. H. BAXTER, Esq., Brentwood, with Marquise Litta; 2nd, J. R. CURTIS, Esq., Colchester, with Mrs. J. Laing; and 3rd, E. WILKINS, Esq., Sidcup.

Nine Blooms, distinct.—1st, COURTNEY PAOE, Esq., Enfield, whose Mrs. Grant, Caroline Testout, Frau Karl Druschki, and Bessie Brown, were all good; 2nd, J. D. THOMPSON, Esq.; and 3rd, Mrs. E. A. MOULDON, Stevenage. There were ten competitors.

Six Blooms, distinct.—1st, Dr. J. E. PALLETT, Earl's Colne, Essex; his Madame Hoste, Souvenir de S. A. Prince, Mrs. Grant, and Bessie Brown were good. 2nd, A. C. TURNER, Esq., Edgware, with Bessie Brown in perfection. There were eleven competitors.

Five Blooms of any one variety excepting Teas or Noisettes.—1st, R. W. BOWYER, Esq., Hertford, with Mrs. Grant; 2nd, Rev. F. J. FULFORD.

Six Blooms, distinct varieties.—1st, Miss ALICE A. LUCAS; and 2nd, Dr. E. MALTBY.

Twelve Blooms, distinct varieties.—1st, Mrs. L. E. INNES, Hitchin Herts, with Bessie Brown, Caroline Testout, and Mrs. J. Laing as the best. 2nd, G. MOULES, Esq., Hitchin, with Prince Arthur, Elise Vardon, and La France among his leading flowers. A Challenge Cup goes with the 1st prize in this class.

Four Distinct Varieties, Three Blooms of each.—1st W. KINGSTON, Esq., Bedford, with excellent Caroline Testout, Medea, and Marquise Litta; 2nd, E. WILKINS, Esq., Sidcup, with finely coloured Marquise Litta, and good Mrs. Laing; 3rd, G. H. BAXTER, Esq.

Twelve distinct varieties, the competition open to all Amateurs who have not twice previously won the Ramsay Cup.—1st, A. TATE, Esq., Leatherhead, with fine blooms of Bessie Brown, Souvenir de Mme. E. Verdier, very fine; Mme. Cusin, Dr. Sewell, White Maman Cochet and Mrs. Mawley, a very nice bloom. Muriel Grahame, a grand flower, was awarded the Silver Medal; Kaiserin A. Victoria, Gustave Piganneau, and Ulrich Brunner, this was a box of good blooms; 2nd, A. HILL GRAY, Esq., Bath; and 3rd, Rev. J. H. PEMBERTON.

Six Blooms, open to those who have not won a prize at any show of the National Rose Society.—1st, Dr. PALLETT, with Souvenir de Président Carnot and Ulster; 2nd, E. PERCY SUGDEN.

Six Blooms distinct, open to Amateurs who have joined the Society since the last Metropolitan exhibition.—1st, H. J. HARTON, Esq., Heytesbury, Wilts, with small but nicely formed flowers of Mrs. Grant and President Carnot; 2nd, Mr. E. M. WIGHTMAN.

ROSES GROWN WITHIN EIGHT MILES OF CHARING CROSS.

First prize, J. H. THOMPSON, with a good Charles Lefebvre; 2nd, Mr. ADCOCK.

Six Blooms of New Roses distinct.—In this class no 1st prize was awarded; 2nd, Rev. J. H. PEMBERTON, with good blooms of Frau Earl Druschki and Mildred Grant.

TEA AND NOISETTE SECTION TROPHY CLASS.

Eighteen Blooms distinct.—1st, ALEXANDER HILL GRAY, Esq., Bath, with a box of good blooms, the best being Mme Hoste, Mme. Cusin, Princess of Wales, Souvenir de Elise Vardon, Bridesmaid [the Premier Tea, the winner of the Silver Medal]; Maman Cochet, white Maman Cochet, The Bride, and Mrs. Ed. Mawley, were all good; 2nd, Rev. F. R. BURNSIDE, Essex, whose Cleopatra, Mrs. Ed. Mawley, Sylph, and Muriel Grahame, were all in fine form.

Eighteen Blooms distinct.—1st, Rev. F. R. BURNSIDE, a pretty bloom of Cleopatra being in his lot.

Eight distinct varieties, three Blooms of each.—1st, A. HILL GRAY, Esq., Bath, his Madame Cusin, Catherine Mermet, Mrs. Ed. Mawley, and The Bride, being all good flowers; 2nd, Rev. F. R. BURNSIDE, with good Innocente Pirola, Maman Cochet, and Medea as among his best.

OPEN TO GROWERS OF FEWER THAN 200 PLANTS.

Nine Blooms distinct.—1st, G. H. BAXTER, Brentwood, with Innocente Pirola and Cleopatra, as the best; 2nd, A. MUNT, Esq., Slough.

Six Blooms distinct.—1st, W. R. HAMMOND, Esq., Burgess Hill, his Ernest Metz and White Cochet being fine blooms.

Five Blooms of any one variety to be shown in a Vase.—1st, G. H. BAXTER, Brentwood, with Medea in good form; 2nd, Rev. F. J. FULFORD, with the same variety.

Four distinct varieties, three Blooms of each.—1st, A. SLAUGHTER, Esq., Steyning, Muriel Grahame and Maman Cochet being the best; 2nd, Rev. F. J. FULFORD, Gloucester.

OPEN TO AMATEURS WHO HAVE NEVER WON A PRIZE AT NATIONAL ROSE SOCIETY'S EXHIBITIONS.

Six Blooms.—1st, H. CLINTON BAKER, Esq., Brayford-bury, Hertford, Madame Hoste and Cleopatra being his finest flowers.

EXHIBITION ROSES IN VASES.

Six varieties, seven Blooms of each.—A. HILL GRAY, Esq., Bath, was the only exhibitor, his Anna Olivier being very good; Madame Hoste was also fine.

Five distinct varieties in vases.—1st, BEATRICE H. LANGDON, Rubens being a good vase.

DECORATIVE SECTION—LADIES.

A Bowl of Roses.—1st, Miss JESSIE LANGDON, Hendon, with a fine arrangement of single varieties set up most artistically. There were nine exhibitors in this class.

Vase of Cut Roses.—1st, E. MAWLEY, Esq., Berkhamsted, with a showy vase of Mrs. Grant, cut with ample stems, and arranged with ample foliage.

GARDEN ROSES.

Eighteen distinct varieties, three trusses of each.—1st A. TATE, Esq., Leatherhead, with Irish Glory, reddish-scarlet; Gustave Regis, Paul's Carmine Pillar, Macrantha, Lady Battersea, Leonie Lamesch, Rosa Mundl, &c.; 2nd, Rev. J. H. PEMBERTON, with Gustave Regis, Madame Alf. Carrière, blush-white; grandiflora, Lady Curzon, and alba rosa, very fine.

Twelve distinct varieties, in not less than three trusses of each.—Mrs. F. PERKINS, Holmwood, Surrey, was 1st having Cooling's Yellow, W. A. Richardson, Purity, Macrantha, and the yellow Madame C. Guinousseau; 2nd, Rev. F. J. FULFORD.

Six distinct varieties in not fewer than three trusses of each.—1st, A. C. TURNER, Esq., Edgware, Madame Pernet Ducher and L'Innocente, being very fine vases; 2nd, Mr. ED. MAWLEY, whose macrantha was very fine.

Six Vases of Sweet Briar Roses in six distinct varieties.—1st, Mrs. HORNE, Reigate, Amy Robsart, Rose Bradwardine, and Anne of Gierstein, with Brenda Pink, being the best. 2nd, G. H. BAXTER.

Six distinct Button hole Roses.—1st, O. G. ORPEN, Esq., with Madame Ravary, Ma Capucine, Madame Hoste, and Anna Olivier. 2nd, A. C. TURNER, Edgware.

Five distinct varieties of Garden Roses.—1st, O. G. ORPEN, Esq., Colchester, with Wichuriana, Gardénia, Lady Curzon, Himalayan Briar, and Purity, which were very beautiful. 2nd, Rev. J. H. PEMBERTON, whose multiflora simplex was very pretty.

MEDAL ROSES.

The Premier T., H.T., and H.P. blooms, for which medals were awarded in the Amateurs' classes, were as follows:—Bridesmaid, exhibited by ALEXANDER HILL GRAY, Esq.; Muriel Grahame, exhibited by A. TATF. Esq.; and Ulrich Brunner, exhibited by Mrs. L. E. INNES, Hitchin, Herts.

In Class 61, for a dinner-table decoration, Mrs. O. G. ORPEN, Colchester, was awarded 1st prize for a table

beautifully adorned with single and semi-double Roses. The sorts used were Jersey Beauty, Lady Sarah Wilson, and another. These in a large central bowl made a very effective arrangement. Buds and fully-expanded blossoms were freely employed for the centre, and but little foliage. Mrs. HOLLAND, Grange Road, Sutton, Surrey, was 2nd.

NON-COMPETITIVE EXHIBITS.

There were several non-competitive exhibits, amongst which may be mentioned those following:—Messrs. Geo. Bunyard & Co., Maidstone, Roses; Mr. GEORGE MOUNT, Roses; Messrs. Dobbies, Ltd., Dereham, Roses; Messrs. G. Jackman & Sons, Woking, Messrs. W. Cutbush & Sons, Highgate, Carnations, Lantanas, &c.; Messrs. H. Cannell & Sons, Swanley, 100 plants of Cannas, in pots; Messrs. W. Spooner & Sons, Hounslow, Roses; Messrs. Dobbie & Co., Orpington and Rothesay, Pansies and Violas; Messrs. Wallace & Co., Kilnfield Gardens, Colchester, hardy flowers; Messrs. J. Green & Nephew, 107, Queen Victoria Street, Munstead flower glasses; Frank Richard Curtis, Esq., Morden Grange, Wokingford, Colchester, Roses; and Mr. R. Pinches, "Acme" labels and arches for Roses, &c.

ROYAL HORTICULTURAL: EXHIBITION AT HOLLAND HOUSE.

 Mr. George, Putney, for Sundries.
 Messrs. Dowell for Pottery, &c.
 Messrs. Herbert for Sundries.
 Mr. Pinches for Labels.
 The Standard Co. for Pruners, &c.
 Messrs. Ohlendorf for Manures.

GLOUCESTER AND CHELTENHAM ROYAL HORTICULTURAL.

JUNE 24.—This Society held a very successful show on the above date in the Montpellier Gardens, Cheltenham, the chief features of which were the groups of miscellaneous plants, the Orchids, and some other special subjects for which the schedule provides several classes. The table decorations and bouquets were also of great merit, but fruit and vegetables were sparsely shown, and the quality, as might be expected this season, was not very good. The arrangements were in every respect well carried out, and great credit is due to the joint hon. secretaries, Messrs. Sharp and Shenton, and their committee.

Groups of Orchids in a space of 100 square feet.—Of two competitors in this class, Mr. CYPHER, Exotic Nurseries, Cheltenham, was deservedly placed 1st for a splendid lot of well-grown plants of choice species and varieties of Cattleyas, Odontoglossums, Masdevallias, Oncidiums, Epidendrums, &c. The flowering plants were intermixed with Ferns. Mr. VAUSE, of Leamington, was the other exhibitor.

Miscellaneous Plants in 150 square feet (open).—Here Mr. CYPHER was again 1st among four exhibitors, and arranged a valuable collection of plants, amongst which Orchids in variety, Lilies, Heaths, and Verbena Miss Wilmott took important places with Palms, Crotons, Caladiums, Ferns, &c., as ornamental foliage plants. Mr. VAUSE again followed with a good assortment of plants; and Messrs. PATES & SHARP, The Nurseries, Cheltenham, were a good 3rd.

A similar class, devoted to amateurs, brought Mr. Mutlow, gr. to Major PERCY SHEWELL, to the front with a very creditable exhibit; Mr. Maddock, gr. to J. HORLICK, Esq., Cowley Manor, being placed 2nd; and Mr. May, gr. to H. O. LORR, Esq., 3rd.

Pelargoniums.—Classes were provided both for show and zonal varieties of these, and, arranged in groups, they made brilliant displays. With show varieties, Mr. MAY took the premier award, closely followed in the order named by Messrs. PATES & SHARP, and Mr. Mutlow, gr. to Major P. SHEWELL; and with zonals, Mr. MUTLOW was placed 1st; Mr. MAY and Messrs. PATES & SHARP being respectively 2nd and 3rd.

Gloxinias were splendidly shown in groups, Mr. MAY being 1st with superior varieties, and Mr. MUTLOW 2nd. Carnations were also well staged, Messrs. HEATH & SON, The Nurseries, Cheltenham, who gained 1st honours, having especially a fine group of the leading varieties; Mr. MAY was placed 2nd.

Messrs. HEATH & SON were also 1st for a group of tuberous-rooted Begonias, and staged a fine assortment of double and single-flowered varieties; Messrs. PATES & SHARP, who were 2nd, had also a splendid group, comprising excellent varieties.

Plants.—Ten stove and greenhouse plants in flower brought Mr. CYPHER once more to the front with well-grown and flowered large plants of *Ixora salicifolia*, *I. Williamsi*, *Allamanda nobilis*, *Bougainvillea Cypheri*, *B. Sanderi*, *Statice profusa*, a *Stephanotis*, and *Azalea Holfordi*, in splendid condition. Mr. VAUSE was placed 2nd.

Table plants were well staged by Mr. MUTLOW, Mr. MADDOCK, and Messrs. PATES & SHARP, who took honours in the order named.

Twelve flowering plants in 6-inch pots made an excellent class, Mr. MUTLOW being placed 1st, with well-flowered small plants, including *Ericas*, *Cattleyas*, &c.; Mr. MADDOCK was a close 2nd, and Mr. MAY, 3rd.

Mr. MAY was a good 1st with six pots of Lilliums, followed by Messrs. PATES & SHARP.

Cut Flowers, Roses, with their foliage, arranged in a space of 6 ft. by 4 ft.—Here Messrs. TOWNSEND & SON, Worcester, were 1st with a good display, consisting of upwards of fifty varieties; Messrs. PATES & SHARP being 2nd with a fewer number of equally good kinds.

Twenty-four Blooms, Roses.—Here Messrs. TOWNSEND & SON were again 1st with a good box, containing Jeannie Dickson, Margaret Dickson, The Bride, Grace Darling, Abel Carrière, Caroline Testcut, and Reine Marie Henriette, &c.

Herbaceous and Perennial Cut Flowers, in a space 6 ft. by 3 ft., brought two exhibitors, who staged almost equal productions; but Messrs. PATES & SHARP, having the best arranged collection here, beat Mr. CYPHER, who was placed 2nd.

Messrs. PATES & SHARP were again deservedly placed 1st with cut flowers and foliage, arranged in a space of 6 ft. by 4 ft., having such choice subjects as Roses, Carnations, Sweet Peas, &c., well arranged. Mr. VAUSE was 2nd with a capital assortment of flowers.

Table Decorations and Bouquets were prettily arranged Miss WATSON being 1st in the table decorations, and Messrs. PATES & SHARP with a bouquet.

Mr. WHITE, Worcester, staged a fine collection of herbaceous and perennial flowers; and Mr. CYPHER a large group of Pelargoniums, not for competition.

BRISTOL & DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

JUNE 25.—This Association held its usual meeting at St. John's Rooms on the above date, Mr. E. POOLE, F.R.H.S., presiding. The evening was set apart for the reading of "Horticultural Clippings," prizes being offered for the most interesting. Twelve of the members competed for the prizes, which were awarded to Messrs. Curtis, Kitley, and Hancock.

RICHMOND HORTICULTURAL.

JULY 1.—The annual exhibition of this Society was held in the Old Deer Park on Wednesday last. Amongst the non-competitive exhibits were the following. From J. P. MORGAN, Esq., Dover House, Rochampton (gr. Mr. J. F. McLeod), a collection of cut flowers of Souvenir de la Malmaison and other varieties of Carnations (Gold Medal). Sir FRED. WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), an excellent group of Orchids. The exhibit included plants of *Cypripedium callosum* Sanderæ, *C. Veitchianum*, *C. Rothschildianum*, *Odontoglossum crispum*, and *O. hastilabium* (with forty flowers); *O. cordatum*, *Cattleya Mossii* "Our Queen," *C. M. gigantea*, *C. M. The Queen*, a beautiful variety; *Lello-Cattleya Canhamiana*, *L.-C. Lady Wigan*, *L.-C. Iogrami*, *Sobralia Wiganæ*, *Thunia Veitchiana*, *Sobralia Sanderæ*, and many other fine varieties (Gold Medal).

Mr. J. RUSSELL, Richmond Nurseries, a group of ornamental stove and greenhouse plants (Gold Medal), and a group of Tree Ivies (Gold Medal); Messrs. WARM, Ltd., Feltham, pot. Roses and cut flowers (Silver Medal); Mr. J. BRUCKHAUS, Twickenham, group of Palms; Mr. W. ICTON, Putney, group of Palms and Lilies (Silver Medal); Messrs. J. PEED & SONS, West Norwood, London, Carnations (Silver Medal); Messrs. W. FROMOW & SONS, Chiswick, Japanese Maples (Silver Medal).

The competitive classes were well filled on the whole, and the display was as good as any that have been made for several years past.

LINNEAN.

GERMINATION OF DAVIDIA.

At a recent meeting of the Linnean Society, Mr. C. H. WRIGHT read a short paper by Mr. W. BOTTING HEMSELEY on the "Germination of the Seeds of *Davidia involucrata*." The fruit has an exceedingly hard, bony endocarp, or "stone," enclosing usually a number of seeds, and one wonders at first how they will free themselves for germination. A gardener obtaining the fruit for the first time with a view to propagation, would probably try to extract the seeds to accelerate germination; but he would find this a difficult task. On committing the fruits to the earth, however, he would soon discover an admirable natural provision for freeing the seeds so far that germination can proceed. Under the influence of moisture, a portion of the back of each cell (carpel) separates and falls away in the form of a valve or shutter, revealing a portion of the seed. The radicle soon begins to grow, and in due time reaches the ground, when the upper part of the plantlet frees itself from the fruit, and commences an independent existence.

FIG. 7.—AMERICAN GOOSEBERRY MILDEW (*SPHEROTHECA MORS-UVÆ*).

Lonicera flexuosa variegata, *Bignonia radicans*, *Passiflora corulea*, *Rubus coronarius*, *Jasminum revolutum*, *Clematis calycina* in variety, and any of the hybrids.

FLY ON CUCUMBER PLANTS: W. J. W. It is probable that one or two vaporisations with XL All would effect a cure, few insects being proof against this insecticide. We know of no species of "Cucumber fly" so called, and it would have been advisable to have sent a few specimens for our inspection.

GOOSEBERRIES DISEASED: A. F. G. The fruits are infested with the American mildew of the Gooseberry, a fungus which was described and figured in these pages, Aug. 25, 1900 (see also fig. 7). The fungus can be kept in check by a solution of liver-of-sulphur $\frac{1}{2}$ -oz., water 1 gall. Spray at intervals of ten to fifteen days. Diseased leaves and fruits should be collected and burned.

4, *Helianthemum*; 5, *Hesperis matronalis* G. *Acer Negundo*. The Potatoes have this disease. It is not too late to spray with the Bordeaux Mixture, if you wish to save a large portion of the crop.—J. H. B. *Ranunculus aquatilis*.—F. J. Barnet. 1, *Cypripedium Victoria* Mariæ; 2, *Bryophyllum calycinum*; 3, *Cattleya Gaskelliana*.—J. H. W., Geneva. *Gongora quinquevneris*.—E. W. D. *Catasetum viridi-flavum*, and a form of *Oncidium varicosum*.—F. J. T. 1, *Codiaeum Evansianum*; 2, *C. trilobum*; 3, *C. maculatum*; 4, *C. princeps*; 5, *C. Johannis*; 6, *C. chrysophyllum*.—J. B. See last week's issue; 5, *Galium purpureum*; 6, *Astragalus Sieversianus*.

PEACH-BLISTER AND ORANGE-RUST OF ROSES: *Glasheen*. The Peach leaves and point of shoots are infested by the fungus *Exoascus deformans*, for a remedy for which see recent issues of the *Gardeners' Chronicle*. The Orange-rust of Roses was treated of in our issue for June 27 last. We fear you read your *Gardeners' Chronicle* inattentively. It will not spread to your Apple trees. To the Peach borders apply potash, finely-broken lime-rubble, and decayed stable-dung, the last only if the trees lack vigour. Caustic soda washes, and also petroleum washes, a wine-glassful to 3 gallons of soapsuds, or two dressings of Gishurst Compound Soap, at the rate of 3 oz. to 1 gallon of water, will do good. If there are many suckers, lay bare the upper roots and cut away closely these troublesome growths from the Plum stock. But should the trees be aged or in a very bad condition, it might be prudent to replant the south walls with young trees. If the walls are very extensive, plant part with Pear trees of late-ripening varieties. Most early varieties get soon mealy on such walls. We cannot say how long it might take to reclaim the trees, not having seen them—probably two years.

PEACHES FALLING: C. W. H. The fruits are attacked by mildew. Pull every affected fruit and burn it, and syringe the tree several times with a mixture of liver-of-sulphur, $\frac{1}{2}$ oz., in 1 gallon of water.

POTATO-HAULM: A. L. S. Affected with the Potato-disease. You may still do good by spraying with Bordeaux Mixture.

SWEET PEAS: H. W. The plants have been growing very strongly and have received a check from cold and rain. We find no fungus or insect.

TOMATO DISEASED: W. R. R. We would refer you to an answer under the initials "W. C." in the issue of the *Gardeners' Chronicle* for June 20, 1903, p. 404, for an answer.

VINES: F. J. R. The leaves are affected with the Vine-mildew, and the berries are badly shanked. The general appearance of the berries and leaves is similar to that which usually results from the roots getting into a cold and damp sub-soil.

TRADE NOTICE.

We understand that Mr. E. Scaplehorn, who for the past nine years has been in charge of the Alpine and Hardy Plant Department of Messrs. Jackman & Son, Woking, will shortly take a similar appointment with Messrs. Wm. Cutbush & Son, Highgate, who intend making a special feature of this department.

ENQUIRY

COCKCHAFFERS.—Can any reader give me particulars of an apparatus in which acetylene gas-light, with large reflectors, is used for the capture of these insects? *Scine*.

ANSWERS TO CORRESPONDENTS.

** EDITOR AND PUBLISHER.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the literary department, and all plants to be named, should be directed to the EDITOR. The two departments, publishing and editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are mis-directed.

AQUATIC PLANT: J. H. B. The plant, *Ranunculus aquatilis*, is not readily got rid of, unless you can run off the water for a month or two during the warm weather, and keep the pond dry. If swans be kept on the pond, they would do much in keeping this and certain other weeds in check.

CREEPERS IN AN UNHEATED GLASSHOUSE IN NORTH LANCASHIRE: *Glasheen*. None of the Creepers you name is sufficiently hardy to stand in such a house. You had better try *Roses*, *Maréchal Niel*, *Catherine Mermet*, *W. Allen Richardsou*, white or yellow *Banksian*,

MADRESFIELD COURT GRAPES: C. H. The fruits are attacked by the spot disease, *Glæosporium laticolor*. We know of no cure short of removing every berry in the least degree affected, burning it forthwith. The action of water passing over the bunches and foliage, carries the spores to all parts of a vine. Another year dress the vines with a solution of sulphide of potassium, $\frac{1}{2}$ oz. to 1 gallon of water.

NAMES OF INSECTS: *Young Gardener*. 1, Larvæ of small Ermine-moth, *Hyponomeuter padella*; 2, larvæ of Winter-moth, *Cheimatobia brumata*, and chrysalis of a species of Tortrix-moth; 3, younger stage of 1; 4, brown scale, *Lecanium capræ*, and Tortrix larva; 5, insect gone, probably the larva found with 4.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—A. *Nix, Truro*. *Zephyranthes rosea*.—S. P. *Rhododendron ferrugineum*.—Mrs. L. N. G. *Ophrys apifera*, the Bee orchis.—Lady A. C. 1, *Kalmia latifolia*; 2, *Weigela rosea*; 3, *Kalmia angustifolia*; 4, *Weigela* species. Send better specimen; 5, *Leucothoe axillaris*.—W. W., N. B. *Arisæma Jacquemontii*.—J. C. 1, *Centranthus ruber*; 2, *Thalictrum aquilegifolium*; 3, *Astrantia major*; 4, *Polemonium coruleum*.—A. D. B. *Anthericum (Chrysobactron) Hookeri*.—B. B. *Veronica Teucrium*.—T. B. 1, not found; 2, *Acer platanoides*; 3, *Silene inflata*;

COPPIC AND WOOD PLANTING.

TRAVELLING through rural England, one cannot but observe that there are in most counties large tracts of land producing next to nothing, yet which, from a practical point of view, are fully adapted to grow some kind of timber tree, or, at the least, underwood.

Kent, chiefly on account of its Hop-growing industry, takes the lead as regards plantations of underwood. The chief sorts used for this purpose are Ash, Chestnut, and Birch, with Willow and Alder for marshy or wet woods, and Hazel for those of a hilly conformation, having a chalk or ragstone (greensand) formation below the soil.

Larch and other Conifers are but rarely used, as they do not grow again after being cut down, and so are useless for forming stools, as the root-stocks throwing up many branches (springs) are technically called. The Ash is most generally planted, as it is not particular as to soil or situation; but Hop-growers prefer Chestnut poles, as they are more lasting and heavy. For this reason a Chestnut plantation always realises most at the periodical sales of underwood, as much as £20 an acre being reached in the best districts for Chestnut "cants" near a

hard road, about half that figure for Chestnut and Ash together, and less for falls of a mixed character, where Hornbeam, Beech, and Birch form the staple of the woods.

The application of creosote to the sharpened base of the Hop-poles, technically called "tanking," prolongs the life of the pole to such an extent, that many kinds of wood that under the old system were discarded because they so soon decayed, are now used equally with Chestnut, Ash, Oak, and other durable woods.

This process is generally done by standing the poles, after sharpening the butt ends upright in iron tanks, called dipping-tanks. These are provided with a furnace and flues underneath, with an iron damper in the smoke-shaft. By this means the creosote in the tank is kept gently boiling, and thus the sap is expelled from the cellular tissue and vessels of the wood, and its place occupied by creosote. This enables the Hop-grower to avail himself of all kinds of wood, and, coupled with the lucrative nature of Hop farming, some twenty or more years ago, induced large Hop-growers to buy imported Larch poles. This soon reduced the value of plantation and wood falls, and now these can hardly be said to pay the owner of the land, and certainly cannot return any profit to the tenant-farmer.

These causes are no doubt at the root of the almost universal neglect of woods and coppices now prevailing. It is to be regretted that many are so disregarded that they are rapidly reverting to natural conditions; and were it not that the game-preserving owner must have covert for his pheasants and other game birds, the mischief would be still greater.

In other than Hop-growing districts, woods are merely maintained as covert for game, or even foxes, the underwood being cut every ten years, or more often, and the poles used for fencing and hurdle-making, the top-and-lop for faggots for household use, and the rougher boughs to make bush-harrows, or are used in kilns for burning bricks, and where chalk and ragstone formations form the geological strata of the district, to burn chalk into lime for the use of the builder, or for agricultural uses.

In making a new plantation, the first thing to consider is the choice of a suitable plot of ground, and this is better if it have a moderate slope, so that level fields that are best for agricultural purposes need not be taken. The nature of the soil should then be ascertained, and if it be of a too wet and retentive nature, a few open or pipe drains must be made, the former by preference, as drain-pipes so soon get choked by the roots of growing trees. These must be sunk about 1½ ft. deep, and be few or many, but enough to carry off the superfluous surface-water. They may be dispensed with, however, if Willow, Alder, or even Poplar is selected to form the wood, as these delight in abundance of moisture at the roots, yet neither likes stagnant water.

In making a fresh plantation, the young trees, technically called "plants," are put in on the average 5 to 6 feet apart, usually in straight lines; but should the soil be suitable for Larch, it is economical to plant at least 10 feet apart, and to run a line of this useful Conifer between, as these may be cut down in from seven to ten years after planting, and will

sell freely as poles. As before mentioned, this tree does not grow again after felling, and the roots soon decay, leaving the Ash or Chestnut to grow and make stout trees, which may be cut down as soon as they have attained to one foot in circumference at 3 feet from the base. The felling should be done quite close to the crown, when the resulting breaks from the stock will be from three to five, and these will be drawn up straight by the influence of the surrounding trees, and form useful poles.

In districts near towns, it is always advisable to fence plantations carefully, as the stout clean Ash saplings form a great temptation to loafers and schoolboys. A fence most in character is a live one, and this may be formed of Black Thorn (Sloe), of Quick (White Thorn), or a very good hedge may be made by using the Honey Locust (Gleditschia), as it bears long spines of a tough woody nature, which are persistent, and often 2 inches long, with an opposite pair of thorns at the base, like the hilt of a dagger. This plant grows strongly and rapidly, especially in deep rich soils. Another fact almost unique is the singular habit this genus has of protruding fresh thorns through the bark of the branches, and even of the trunk, when quite large, making it most formidable as a protective fence, both against man and small animals. This hedge will bear close trimming with impunity, and ground game seem to leave it untouched; while even that snake among quadrupeds, the weasel, would find it painfully difficult to make its way through it.

In some counties, it is the custom for the owner of the land to covenant that a certain proportion of timber-trees shall be planted in woods and plantations, the Beech, Elm, and Oak being stipulated where they severally flourish.

When the falls are measured out into cants for sale, the woodrev, acting with the steward, goes through the plantations and marks with a dab of red-lead all that are to remain, and these in time become what is termed blackrinds; and after a still further thinning become timber-trees, and the property of the freeholder, unless there is any clause in the lease providing for the contrary.

It is not customary to till or even to keep down weeds in new plantations, but this is a mistake, as these not only rob the soil, but have a tendency to cramp the free development of the plants. The better plan, therefore, is to dig the intervening space one spit, and to bury all the weeds removing all roots of perennial and biennial weeds, especially those of a climbing habit, as the Black Bryony (Tamus), the Bearbinds, as Calystegia sepium, and the Bind-weed (Convolvulus minor), which not infrequently choke the young sappy "springs" or growths; while such strong weeds as the Thistles, Docks, and the many too vigorous umbel-bearers, will so shade the plants as to draw them up with a sappy and therefore tender growth. This is fatal to the Chestnut, for a severe frost will be certain to kill back the growths to the stool, and so not only hinder its development, but induce a lot of weakly shoots to spring from the base, which will be practically valueless.

There was a time when stiff soils were afforested with Birch and Oak exclusively both being left to make stout trees and then

felled. The bark was removed easily, as the felling was done when the sap was rising, arranged in angular form to facilitate drying, and then sold to the tanner; but this is not done to any extent now, the value of bark being so small that, except in the Oak, it does not pay, indeed the value has gone down quite half. The cause of this is, that the tanner has so many substitutes ready to his hand, as well as chemicals and foreign barks. Among these are Valonia (Acorn-cups) of sorts, Myrobalans from India, Cutch, and Terra japonica, from Singapore and further India; while Australia yields him Mimosa bark, a valuable styptic and tanning material. These, as a rule, are quicker in their action, but at the same time speed is often secured at a sacrifice of durability, and the quality of modern leather is often not so good as that made on the old plan, nor is it so soft and ductile.

These substances are rarely used *per se*, but are mixed in certain proportions with Oak and other barks. In spite of this, the value of bark has rapidly declined, so that it now hardly forms an asset in the valuation of woods and plantations compared with other trees; the Oak, especially *Quercus sessiliflora*, is so slow in growth, and so liable to the attacks of gall-flies of many kinds, that unless in deep clayey and cold soils its use is not recommended.

The employment of Ash and Chestnut has been before cursorily mentioned, and also Willow in variety, and Alder for wet positions. It now remains to say that the Norway Maple (*Acer platanoides*), which I had the pleasure to introduce into Kent as a wood-tree, has proved an undoubted success. Its advantages are that, ground game do not cut it down with their knife-like, rodent teeth, as they too often do the Ash and Chestnut. A wounded and lamed hare will go along a whole line of Ash in the plantation or nursery, and cut down every one a few inches from the ground-line, especially in hard frosty weather, or when snow covers the ground. This cannot be caused by hunger, as the bark is seldom eaten, and it thus appears to be sheer wantonness on the part of puss. It may be, however, simply to keep its teeth in good working order, in the same way as cats claw at the soft bark of certain trees, or a favourite post in a wood fence.

Various means have been advised to prevent this, but the usual practice is to smear the young saplings with some evil-smelling and sticky compound, one of the best and simplest being a mixture of equal parts of Stockholm tar and cart-grease, mixed warm, and applied with a brush to at least 9 inches of the plant from the ground-line. This mixture does not dry, and remains sticky and malodorous for a long time, and neither the hare nor rabbit will venture too near, and risk soiling their whiskers with the "tacky" mixture. The use of gas-tar is dangerous for the same purpose, as it dries quite solid and hard, arresting all growth and expansion of the stem of the plant. Some have advised quassia extract to make the bark bitter; but all such applications are but of a very temporary use, being washed off by the first shower. If you can make sure you have no enemy within your fence, you may use wire-netting, but this should be at least 30 inches high, or hares will jump it.

In order of merit, therefore, I would put the Norway Maple first, particularly in rabbit-infested districts; next to this, the Spanish Chestnut; and thirdly, Ash. Then we have Sycamore, Hornbeam (in the Weald of Kent called Buck-Beech), Birch, and Hazel, for upland coppices, in all cases first associated with Larch. For wet woods, Plum-leaved Willow and Alder; while the Bitter Willow will be found useful in the vicinity of warrens, or where hares abound.

More might be said, but the wish of the writer is merely to call attention to the possibility of utilising much waste land, and this, apart from the idea of simply beautifying estates and the country generally, must be my apology for occupying so much valuable space. *Experience.*

THE BEGINNING OF THE LILY SEASON.

NATURE has of late been very unreliable, so far at least as regards her atmospheric conditions. To-day, after the exercise of much patient assiduity, we have our gardens in almost perfect order, every flower a picture of beauty amid the shadowy twilight created by the trees; to-morrow, to our consternation, it may be everywhere desolated by a fierce south-east wind, accompanied by torrents of rain. Before the untimely presence of such a visitation as we experienced on the confines of July, our fairest flowers, deluged and driven earthwards by the weight of wind and moisture, do not long retain that loveliness of colour and perfection of form which are the gardener's constant joy. But he has this consolation, that the process of floral creation, so mysterious to the profoundest scientific intellect, is still going on; and that the rains which destroy our fully-opened flowers are meanwhile hastening the development of others, which ere long, in happier circumstances, will take their place.

The growth of precious plants has also of late been greatly stimulated by the superabundance of thunder-showers. This has been specially observable in the cases of the Oriental and American Lilies, which seem to rejoice in a season of veritable floods. *Lilium Henryi* and *Lilium monadelphum* var. *Szovitzianum*, for example, have attained a height of not less than 8 feet; the former, which is one of the grandest of Asiatic Lilies, and unquestionably the monarch of the great Martagon family, already expanding its exquisitely beautiful lemon-coloured flowers.

Equally forward in its floral evolution is that loveliest of all Californian Lilies, whose aspect and fragrance are the very essence of refinement, *Lilium Washingtonianum*. It never reaches its adequate stature in this country; nevertheless it generates a considerable number of extremely attractive blooms, white, very delicately spotted with faintest purple; while in a few days it assumes an almost roseate appearance. There is a variety entitled *Washingtonianum rubescens*, in which the tendency I have indicated is, from its first appearance, more strongly marked; but the familiar form is, on the ground of artistic effectiveness, infinitely to be preferred. *Lilium Humboldti* promises to be finer than usual this season; and *Lilium pardalinum*, which for many years I could not induce to grow and flower vigorously, is at last, transplanted manifestly to more congenial soil, a gratifying success. Equally successful, though it has not attained to the same commanding height, is the very similarly coloured *Lilium Burbanki* ×, described by its eminent raiser as a hybrid between the Californian Panther Lily and *Lilium Washingtonianum*. In my own

garden, however, it is almost identical with *Lilium pardalinum*; though Mr. S. Arnott, of Carsethorn, informs me that he has seen a variety of the Burbank Lily with distinctive characteristics. A much finer hybrid is *Lilium excelsum*, which has not proved so enduring or prolific as I could have desired. This Lily is supposed to have been the result of what may be termed natural (as distinguished from cultural or artificial) cross-fertilisation between *Lilium candidum* and *Lilium chalcedonicum*—the luminous scarlet Martagon, and, to a large extent, partakes of the attributes of both—a fact which explains its charming colour and decorative capabilities.

One of the finest specimens of *Lilium auratum*—assuredly the most imposing in dimensions I have ever beheld—obtained last winter from Messrs. Dobbie, of Rothesay, has generated three strongly fasciated stems, undoubtedly the result of hypertrophy. It will probably produce not fewer than 200 miniature flowers, which, as I know from former experience of a similar creation of "high cultivation," will have to be reduced, if the blooms, whose name is legion, are to have any chance of opening with normal facility. Another of my *L. auratum*s came with its head bent so abortively earthwards, as if its neck was hopelessly broken, that it had to be destroyed, as nothing would induce it to grow, like its aspiring Japanese contemporaries, upwards to the light.

Lilium Browni and *Lilium Kramerii* have, in my garden, entirely disappeared, leaving only the memory of their beauty behind; but *Lilium speciosum* and *Lilium chalcedonicum* have grown magnificently; and few Lilies are more radiantly beautiful than these. *David R. Williamson, Wigtonshire.*

THE ROSARY.

NOTES ON ROSES AND ROSE-STOCKS FOR BUDDING.

ALMOST all classes of Rose-stocks, excepting the Manetti, may now be budded; and where possible, unless there is a large number to be done, the operation is best performed on a dull day, or in early morning and late in the evening. If the prevailing weather is very hot, the plants should be afforded water at the root, after loosening the soil, and also after budding.

The standard and dwarf Briars should now be in the best condition for working; the Manetti stocks are best left till August. The wholly longitudinal incision is better than the cross-cut for budding, as the shoots are not so liable to break off from wind or other causes. The surplus shoots of the standard Briars should have been rubbed off last month, and two or three of the strongest left entire near the top. In budding, it is best to use scions from flowering shoots, as they are so much better ripened and take more successfully. In the absence of rain, both stocks and Roses on light, dry soils are the better for a mulch of manure and abundance of water. The multiflora stock is admirable for strong-growing climbers of the Tea and Noisette family, such as M. Niel, W. A. Richardson, Aimée Vibert, and others.

Tea and other Roses on their own roots that were propagated early in the season may now have a shift, if this has not already been done, into 5-inch pots, and be plunged outside on a disused hotbed, but not under glass. They will soon make rapid and abundant growth when assisted by the night dews and the fertilising properties of the manure. To induce a bushy habit, they should be stopped twice during the growing season; the last stopping, if made in August, will afford the plant the opportunity to ripen its wood. Afterwards they can be passed into the cold frame for the winter, giving them all the air possible. *J. D. Godwin.*

ALPINE GARDEN.

IBERIS.

SPRING-FLOWERING kinds of Candytuft are now excellent and various, and need no commendation; their names are somewhat confused and confusing, as many of them are hybrids. *Iberis corifolia* is often praised; this should be spelt *corraefolia*. It is recognised in the *Kew Hand-list* as "of garden origin," and is probably a hybrid. If frequently propagated by cuttings, to prevent leggy plants, it is worthy of a place anywhere; it is then dwarf, with large flower-heads of pure white, lengthening out into long trusses with wide hemispherical ends.

The *Index Kewensis* catalogues a name, *I. corifolia* (Sweet), which I cannot find described. It perhaps took its origin from *I. coridis folio* (Villars, *Plants of Dauphiny*, 1785), referred to in *Bot. Mag.*, tab. 1,785, to *I. saxatilis*. *I. Garrexiana* makes a dwarf and close dark green surface all winter, flourishing well in April and May; it is considered by botanists a variety of *I. sempervirens*, but is widely distinct in many characters from the type.

I. sempervirens has many forms, and probably many hybrids. The type is often more leafy than flowery, and is too tall and spreading for a small rockery. Such dwarf forms as one sold by the name Little Gem are better, and are easily renewed by cuttings, but dwarfs of excellent habit, which cannot be referred with certainty to any species, come spontaneously in gardens where they are encouraged.

The gems of the genus in the Edge garden are two very dwarf forms, referred by botanists to *I. saxatilis*. They are of very slow increase, and make closely crowded, prostrate flower-tufts, each not larger than a sixpence. One kind begins to flower about Christmas, the other about six weeks later, the flowers being uninjured by hard frosts. The untidy and distorted growth in the portrait of *I. saxatilis* (*Bot. Mag.*, tab. 172), gives no idea of the elegant neatness of these two varieties, which I have had for nearly twenty years, but forget their source.

I also recommend two closely allied dwarfs from the south of Italy, *I. Tenoreana* and *I. Pruiti* (*De Candolle, Prodrum.*, vol. i., p. 179). They generally flower only twice with me, flowering themselves to death. The first-named has flowers either white or suffused with rose, the second always pure white. *I. Tenoreana* is figured in *Loddiges' Cabinet*, tab. 1,721; *Bot. Mag.*, tab. 2,783; and *Sweet's Flower Garden*, tab. 88. I do not find any portrait of *I. Pruiti*. The two annually produce a spontaneous crop of seedlings, many of them apparently crossed. If the bushy seedlings are selected, and transplanted to vacant spots on a rockery in autumn, they prove worth the trouble, by flowering in succession all spring and summer.

The prettiest flower of Candytuft now out in my garden bears a large head of clear bright rose colour on a dwarf plant. I suppose it is a hybrid of *I. gibraltarica*, but if it is, I am surprised that it passed unharmed through the destructive frosts of April. *C. Wolley Dod, Edge Hall, Malpas, May 4*. [Reference may be made to Mr. Baker's monograph in the *Gardeners' Chronicle* for 1868, p. 711. Ed.]

purple flowers, I know nothing save that which is to be found in works of reference dealing with Saxifrages. [It is said, in *Index Kewensis*, to be synonymous with *S. prophylla*.] *S. Arnott, Carsethorn* by *Dumfries, N.B.*

SAXIFRAGA COCHLEARIS.

This is one of the most elegant and beautiful of all the June-flowering species, particularly those of the encrusted section. From such species as *S. longifolia* or *S. cotyledon* the cultivator

a rounded rosette more nearly approaching some members of *S. aizoon* rather than those named above. In a rather strong loam, with much grit added, this species grows freely. *E. Jenkins.*

SPARAXIS TRICOLOR IN AN AUSTRALIAN GARDEN.

WHILST in Europe last year I visited upwards of one hundred public and private gardens, parks and recreation grounds in Great Britain, Ireland,

FIG. 8.—SPARAXIS TRICOLOR ON DR. NORTON'S LAWN AT ECCLESBOURNE, SYDNEY, AUSTRALIA.

obtains one very handsome inflorescence in perhaps a 5-inch or 6-inch pot; but it is possible in the same size pot to secure a dozen, or even a score, of spikes of blossom from *S. cochlearis*. These are of snowy whiteness, save for the extremely faint dots of pink on the petals. The plant is not always to be obtained true to name, a very inferior variety between *S. Hostii* and *S. lingulata* sometimes doing service for it. These latter have more or less linear, oblong, or acuminate leaves, while in the true species the much encrusted leaves are distinctly spatulate, forming

France, Germany, Belgium, and Holland, and saw many beautiful examples of landscape gardening and horticultural skill. I noted with pleasure the great advances that had been made in planting bulbs in grass since my previous visit. I saw extensive displays of Snowdrops, Crocuses, wild Hyacinths, various Narcissi, &c., which I thought particularly charming; but for gorgeousness of display I saw nothing to equal the numerous varieties of *Sparaxis tricolor* that the Hon. Dr. James Norton, M.L.C., has growing on his lawn at

SOME RED OR PINK-FLOWERED SAXIFRAGAS.

S. Kolenatiana and others.—A pink-flowered Saxifrage I once cultivated as *Kolenatiana*, now referred by some to *S. cartilaginea* [as in *Index Kewensis*], I have unfortunately lost, and I can only speak of it from recollection. It was of the encrusted section, and had pleasing pink flowers. Apparently it must have been one of the forms of the variable *S. cartilaginea*, which has white, pink, or purple flowers. Of the true *S. Frederici-Augusti*, which is said to have

Ecclesbourne, Sydney, Australia (see fig. 8, p. 15, depicting a portion of the lawn covered with *Sparaxis*). Whilst in Europe I was shown several varieties of *Sparaxis tricolor* in pots under glass, but when I explained how admirably this bulbous plant grew in the open-air in Australia, and how successfully Dr. Norton had grown them in grass, my hearers thought the effect of these plants when in bloom must be surpassingly beautiful. There is a greater number of varieties of *Sparaxis tricolor* grown at Ecclesbourne than in any other public or private garden in Australasia. This splendid collection comprises some thousands of bulbs, including hundreds of varieties having flowers of every conceivable hue, and the colouring of the petals is so rich and varied that many of them might be described as fantastic. When in bloom, the lawn rivals the richest mosaic work in colouring. Every spring-time many plant-lovers visit Ecclesbourne in order to see this beautiful sight. There is a history attached to these plants. In the early part of the last century Dr. Bowman, of Sydney, imported the original bulbs from South Africa, and gave some of them to the late Hon. James Norton, M.L.C., of Elswick; and forty-five years ago his son, Dr. Norton, made a selection from the descendants of these, and planted them at Ecclesbourne. Ever since then the process of careful selection of superior varieties has gone on, with the result above stated. It should be mentioned that during the last few years Dr. Norton has succeeded in raising a beautiful bright yellow variety which is looked upon as quite a novelty. In Australia, most varieties of *Sparaxis tricolor* produce seed in great abundance, and the seeds germinate readily under ordinary conditions. It might be added that there are growing amongst these varieties of *Sparaxis* a number of species of *Babiana*, *Freesia*, *Ixia*, *Tritonia*, *Triteleia*, and other choice bulbous plants which have a charming effect when in bloom. *Fred Turner, F.L.S., &c.*

NOTICES OF BOOKS.

THE AMERICAN CARNATION: HOW TO GROW IT. By Charles Willis Ward. (New York: A. T. De La Mare, Printing & Publishing Co.)

This is a very nicely-got-up book, and places before us the history of the Carnation and its culture from an American point of view. As there is some divergence of opinion on the relative properties of the English and American types of Carnation, it will be both interesting and instructive to consider the question on its merits. Mr. Ward traces the history of the Carnation for a period of 2,000 years; but in those early years America was "out of it." In later times, nearly all the poets and authors of Herbals are quoted, from Chaucer to John Gerarde. Old Parkinson is not included; Mr. Thomas Hogg, of Paddington, is quoted as an authority on the properties of a Carnation; and Mr. Ward truly remarks that in Hogg's time "only flakes, bizarres, and Picotees were considered good Carnations." And in reference to Hogg the author states "that the English grower strictly barred all Carnations with fringed petals." This is in direct contradiction to the American idea of a fine Carnation, for here the fringed petal is rather preferred. My own experience with American-bred Carnations is that those varieties with fringed petals are more easily grown under our conditions, and the blooms are also better keepers than the shell-petaled varieties.

The history of the Carnation in America began in 1840. A gardener from Lyons, France, named Dalmais, introduced the perpetual-blooming variety, and cross-fertilised the French type with a Flemish Carnation; and our author traces the history and development of the Carnation very

carefully until he commenced growing the Carnation on his own account in 1890. The later varieties I have not grown, but many of the varieties named were cultivated carefully under glass; but no one cared for them, and all were discarded except Lizzie McGowan and C. A. Dana. Since that, our collection contains Mrs. Thomas Lawson, which, when well grown, is a very beautiful and distinct variety.

Mr. Ward has much faith in the final triumph of the American type of Carnation. In a recent address, Mr. Carnegie stated that the time is coming when Canada will be absorbed by the United States of America; so Mr. Ward believes that "within the next generation we may expect to see the American race of Carnations in general cultivation throughout the horticultural world, wherever climatic conditions permit." We are informed that Belgian and German florists are sending their sons to the United States to serve apprenticeships in the Carnation establishments, returning in a year or two to engage in the culture of the American Carnation.

The development of Carnation culture in the United States during the last decade is certainly remarkable; and one cannot wonder at this, because the greater the quantity of flowers grown the higher are the prices. It is stated that there are 2,000 establishments devoted principally to Carnation culture; 7,000,000 to 8,000,000 Carnation plants are grown, producing annually 100,000,000 Carnation blooms. In the year 1890, the retail prices of Carnation blooms ranged from 25 to 50 cents, and at occasional times to 70 cents per dozen; whereas at the present time the retail prices in the larger cities of the United States are from 75 cents to 5 dollars per dozen; and in rare instances especially fine blooms are sold as high as 8 to 12 dollars per dozen blooms. Some of the less fortunate growers in this worn-out old country may think I am not quoting correctly, and that the author does not mean a single dozen of blooms for 12 dollars, that some large number or measure is intended. The statement is made at p. 34 of the book. The remarkable part of it is the fact that by increasing the output the prices rise. No wonder millionaires are as plentiful as Blackberries in America.

The culture of the plants must be inexpensive as compared with the English method. The propagation of the plants is the same in America as in England. The author fancies that the Carnation for winter-blooming is propagated in England by layering; at least he says it is largely practised. There he is in error; the plants are propagated by means of cuttings on bottom-heat in England, as in America, during the months of January, February, and March. The young plants are potted off in both countries into small flower-pots; but the after-culture is different, and must be all in favour of the American method for cheapness and also for the after-results.

Instead of repotting the plants several times, and growing them to the flowering size in pots, they are grown in fields, the ground being prepared by ploughing. The plough is also called into requisition in the preparation of the soil for "benching." Laying up the turf soil in heaps is found to be too expensive, it is therefore prepared somewhat as follows:—The manure is spread evenly on the "sod ground" early in September, and ploughed-in to the depth of 5 inches; this is harrowed over, another light coat of manure is given in November "and turned under, the ground being left in ridges, so that it will get a thorough freezing." In spring the ground is ploughed again two or three times, and thrown into ridges. This soil, after being worked as above, is taken into the houses, and the benches are filled up with it for planting.

The time of planting, method of planting, and all the minor details of the work are carefully

described. The soil on the benches is sterilised with steam-pipes. These pipes are carried through the soil on the benches at a depth of 6 inches. Holes are made in the pipes at intervals, and steam is forced into them for twenty to thirty minutes, until the soil is heated to 190° to 212°. "This is sufficient to kill all the bugs, earth-worms, wire-worms, and other insects which infest the soil, and to destroy all weed-seeds and spores of fungi." The surface of the soil is covered with sheeting of some kind before the steaming process is started. I had marked many more passages which might be dealt with, for the author is certainly an enthusiast and knows what he is writing about. One passage must not be passed over—what he calls the theory of luck. He does not believe in luck, nor do I. When a gardener tells me he has been unlucky with his Carnations I am anxious to know where the luck comes in. A grower who understands the requirements of his plants and minds his own business, instead of looking after other people's, is never found growling about being unlucky. A man may be unlucky with his Cabbages and Pumpkins if he does not sow his seed at the right time and see that it is well sown, that the seedlings are pricked out when ready, the ground prepared for them, &c. All garden work wants doing at the right time, and the gardener who is always telling us that there is no time to do this, that, or the other part of his work, had better give up gardening and enlist, or try some other easier sort of work.

There is no reason why the bench culture of Carnations should not be tried in England. Gardeners who have quantities of cut Carnations to supply in winter, or who are growers for market, might well pause and consider whether the system is not well worth a trial. Mr. Ward's book will give all the information required. The amateur who does not know a Carnation plant from a Shirley Poppy will find full instructions from the seedling or the cutting to the full-grown plant; while the practical gardener will be sure to find something new, something to please and to instruct him in the ways of the American cultivator. Insect pests and diseases are fully noticed, and instructions given for their extermination.

I can recommend the book to amateurs, gardeners, and market growers. It is well printed on fine paper; the illustrations of the houses and photographs of the different varieties of American Carnations are excellent illustrations of the flowers desiderated by the American people. At p. 26 is an illustration of Governor Roosevelt, the outer petals irregularly and deeply serrated, the central petals notched, and of the worst possible form; but the question of form in Carnations must stand over, and also that of the use of stimulants. *J. Douglas.*

DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES.

THE issue of M. Cogniaux's work for May just to hand contains fourteen subjects, mostly old species, or slight variations of them:—

Arachnanthe Cathcartii.—Also known in gardens as *Vanda* and *Esmeralda*. Discovered by Sir J. D. Hooker in the moist valleys in the Eastern Himalaya in 1848. Flowers large and of thick substance, yellowish, heavily barred with red-brown.

Cattleya Mossie variabilis.—A pale variety, with lavender-tinted flowers.

Cattleya Percivaliana grandiflora.—Flowers bright purplish-rose with maroon disc and yellow marking in the tube of the labellum.

Cattleya × *Whitei.*—A natural hybrid between *Cattleya Schilleriana* and *C. labiata* Warneri. Flowers purplish-rose, darker on the labellum, which has yellow markings at the base.

Cypripedium × *Chapmanii* (Curtisii × *bellatulum*).—Flowers finely tinged and spotted with purple, the white ground showing on the outer halves of the dorsal sepal and petals.

Cypripedium × *Gaudianum* (Curtisii × *Harrisianum superbum*). Flowers tinged and veined with dark rose, the petals and dorsal sepal having some dark purple spots.

Dendrobium × *Ainsworthii grandiflorum*.—Flowers white, tipped with dark rose. Disc of lip purple with a yellow band. It is the plant well known in gardens as *D. × splendidissimum*.

Dendrobium sanguinolentum.—A Malayan species introduced in 1842. Flowers in short racemes, white, tipped with purple. Disc, yellow.

Epidendrum atropurpureum Lionetianum.—Sepals and petals greenish, stained with purple. Lip pale rose striped with darker rose.

Houlletia odoratissima.—Sepal and petals orange colour shaded with red. Column and lip whitish with minute purple spots. Imported from New Grenada in 1852, and recently by M. Fl. Claes, of Etterbeck, Brussels. This figure commences the genus *Houlletia*.

Marillaria tenuifolia.—A Mexican species, introduced in 1837, and flowered in the gardens of the Royal Horticultural Society in 1839, and now a very common plant in gardens. Flowers yellowish, marked with red.

Miltonia Phalaenopsis.—Flowers white, with yellow crest and purple markings on the lip.

Saccolabium bellinum.—The well-known species discovered in Burma by Boxall in 1873. Sepals and petals greenish-yellow, spotted with red-brown. Lip white, with yellow disc and rose-coloured markings.

Zygopetalum brachypetalum pallidum.—Flowers resembling those of a small *Z. Mackayi*. Sepals and petals greenish, blotched with purple. Lip white, striped with rose-purple.

ORCHID NOTES AND GLEANINGS.

LUISIA TERES.

As a result of instructions given in Japan by the Hon. N. Charles Rothschild, when on a voyage round the world some time ago, a number of interesting Orchids has been received by him, some of which are at his gardens at Ashton Wold, Oundle, and part at Tring Park.

Luisia teres, one of the rare Japanese Orchids, is now in flower at the latter place. In growth, its slender stems and cylindrical leaves resemble a small *Vanda teres*. The flowers are borne, to the number of three or four, on a short, erect spike, proceeding from the stems at the axils of the leaves. The individual flowers are about ½ inch in length, the sepals and petals in colour greenish, with purplish lines along the keels at the back. The labellum, which is distinctly bilobed at the apex, is dark purple. When mature, the sepals, petals, and front of the labellum close over the column, leaving window-like openings at the sides, as in the genus *Cryptophoranthus*. It is probable that at certain hours of the day the petals may expand, and again partially close, as seen in the specimen sent, and which expanded perfectly in water shortly before noon. It would be well to observe the plant.

A curious little Japanese *Bulbophyllum* (?) is about to bloom; and of those which Mr. N. C. Rothschild brought home, the pretty *Aërides japonicum* and *Angraecum falcatum* have both flowered well.

LELIO-CATTELEYA × LADY MILLER.

A fine flower of this pretty hybrid between *Cattleya granulosa* *Schofieldiana* and *Lelia cinnabarina* is sent by Eustace F. Clark, Esq., Chamonix, Teignmouth, who calls attention to the features of the *C. granulosa* being obscured in the hybrid, and its unexpected development in the

direction of *L. C. × Hippolyta*, or other of the *C. labiata* crosses with *L. cinnabarina*, its flowers being equal to the best of them in size and showiness. The flower is more than 5 inches across, of a peculiar coppery-orange tint slightly tinged with rose; the petals and side lobes of the lip also bearing a delicate veining of rose. The front lobe of the lip is purplish-crimson, and its surface is studded with minute papillæ. These, and the erected side lobes of the lip, are the best traces of *Cattleya granulosa*, the thick substance of which and other features do not appear. It was first sent to us in 1901 by Mr. J. Hamilton, gr. to Sir Jas. Miller, Bart., Manderston, Duns, N.B., who was the first to flower it.

ONCIDIUM LAMELLIGERUM.

This handsome species, originally described by Reichenbach in the *Gardeners' Chronicle*, 1876, p. 808, is still rarely seen in gardens, as it has

the same garden, and shows that notwithstanding the acres of Roses that almost surround the residence, the private garden, with its soft lawns and flower-beds and borders, is not one whit the less appreciated. So many Roses may be seen in the view given below, it is not surprising that in the view given below the flowers are of other species, and so afford a contrast, not to say relief, to the abundance of Roses. It is interesting to recall the fact that this nursery and garden is situated on one of the highest points around Colchester, being on a level with the steeple of the parish church. In spite of its altitude there is such abundant water even near to the surface that it is necessary to conduct the surplus away by means of an efficient system of drainage. The late Mr. Cant left two sons, who are as enthusiastic as their father was, and their success has been exemplified even in the present season.

FIG. 9.—MESSRS. B. R. CANT AND SONS' PRIVATE GARDEN, COLCHESTER.
(Photograph by F. Mason Good.)

never been imported in quantity, as have its allies, *O. macranthum* and *O. serratum*. A fine example is sent by Mr. H. Arthur, Revidge, Blackburn, the popular Honorary Secretary of the Blackburn and District Horticultural Society, who states that it was purchased as an imported plant for *O. macranthum*. The very long flower-spikes bear large handsome flowers about 3 inches in diameter. The upper sepal is stalked and nearly circular, brown margined with yellow; the narrower and longer lateral sepals also brown; and the broad, incurved, fringed petals light yellow, spotted with purplish-brown on the inner halves. The lip is purple on the narrow side lobes, and lighter on the front lobe, and the singular crest white and purple.

IN MESSRS. CANT'S GARDEN.

An illustration was given in last week's issue of the famous hedge of Ayrshire Roses growing in the private garden attached to the residence in the nursery of Messrs. B. R. Cant & Sons, Colchester. The house was inhabited for very many years by the late Mr. Benjamin K. Cant, who died there on July 17, 1900, in his seventy-fourth year. In fig. 9 is given another view from

MARKET NOTES.

PELARGONIUM TRICOLOR MASTERPIECE.

This stands undoubtedly well to the front as a bedder. It is in growth second to none, and the markings of the foliage are extremely rich and beautiful, and the zone is broad and black. Messrs. B. S. Williams & Son have a good stock of this at their Finchley nurseries in trial beds, as likewise of Mrs. Pollock. As the beds are open to the south, the display will be a fine one. The last week in June, Covent Garden Market was specially well supplied all round with tricolor Pelargoniums, and I observed, besides Masterpiece, Mr. Henry Box, another excellent variety.

BORDER CARNATION MRS. HERBERT J. CUTBUSH.

This is a very fine variety, and several houses filled with the plants are coming into bloom at the Finchley nursery of Messrs. Cutbush. The colour is a deep rose; the individual blooms are of a large size, and perfect as regards form, and the petals of good substance. It is a free-flowering variety, good for growing in pots. So far demand exceeds production, and the raiser has had no opportunity of testing its flowering

capability as a two-year-old, but he learns that it does well when aged. This old-established firm is about to erect another lot of glasshouses for the cultivation of *Souvenir de la Malmaison* Carnation var. *Nautilus*. This, one of Mr. Martin R. Smith's raising, is now met with on the exhibition table, either grown in pots or in the cut state. As seen at Messrs. Cutbush's nursery in quantity a better idea of its value can be formed than when cut or when growing in small quantities. The blooms are of a pleasing, distinct, flesh tint, and models of good form. It is a continuous bloomer on two-year-old plants. The Malmaisons have a great fascination for the public, and the present market prices for cut bloom reach tempting figures.

LYCHNIS VISCARIA SPLENDENS, FL. PL.

This is a good wet-weather plant, the flowers enduring rain without disfigurement or decay. Once established, the plants should not be disturbed for years, and they will make a fine display. The plant can be propagated readily from cuttings, which will flower the next season. A very showy, useful border or rock plant. *Stephen Castle*.

EUCHARIS GRANDIFLORA.

This charming free-flowering bulbous stove plant is most accommodating in the way of flowering, and the umbels of large pure white fragrant flowers, borne on stout stems well above the large, handsome green leaves, are very telling in effect, either as vase or specimen plants, or intermixed with other subjects in stove or warm greenhouse. If given a compost consisting of fibrous peat and loam in about equal parts, and one part of pulverised cow-manure and small charcoal, with a liberal dash of sharp sand added, and a minimum temperature of 65°, with careful application of water at the roots, the plants will grow and flower freely. In potting, use clean pots, and afford good drainage, putting a large convex crock over the hole in the bottom.

In breaking up large plants, let the bulbs be sorted into three or four different sizes. The size of the bulbs should govern the number to be placed in each 4½-inch, 6-inch, and 8-inch pot, three average-sized bulbs being put into the first-mentioned size, five in the second, and nine in the third. Specimens may be made up by potting a dozen or two large bulbs in large pots. In potting, bury the bulbs a little below the apex, and make the compost quite firm under and around the same, and then afford water to settle the soil.

The chief cultural points to be observed in the cultivation of *Eucharis* are ample drainage, water somewhat sparingly applied at the roots until numerous roots have pushed into the soil, and applications of mild liquid-manure in a tepid state twice a week after the flower-spikes have appeared, and the maintenance of a uniform warmth, together with moist conditions, until the flowers begin to open. At that stage, the plants may be removed to a structure having a cooler and drier atmosphere, in which case the soil should be allowed to get fairly dry before water is applied at the root.

I have found it a good plan to stand the pots of freshly-potted, dormant bulbs on thin boards resting on the hot-water pipes in forcing-houses, where, if the soil be kept quite moist, rooting and leafing soon take place. The plants may then be transferred to the staging over the hot-water pipes in a plant stove. Weak liquid-manure should be afforded the plants for a few weeks after they have gone out of flower, and afterwards water should be gradually withheld previously to discontinuing the supplies altogether a few weeks later, so as to rest the plants; the pots being turned on their side the better to insure the plants having this enforced rest, and be kept to

the stove while so resting. Plants thus treated will send up a crop of flower-spikes twice or thrice in the year within a month or six weeks from the time water is withheld from the roots. The pots should then be stood in their proper position, the soil pricked over with a pointed stick, top-dressed with a little of the mixture indicated above, and well watered; repeating the operation each time the plants have gone out of flower. *Eucharis* do not need disturbance at the root for periods of two or three years; indeed, not before larger pots are absolutely necessary, or the bulbs reduced in number. *H. W. W.*

VARIATIONS IN ANIMALS AND PLANTS.*

(Concluded from p. 405.)

MR. BATESON divides variations into two classes—*substantive*, i.e., in the substance of the parts; and *meristic*, relating to the number of parts. Both of these are common enough in plants. Thus, maritime plants are often fleshy in "substance," but the cause has been shown to be due to salt.

Similarly, members of the order *Cactaceæ* and S. African *Euphorbias*, &c., are fleshy-stemmed plants. Such is, presumably, i.e., by inductive evidence, the result of response to drought. These are now genuine and constant varietal or specific characters; but meristic differences may or may not be worthy of either term; for "fours," "fives," and "sixes" may be found in the whorls of flowers on the same corymb of Elder, and are merely due to relative degrees of nourishment at the disposal of the flower-bud. Such cannot be depended upon for constancy. Similarly di- and tetramerous flowers are not uncommon in Monocotyledons, but they do not lead to varieties or species in Nature, unless the conditions of life be constant, which gave rise to them. Thus the relatively barren soil of sandy heaths is correlated with the permanently four-petalled flowers of the Tormentil, and the species of *Gentian* (*G. campestris*) is regarded as specifically different from another (*G. amarella*) by having a 4-merous calyx instead of a 5-merous one, as in the latter species, solely because the difference is constant.

Number, of course, plays an important part in the classification of flowers, but its value entirely depends upon its constancy. In the author's quotations from Mr. Bateson, this element of fundamental importance does not seem to have been sufficiently tested or insisted upon. Hence the value of these statistics is greatly weakened so far as they are presumed to point to true "varietal" variations.

To give one more instance. Of the numbers of the leaflets of Clovers, bearing 3, 4, 5, 6, or 7, the maxima were 3, 5, and 7. Now this is simply in accordance with the evolution of compound leaves from simple ones. It is obtained by a "severance" of the first pair from a simple blade, and then by another pair being cut off from the latter (speaking metaphorically, of course), so that any large plant, say of Cinquefoil, will bear leaves with 1, 3, 5, and 7 leaflets, and none with 2, 4, or 6.

As with Phyllotaxis, the observations on Clover lead to nothing of a truly varietal nature. No botanist regards the common "4-leaved form" of the Clover, or the "even-

leaved" form of the Ash-leaf as varieties of the Clover and Ash respectively.

Dr. Vernon quotes Darwin as saying:—"The more diversified the descendants from any one species become in structure, constitution, and habits, by so much the more will they be better enabled to seize on many and widely diversified places in the polity of Nature, and so be enabled to increase in numbers" (p. 66).

He does not see that Darwin is here "putting the cart before the horse"—a process which results from his theory of selection from indefinite variations. The fact is, as Dr. Vernon seems fully to admit in his later chapters, that "the diversification in structure, constitution, and habits," is brought about by the direct action of the "widely diversified" places through the responsive power of the plants themselves; but the author cannot altogether free his mind from the imaginary "agency" of Natural Selection. Dr. Vernon criticises my statement, that the cumulative influence of changed conditions of life are amply sufficient, without the aid of Natural Selection—in which I am only quoting Darwin, though it is corroborated by my own experience—and says: "By no means" . . . "probably in each case by far the larger portion must be ascribed to the ever-present and ever-acting agency of Natural Selection" (p. 391).

Dr. Vernon does not seem to realise Darwin's sharp distinction between "the Origin of Species by means of Natural Selection" (i.e., out of *Indefinite* Variations), and the Origin of Species "without the aid of Natural Selection" (out of *Definite* Variations), to use Darwin's own words. The former was an imaginary process, the latter is the "True Darwinism."

The third chapter deals with "Correlated Variations," and the author gives an account of Galton's methods of investigations and mathematical methods of representations. He proves that though all the organs of the animal body may vary together, yet each is a more or less independent variable. In plants there seems to be much less dependence than in animals, for if any one organ be the object of artificial selection, as a tuber, foliage, corolla or fruit, many races have been established of each, with but little or no change in other parts of the plant.

But all such fluctuating elements as have been measured, as parts of shrimps, crabs, earwigs, &c., do not lead one to detect any evidence of truly varietal and constant characters, upon which alone classification can be based.

As soon, however, as some more pronounced difference is observable, then a difference of habit or something in the surroundings is pretty sure to be suspected or detected, as at least apparently indicating a "direct action," to account for it, as Dr. Vernon notices in the case of Mr. Warren's observations on the crab, *Portunus depurator* (p. 81).

Nevertheless, Dr. Vernon remarks:—"All these results may be taken to show that every part and organ of the body is correlated with every other part in a greater or less degree. . . . The immense importance in evolutionary processes of such correlation, whereby when one organ becomes modified by the action of an agency such as Natural

* By H. M. Vernon, M.A., M.D., Internat. Sci. Series, vol. 88, 1903. (Kegan, Paul, Trench, Trübner & Co., 1903.)

Selection, others are modified also, is sufficiently obvious to need no discussion" (p. 84, my *italics*).

Dr. Vernon here falls into the only too common mistake of attributing "action" and "agency" to Natural Selection. Darwin insisted upon our remembering that it is only a metaphor,* though he often wrote as if he thought otherwise. Perhaps its true meaning will be seen from an example: An epidemic occurs. One individual in one family, two in another, three in a third, are attacked and die, the others may or may not be attacked, but live. That is an example of natural selection. It is only a name for a special "natural law" or "observed facts." The cause of the deaths is known, viz., microbes; and the cause of the survival is known, viz., a strong constitution capable of resisting the "action" of the microbes. Natural selection is only Nature's "Registrar of births, deaths, and survivals," and is neither an "agent" nor an "actor" in the drama of life.

No one can possibly deny the universal existence of natural selection as a natural law among living beings; but it was his attempt to introduce it in his theory of the Origin of Species on changes of structure, which constituted Darwin's original mistake. For in applying Malthus' theory to the animal and vegetable kingdoms in their entirety, he added "structure" as an element of destruction or survival, with which Malthus was not concerned at all. Many are the causes of elimination of the majority of any offspring, e.g., being devoured by enemies, being smothered by stronger individuals among plants, ill-luck as to where the seeds fall, starvation, drowning, &c. But it is *not* due to any slight changes of structure or form, as of "individual differences." These are not "matters of life or death," as Weismann seems to think. Nature does not make "injurious variations" as Darwin suggested, but always evolves the variations in response to the environment or in adaptation to the conditions of life. "New sub-varieties are thus formed without the aid of natural selection" as Darwin maintains.

Dr. Vernon of course, alludes to Weismann's theory that the body or soma, if it acquire any characters, such cannot be transmitted by heredity, i.e., in accordance with his own theory. Dr. Vernon, however, who does me the honour of quoting freely from my books, arrives at the same conclusion as myself, that such acquired characters can be, and most undoubtedly are, transmitted; but to meet the objection that it is inconceivable how the "somatic" effects can be transmitted to the "germ-cells," Dr. Vernon proposes an additional theory that it is done by internal chemical secretions which "pass into the circulation of the body, and there exert some important but unexplained influence on the general metabolism of the tissues" (p. 94).

Not being a zoological biologist, I am not competent to discuss the question from the point of view of one, but in plants I know of no evidence for it. Moreover, somatic characters, i.e., of the "vegetative system" of roots, stems, and leaves of many plants, are acquired long before any

* *Origin of Species*, &c., 6th Ed., p. 63. "It has been said that I speak of Natural Selection as an active power." . . . Natural Selection "only implies the preservation of such variations as arise and are beneficial to the being under its conditions of life."

reproductive organs exist, as the tubers of Potatoes, roots of Carrots, &c., foliage of Cabbages, &c. Yet all these have become hereditary traits, and "come true by seed." How the embryos have been able to acquire potentially the capacity of reproducing them is a mystery, but such is the case.

Part II. deals with *The Causes of Variation* under the two groups "Blastogenetic" and "Somatic." The former kind of variations are, according to Weismann: (1) Inequalities of

It is perhaps more applicable to animals than plants, for the evidence of characteristics acquired by the soma and inherited is simply overwhelming in the case of plants.

The fifth chapter, in which blastogenetic variations are continued, contains the mathematical details worked out by Galton, Pearson, Mendel, &c. They are clearly stated, but if one looks for some unexceptionable evidence bearing upon the origin of new variations of structure, which a systematist demands, there is little or nothing

FIG. 10.—ALPINE IRISES NEAR THE SIMPLON PASS (FROM MR. CAPARNE).
(SEE P. 22.)

nutrition acting on the individual constituents of the germ-plasm; (2) Amphimixis or sexual reproduction. Both of these sources would at first appear to be more favourable towards supplying help in the investigations for true varietal variations than individual differences, but they seem to be very limited in their effect as causes. The reader is referred to the experiments with rabbits, &c., the conclusion of the author being, that:—"The evidence so far available seems to render it highly probable that the major part of the variation exhibited by organisms is of blastogenetic rather than of somatic origin."

forthcoming. Hence, one is not surprised to hear that Prof. Pearson has arrived at the conclusion:—"Whatever be the function of sex in evolution, it is not the production of greater variability" (p. 180).

If the question of hybridity were introduced, then the result of cross-fertilisation is well known to introduce practically an almost unlimited amount of variation. But this is, of course, outside Evolution, properly so called.

Coming now to the true basis of the cause of Evolution—the Responsive power of Protoplasm to the direct action of changed conditions of life

—the author has deduced, independently of, but contemporaneously with Prof. Pearson, the law that:—"The permanent effect of environment on the growth of a developing organism diminishes rapidly and regularly from the time of impregnation onwards" (p. 199). And he draws another conclusion which is not new:—"Increased variability of environment leads to increased variability of the organisms subjected to it." It has long been observed that more pronounced varieties are seen in a species as it spreads from the centre of its geographical area, simply because it meets with greater variations in the environment.

I think the author is not quite right in his belief that "want of adaptation" is a real factor in variation. Surely it is that until the organism is thoroughly adapted to new conditions of life, it will continue to respond to them, until equilibrium is established. This is apparently the interpretation also of the above "law." Horticulturists place this period as being from five to six years, on the average, before a trustworthy fixity of permanent characters can be secured by heredity.

In quoting several cases of the effect of environment, he alludes to aquatic plants. My argument is that inductive evidence, derived from a great number of dicotyledonous aquatic plants having dissected leaves when they are submerged, satisfies the requirements of "cumulative coincidences," as establishing a natural law, viz., that the water is the cause, and the dissected blade the effect. Dr. Vernon observes that this is "tacitly assumed" to be true, and adds: "It is of course possible that they are partly or even largely indirect, and that the change of habitat merely calls up latent characters long since possessed by the ancestral plants which lived in similar circumstances." This is true for, normally aquatic plants, which have no stomata, and are raised on land by seed, when an abundance of stomata are at once formed, showing that such an aquatic plant as *Ranunculus aquatilis* is descended from a terrestrial species; but the converse is not applicable to account for the numerous degraded characters observable through all the tissues of aquatic plants. Experimental evidence, however, here comes in to corroborate the above induction, for Mr. McCallum grew the plant *Proserpinaca palustris* of the U.S. (which is amphibious, and has dimorphic foliage) in water in which salts were dissolved; these set up osmotic action, which withdrew the superabundance of water from the protoplasm, when the normal aerial or complete form of leaf was at once developed under water.*

The effect of increase of food is discussed, and it is shown that the number of petals of Buttercups increased as additional food was supplied them; in wild flowers, the maximum of the number of petals was five, decreasing rapidly to two; when transferred to a garden the numbers increased. Then the seed of the many-petalled flowers was sown, with the following result in early-flowering plants, viz., nine petals gave the maximum, and in late plants ten. We thus see that the normal pentamerous whorl was replaced by two cycles instead of one. As similar differences can be paralleled in wild flowers, as a permanent diminution in half-starved plants of dry districts, such as the *Tormentil*, some grasses, &c.; and while *Geranium* has ten stamens, *Erodium* has only five, it seems pretty clear that excess and diminution of food, if permanently maintained, may be real and efficient causes of variations in "number." Still, such are all due to the response of the plant to its environment, and fall under the usual source of variations.

Alluding to the great effects of cultivation, Dr. Vernon quotes Darwin, that "one cannot tell how much ought to be attributed to the direct

action of the environment, and how much to selection." This difficulty disappears if selection as a cause of "direct action" be left out of sight as superfluous; for selection does nothing. Because the florist isolates an individual plant which he wishes to preserve, by pulling up all the rest which he does not want, such isolation has no "direct action" whatever; any effect is solely produced by the environment. The gardener might have chosen any other individual, and this would have grown equally well, with or without the former.

In the Third Part, on "Variation in its relation to Evolution," the author restates Wallace's and Darwin's position, viz., Facts granted: (1) geometrical rate of increase; (2) severe struggle for life; (3) individual variations; (4) hereditary transmission; then (5) "it must follow that on an average, more of the organisms possessing favourable variations better adapted to their environment will survive than of those possessing less favourable ones. That is to say, the species will become gradually modified by the action of Natural Selection" (p. 336).

The fundamental error in this last assertion is, that it demands "indefinite variations" for Natural Selection to select from. They do not exist in Nature. Darwin in 1876 confessed that the "greatest mistake" which he made, was in overlooking "definite variations."* These are now seen to be universal, and, as Darwin said, "a new sub-variety is formed without the aid of Natural Selection." So Romanes also said, "If you prove that 'indiscriminate' variations do not exist, you destroy Darwinism *in toto*."

The general impression left upon one's mind after studying this book closely, is that the mathematical analyses and resulting formulae, curious and interesting though they may be, will not lead us to the true source of the origin of species. The observers, to begin with, are on the wrong tack in basing them upon "individual differences." Darwin is, of course, responsible for this mistake, by inferring that a similar source of variations would be found in the wild state, to the "exaggerated" individual differences which occur under cultivation. Wallace is quite right when he says "they rarely come within the limits of a species." All the laborious work in measuring the carapaces of individuals of one and the same species of crab, or of the length of sparrows, leads to nothing of importance for classificatory purposes, because not only are the differences too slight, but there is no evidence of their having any constancy, and changed conditions of life are not insisted upon.

At present, the conclusion appears to be overwhelming that all variations, upon which varieties and species can be based, are the "definite ones" which arise in all the offspring alike, which are submitted to the same direct action of a changed environment. Then, if they remain for five or six generations under the same conditions, the "acquired" characters become retained and relatively fixed, whether they arose blastogenetically or somatically. *George Henslow*.

The Week's Work.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bicton, Budleigh Salterton, Devonshire.

Stocks.—These, when well grown and flowered, are useful subjects during early spring, and in order to get nice plants by that date seed should now be sown in pans or 6-inch pots, carefully drained, and filled with similar material as that advised for *Humeas* in last week's *Gardeners' Chronicle*. Having sown the seeds, place the pots, &c., in a frame, which shade from the sun with a mat till the seed germinates, after which in a few days they may be stood outside. Apply water with

care. Eventually prick the seedlings into boxes 3 inches apart, and before they crowd each other plant them out at 9 inches asunder. When grown in pots, lift the plants, each with good balls of soil, in October, putting three plants in a 7-inch pot. Mix a considerable quantity of lime-rubble with the loam that is used, and plunge the pots in coal-ashes in a cold frame. The East Lothian and the Intermediate varieties are those to be sown at this date.

Salvias.—Cuttings rooted in April will be ready for their final shift into 8 and 10-inch pots, the variety *Azurea grandiflora* doing well in 8-inch, and splendens, rutilans, Heeri, and gesneriflora in the larger size. Let the plants be liberally treated as soon as the pots are filled with roots. Syringe them about 3 P.M. in hot weather; secure the growths to a neat stake, as they easily snap off with the wind, and stand the plants in a sunny position out-of-doors, not allowing them to suffer lack of water. The compost recommended by me for potting *Chrysanthemums* a few weeks ago is suitable for *Salvias*. After they make a fresh start nip out the points of the shoots, doing the same a few weeks later; but do not pinch *S. azurea grandiflora* too freely or the racemes will be short.

Francoa ramosa.—This is a most useful greenhouse flowering plant during the next two months, and requires liberal feeding now that the flower-spikes are pushing up; and by placing part of the stock under a north wall, a lengthened period of bloom may be had. Support the spikes to a neat stake, but do not tie in too stiffly, as the plants show to better advantage when allowed a certain amount of freedom. *F. appendiculata* and *F. sonchifolia* are also worth growing for variety, being pale red or pink with a dark blotch at the base. Young stock should be placed in 4-inch pots and kept in a frame for a week or two longer; about equal parts loam and leaf-soil with a little sand will suit them.

Cinerarias and *Primulas*.—Transfer to 3-inch or 4-inch pots the plants from the earliest sowings, using similar soil to that just mentioned, keeping close for a few days, and shade from the sun. Cold pits or frames having a coal-ash bottom afford the best position for these plants during the summer. Dew the plants overhead mornings and early in the evening; and fumigate lightly two successive evenings should green-fly appear. Prick out into pans or boxes later sowings, and treat as before mentioned.

FRUITS UNDER GLASS.

By T. H. C.

Tomatos.—Plants in pots recently top-dressed will require abundant supplies of liquid manure and an occasional sprinkling of Thomson's Vine-manure, followed by an application of water. Let lateral shoots be pinched short back, and remove that part of the foliage which deprives the fruit of the benefits of direct sunlight. Do not afford water in excess, but incline rather to the dry side in affording water to plants growing in borders, and maintain buoyant conditions in the house. Ventilate freely at the top and bottom in warm weather.

Pot Vines.—Afford good cultivation to Vines in pots that will be forced next year, guarding, however, against the production of soft, sappy growth difficult to mature. Farnyard-manure-water and Thomson's Vine-manure may be afforded when the roots have permeated the soil in all directions. Pinch off tendrils, and stop lateral and sub-lateral shoots at the first leaf, and syringe the foliage daily, and admit air freely in fine weather, and in greater quantity towards the end of the month, so as to mature the Vines. Keep a night temperature of 70° and 80° to 85° by day, and damp down frequently on days that are bright and warm.

Young Vines.—The lateral shoots on Vines planted this year should not be shortened or root action will not be vigorous; at the same time, do not allow them to become overcrowded, but regulate them in such a manner that the chief leaves may have space for development. Syringe the Vines once daily, and maintain a moderately moist atmosphere. Close the house about 3 P.M., allowing the warmth to rise to 80° or 90°; the night temperature ranging from 65° to 70°.

* *Botanical Gazette*, vol. xxxiv., August, 1902, p. 93.

* In a letter to Prof. Wagner, of Munich, 1876.

Early Vineries.—Those vineries from which the Grapes have been cut should have the woodwork and the foliage of the Vines cleansed with the garden-engine or water-hose, and all superfluous growth removed from the Vines, being careful to preserve the leaves at the base of the laterals, so that the buds for producing next year's fruiting laterals may be properly developed. If necessary, apply a rich mulch of farmyard manure to the borders, the manurial properties of which will be carried down to the roots when water is applied. Where no mulch is necessary apply liquid-manure or some artificial fertiliser. Open the ventilators widely night and day, and for the present continue to damp down by day in bright weather. Muscat of Alexandria and other Vines having ripening crops of fruit should be afforded a dry atmosphere and more or less constant ventilation, according to the state of the weather. Let the paths be damped down in dry weather, the humidity arising therefrom refreshing the Vines without it being harmful to the Grapes. Afford Muscats a night warmth of 70°, and other Grapes 5° less. Lady Downes approaching the stoning stage requires a constant circulation of air to prevent the scalding of the berries, therefore afford some amount of ventilation during the night by the top and bottom ventilators, and increasing the amount early in the morning and at intervals during the forenoon, if it be called for.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PIGOTT, Bart., Wexham Park, Slough.

Asparagus, if planted on raised beds, often suffers in dry weather, and the system is only suitable for a very early crop. If the land be well drained and the soil sufficiently deep, the flat system is undoubtedly preferable for the general crop. Fish manure or Clay's fertiliser make excellent manures for Asparagus, if plenty of water be afforded the plants in dry weather; but failing these there is no better stimulant than the drainings from the stables. Let the beds be thoroughly soaked once a week during dry weather until the plants have completed their growth. Young beds should be mulched with manure from a spent Mushroom-bed, or if the soil is very light some well-rotted cow-manure will be better. In order to prevent the growths from being broken off by winds, insert some Peasticks between the plants, or a few strings of tarred twine drawn to stout stakes placed at suitable intervals will answer equally well.

Winter Onions.—The white Tripoli sorts that have finished their growth should be pulled up and laid in the full sun to dry. Other autumn-sown varieties, such as Giant Lemon Rocca and Improved Reading, may still be afforded ample supplies of manure-water.

Turnips.—A moderate sowing should be made forthwith in a somewhat shady position. If the weather be hot and dry, water the drills several times over previous to sowing the seeds, and where practicable cover the ground with garden-mats or several thicknesses of fish-netting, until the seeds have germinated. Sow the seeds on land that has not been dug recently, or if this is inconvenient make the soil very firm by treading. Sow thinly. Turnips delight in cool nights; water should therefore be afforded late in the day. The plants should be dusted over every four or five days with soot and wood-ashes. Turnips that have made medium-sized bulbs should not be allowed to remain too long in the ground, or they will become stringy and of little value, but be lifted and stored in sand or ashes under a north wall, where they will last in good condition for some time. Later sowings should be thinned, and the surface soil kept constantly stirred with the Dutch-hoe. During showery weather apply small dustings of artificial manure and soot in equal proportions over the surface of the soil.

Winter Greens.—If the planting-out of various kinds of Broccoli, Savoy, and Kales has been delayed from any reason, let the work be done at once. Ground which has been occupied with early Peas may be selected for this late planting, as it is essential to plant on very firm ground. Allow plenty of space between the plants. Plants put out thus late often suffer less in a severe winter than those planted earlier.

THE FLOWER GARDEN.

By J. C. TALLACE, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

Bedding Plants.—The difficulties which beset the Calendar writer on outdoor subjects when he tries to adapt his work to the country at large have been well exemplified during the past few weeks. In this district, with a rainfall of only just over 1 inch since May 18, plants are suffering greatly from drought, and the affording of water is an important operation. In the southern parts of the country there has been an over-abundance of rain, with the result that with a return of sunshine the surface has become hard and impervious to the air. All soils that have become thus compacted should be well stirred and broken up with the hand-fork or hoe; and to some extent this follows where water has been afforded artificially. Beds of zonal Pelargoniums should have the older flower-trusses, together with decaying leaves, frequently removed, so as to relieve the strain on the plants and induce good growth. This sort of treatment should be applied, so far as labour serves, to all kinds of flowering bedding plants, especially to such as have a tendency to produce seeds early. The pegging down of trailing plants, the training of climbers, and the staking and tying of the taller bushy plants, such as the early-flowering Chrysanthemums, are operations that will now need constant attention.

Pinks.—Pipings, if struck in the manner recommended some time ago, if now ready for removal, may be set out singly at about 3 inches apart in a nurse-bed for transplanting in the early autumn, or they may go direct into the places where they are intended to flower. The former is perhaps the better method, as when planted all together they are more readily looked after. Should the weather be bright, afford the plants a thin shade during the hottest hours.

Wallflowers.—Seedlings will now be of a sufficient size for pricking off. When taking them from the seed-boxes or bed, pinch off a small portion of the tap-root, in order to induce the formation of numerous lateral roots, and plant in a rather poor soil and an open situation so that the growth may be firm.

Hollyhocks.—Seedlings grow better if transplanted direct from the seed-bed to nurse-beds when of small size, and again transplanted either late in autumn or early in spring to positions where they are to flower. Hollyhocks require an open position and good rich soil.

Foagloves sown early may be similarly treated, but an open position is not so necessary for these plants; the soil, however, should be rich and well-drained. In the early autumn they may be planted where they are to flower.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Layering Strawberries.—This work should be taken in hand forthwith, so that strong plants may be obtained for planting in August. The soil on which Cucumbers have been grown forms a good medium in which to layer the plants. If pots be employed, let them be of 3 inches in diameter—60's. Care should be taken in selecting the runners, as it frequently happens that many of them are injured whilst the fruit is being gathered. Let each runner be fixed firmly on the soil by means of a wooden or wire peg, and stand the pots as close together as possible in alternate spaces between the rows, for convenience in affording water. During dry weather the layers will require water twice and thrice a day. Good varieties on most soils are James Veitch, The Laxton (a very strong grower at Dropmore), Royal Sovereign, President, Sir J. Paxton, Elton Pine, and Laxton's Latest-of-All. On suitable soils, British Queen cannot be beaten for flavour and size, and this variety should always be grown in gardens of which the soil is suitable.

Hints on Work in General.—Raspberries are commencing to colour, and in gardens where thrushes and blackbirds are numerous, nets must be placed over the rows forthwith, making them secure against these marauders. It is good practice to make a final thinning of the canes before this is done; and where they are suffi-

ciently advanced in growth to be fastened loosely to the stakes or wires with bast or soft string so that they do not get injured whilst the fruit is being gathered. Autumn-fruiting varieties should likewise receive attention in this matter; but the canes should not be tied up closely; on the contrary, loosely, so that the sun and air may mature them properly. The weather during the past week having been dry and hot has afforded a good opportunity for destroying weeds; and this useful work must be actively pushed on, so as to get them cut down before seeding can take place. Ply the garden engine on wall fruit-trees about 4 P.M. on bright days.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury

Ventilation.—The early part of the present season was very unfavourable to Orchids, especially to those of the warmer section that commence to grow early in the spring. It was necessary to use much more fire-heat than is usual at that period. Since the welcome change to summer weather, it has been possible to maintain a healthy atmosphere in the houses by admitting plenty of fresh air at all times, and using as little artificial heat as possible. The question of ventilation is one that the cultivator should study carefully. Cold draughts blowing directly upon the plants must always be avoided, and this may be done if care be taken to ventilate on the leeward side of the house. It is a mistake to close the houses early in the afternoon, and leave them closed until next morning. At Westonbirt, bottom air is left on the warmest houses during the night whenever weather permits; and in the intermediate and cooler divisions a little top air is allowed whenever practicable. The ventilators are opened in the evening after the houses have been closed for a few hours. I am satisfied that the plants make harder and stronger growth than they would do if they were shut up all night in a close and stuffy atmosphere.

Shading.—Such plants as Cypripediums, Odonoglossums, and other shade-loving species will require shading during the middle hours of bright days, especially if the houses are in an exposed position. If a layer of thin tiffany be tacked over the roof, or a thin coat of whitewash put on, it will answer the purpose well. The blinds need not then be lowered so early in the morning, and may be raised earlier in the evening. To such houses as contain Cattleyas, Lælias, Dendrobiums, Calanthes, &c., that require plenty of sunlight, the early morning and late afternoon sunshine may be admitted with advantage.

Damping the Houses.—Abundance of moisture is now needed in all departments, therefore the syringe or hose-pipe should be used freely for damping the floors, walls, and stages, thoroughly doing this twice or thrice daily. The Muratori hand-sprayer should also be brought into use on bright days, for damping the plants overhead in the morning, and again at closing time in the afternoon. Nearly all Orchids benefit by overhead spraying on dry, hot days, and the extremely fine mist-like spray produced from this instrument is beneficial to all plants that cannot endure heavy syringing, there being no danger of the growths becoming filled with water if due care be taken in using the sprayer. For seedling Orchids the "Muratori" is invaluable.

INSECT PESTS TO FARM CROPS.—With *The Profitable Farm and Garden*, June 20, was presented a coloured plate of the chief farm crop pests. The plate shows such well-known pests as the Turnip Sawfly and its larva, the Wireworm and its parent, the Leather-jacket Grub, Corn Thrips, False Wireworms (Millepedes), and the Cockchafer grub. The pests having been portrayed clearly in their distinctive colours, the merest novice will have no difficulty in recognising them. The plate will not only be of special value to the agriculturist, but will be welcomed by school teachers in rural districts, as well as by agricultural instructors.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 14	Cambridge Horticultural Society's Show.
	National Rose Society's Northern Show at Glasgow.
	National Sweet Pea Society's Exhibition at Earl's Court.
WEDNESDAY, JULY 15	Rose Shows at Forby, and Thoroton Heath.
	Ipswich Horticultural Show.
	Nottingham Horticultural Show (two days).
THURSDAY, JULY 16	Highbate Horticultural Society's Show.
FRIDAY, JULY 17	Royal Botanic Society: Lecture.

SALES FOR THE WEEK.

FRIDAY, JULY 17—Imported and Established Orchids; also 1000 Imported Crisps, at Messrs. Protheroe & Morris' Rooms, 67 & 68, Cheapside, E.C.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—63.3.

ACTUAL TEMPERATURES:—

LONDON.—July 8 (6 P.M.): Max. 71°; Min. 49°.

July 9 (Noon): overcast; warm, 78°.

PROVINCES.—July 8 (6 P.M.): Max. 68°, South-eastern Counties; Min. 47°, Shetland.

FROM the Royal Botanic Gardens, Kew, has been issued a second edition of the Hand List of Conifers growing in that establishment. The number of Coniferous plants now enumerated includes two hundred and forty-six species, and four hundred and fifty-one varieties, named and arranged according to the most recent information. Mr. BEAN contributes some interesting details relating to the dimensions of some of the principal species—for instance, the Japanese *Abies brachyphylla*, one of the most desirable of comparatively recent introduction, measures 29 feet in height; *Cedrus atlantica*, 60 to 70 feet; *C. Libani*, 69 feet; *Cupressus macrocarpa*, 49 feet; *Ginkgo biloba*, 61 feet; *Picea Omorica*, the Servian Spruce, a recent introduction, thrives well at Kew, where it has attained a height of 17 feet and is a most promising species; *Pinus Coulteri*, 54 feet; *P. excelsa*, 62 feet; *P. flexilis*, 31 feet; *P. Lambertiana*, 63 feet; *P. Laricio*, 86 feet; *P. palustris*, 19 feet; *P. Strobus*, 74 feet; *P. silvestris*, 79 feet, &c. The Pinetum has been carefully developed on the lines laid down by Sir JOSEPH HOOKER, who made a special study of these plants, and is specially interesting from the juxtaposition of European forms with corresponding species from Japan and North America.

The collection is carefully named, and most of the trees are doing well. Some of the Spruces and Silver Firs thrive less well than the Pines and Larches, owing to unfavourable climatal and atmospheric conditions inseparable from Kew; but they are replaced when necessary by younger and healthier specimens, so that the Kew Pinetum remains, what Sir JOSEPH HOOKER intended it to be, the finest and most complete collection in the world. If the managers of the Brentford factories can be induced to abolish or even to diminish the injury caused by smoke (and something in this direction has, we believe, been accomplished), the Pinetum may long remain to interest admirers and students of Conifers, and to furnish practical hints to foresters and others concerned with the economic employment of the trees.

It may be well to remind those interested that the collection of cones formerly placed in the museum opposite the Palm-house, is now preserved in an annexe at the rear of the wood museum, an annexe which occupies the site of a previous building (if it be not the same modified). This building has special interest to those who have long memories or who are concerned in the Indian flora, for it was there for a long time that the collections brought home by Sir JOSEPH (then Dr.) HOOKER and Dr. THOMSON were stored. Here it was also that the plants were examined, sorted, and collated with the collections of GRIFFITH and others. Here also was laid the foundations of that noble *Flora Indica*, of which unfortunately only a fragment was completed, its place being taken by the very useful, very extensive, but less ambitious *Flora of British India*, now completed.

We have only to add that the Hand List is indispensable to lovers of and dealers in Conifers, and that it may be obtained direct from the gardens at the cost of a few pence.

WE are very often asked to recommend some means for the removal of Confervoid and other vegetation from the surface of Lily-ponds and similar surfaces of water. Raking off the growths, the services of ducks and swans, running off the water for a time, and other means all more or less futile and unsatisfactory have been recommended, but we confess we had never thought of employing the Bordeaux mixture for this purpose. Mr. HEDRICK, in *Gardening*, a Chicago journal, now tells us that in twenty-four hours after the surface of a pond in the grounds of the Michigan Agricultural College had been sprayed with Bordeaux mixture, every vestige of the green scum had disappeared, and at the end of another day it had sunk to the bottom. The spraying needs repeating after about a month. No harm accrued to the fish and frogs in the pond, but the mosquitos were materially checked. The Water-Lilies were unhurt, except on one occasion, when the mixture was used too strong. As circumstances, such as temperature, depth of water, and the like vary, it is recommended that the application be used tentatively and on a small scale in the first instance, so as to ascertain by experience the proper strength of the mixture.

SWISS IRISES (see Supplementary Illustration and fig. 10).—Comparatively few tourists visit Switzerland in spring—more's the pity!—the consequence is that it comes almost as a surprise to hear of Irises in Switzerland, so little are they associated in our minds with the Alps and valleys of that fascinating land. In few of the handbooks for tourists are they even mentioned. Nevertheless there are some nine or ten species, which may readily be grouped under the headings "bearded" and "beardless" respectively, and then by the number of the flowers and other characteristics. *I. virescens*, which occurs in the Rhone Vallé, near Sion, has pale yellowish flowers, appearing in early spring. *I. pumila*, also spring-flowering, well known as an edging-plant, has flowers varying in colour from blue, yellow, to white. *I. variegata*, a summer-flowering plant, has yellow flowers with purple veins. *I. pallida*, flowering in May, has violet flowers. *Iris germanica* is too well known to need description; it grows under the shadow of Mt. Blanc. Among the beardless species are *I. pseudacorus*, our common Flag, with yellow flowers; *I. sibirica* and *I. graminea*, both with violet-coloured flowers, flowering in early summer. For our illustrations (fig. 10 and Supplement) we are indebted to Mr. Caparne, who has known how to turn these beautiful flowers to advantage, and has enriched our gardens with a whole series of delightful novelties.

KEW.—Among the Orchids now in flower at Kew the following are noteworthy:—*Angraecum Eichlerianum*, *Bulbophyllum vitiense*, *B. barbigerum*, *Cirrhaea viridi-purpurea*, *Cymbidium rhodochilum*, *C. cyperifolium*, *Dendrobium tri-nervum*, *D. Jerdonianum*, *Diplocentrum congestum*, *Dipodium pictum*, *Eria late-bracteata*, *Eulophiella Elizabethæ*, *Geodorum candidum*, *Habenaria rhodocheila*, *Hæmaria Dawsoniana*, *Listrostachys forcipata*, *Megaclinium angustum*, *Masdevallia muscosa*, *Oberonia ensiformis*, *Ornithidium nanum*, *Pelexia maculata*, *Polystachya rhodoptera*, *Renanthera Storeyi*, *Sarcochilus Roxburghii*, *Spathoglottis kewensis*, *Zygopetalum cochleare*, and *Z. stapelioides*.

"THE BOTANICAL MAGAZINE."—The plants figured in the July number are—

Senecio clivorum, Maximowicz, tab. 7902.—See HENRY in *Gardeners' Chronicle*, 1902, ii., p. 217. Hort. Veitch.

Helleborus lividus, Aiton, tab. 7903.—A Majorcan species, previously not well defined, with the lobes of the leaves nearly entire, and with panicles of dull violet-coloured flowers flushed with green. Trinity College Botanic Garden, Dublin.

Iris lupina, Foster, tab. 7904.—See FOSTER in *Gardeners' Chronicle*, 1887, p. 738. Hort. Kew.

Huernia concinna, N. E. Brown, tab. 7905.—A Stapelia-like plant with small yellowish spotted flowers from Somaliland. Hort. Cambridge.

Calothamnus rupestris, Schauer, tab. 7906.—A West Australian shrub with linear leaves and clusters of flowers, the most conspicuous part of which are the five crimson stamens, each of which is much branched, the branches bearing a solitary yellow anther.

EXHIBITION SCHEDULES.—The schedule of prizes to be offered by the SCOTTISH HORTICULTURAL ASSOCIATION at the Chrysanthemum and Fruit show, to be held on Nov. 19, 20, and 21 next, is an unusually liberal one. The first class is for twenty vases of Japanese Chrysanthemum blooms in twenty varieties, three blooms of each; and the 1st prize, presented by the Lord Provost, Magistrates, and Town Council of Edinburgh, is a piece of plate value £20, and £10 in money. The 2nd prize is £20; 3rd, £15; 4th, £10; and 5th, £5. Another important class will be that for twelve vases of Japanese blooms. It

is very gratifying to us, after our repeated criticisms of the method of exhibiting Chrysanthemum blooms on boards, to note that in Edinburgh, where undoubtedly some of the finest exhibitions in Britain are held, the boards have been quite superseded by vases. The shows will gain so much in interest and attractiveness by the change, there need be no fear of a return to the inartistic appliances happily discarded. In addition to the classes for cut blooms, there is ample provision for Chrysanthemum and other decorative plants in flower, and with ornamental foliage. Grapes, Apples, and Pears will be shown in fifteen classes, and there are twenty classes or so for vegetables. The Secretary is Mr. PETER LONEY, G, Carlton Street, Edinburgh.

THE NELSON AND DISTRICT HORTICULTURAL AND INDUSTRIAL ART SOCIETY will hold a show of plants, flowers, fruit, and vegetables, and industrial handicrafts, on Saturday, August 22. The Secretary is Mr. T. STANLEY STOUT, 78, Brunswick Street, Nelson (Lancashire).

THE BEDALE ROSE SOCIETY'S EXHIBITION will be held on July 20. The Secretary is Mr. THOS. LINSKOTT.

M. MOTTET.—A prize of 250 francs has been awarded to M. MOTTET by the National Society of Horticulture of France in recognition of his work on Conifers, lately mentioned in these columns.

M. MOSER, of Versailles, has been promoted to the grade of Officer of the Mérite Agricole.

WATER CARNIVAL AT GHENT.—A carnival of flowers, to be held on the water, is to take place at Ghent on July 19, under the auspices of *l'Avenir Horticole*. Much interest is felt in the forthcoming fête, both by florists and by the participants, to whom seven sections are open. Many entries have been made, and from town and country strange craft of various descriptions are expected, notably some Zealand "chaloupes," manned by natives in their picturesque costumes. Everything promises well for the success of the procession of decorated boats, and we hope the weather will be fine on the occasion. Applications for detailed particulars may be had from *Avenir Horticole*, Place du Commerce, 13, Ghent.

THE POSITION OF BRITISH FORESTRY.—The rapid progress of the arts of peace in South Africa is marked by the appearance of the *Transvaal Agricultural Journal* (issued by the Agricultural Department), which, although only in its third number, shows great vitality in itself, and as regards the subject to which it is devoted. In a lecture on forestry printed in this publication, and contributed by D. E. HUTCHINS (Conservator of Forests, Cape Town), we find some pregnant remarks on the present state of forestry in Britain. The author says that "The position in England to-day, extraordinary though it appears to an outsider, is this: £20,000,000 sterling (or the total cost of the army before the war) is paid yearly for imported timber, which could be grown two or three times over within the British Isles if the forests had not been destroyed, or if they were restored by replanting." Mr. HUTCHINS has something to say about our present involved system of arithmetical tables. He remarks that:—"England is intensely conservative. We are the only civilised people who use weights, measures, and coinage which are not metrical; and the funniest part about this is, that while most other countries had to give up their money and adopt foreign money, we have a decimal system which can be adopted without changing our money; all that is required is to keep accounts in pounds, florins, "tickeys," and farthings, instead of pounds, shillings, pence, and farthings. The small adjustments required in the present value of the "tickey" and farthing

would pass unnoticed. However, this is a digression." Returning to his subject, the author sums up thus what England has to gain by forestry:—"1. £20,000,000 spent every year for wood that could be equally well grown at home; 2. Consols, at 2 per cent., national forests will return 3 per cent. and upwards; 3. Shrinkage in foreign sources of timber supply; 4. Fall in the value of land in Britain; 5. Livelihood for the country population; 6. Recreation ground for the townsfolk; 7. Aid in defending the country against invasion; 8. National insurance; 9. Abatement of smoke nuisance in towns. Pondering these things, the conclusion to a colonist and a forester is irresistible. England's great want at this time is national forestry; and as one reckons up the gains—£20,000,000 more produced yearly in the country, 75,000 people kept on the land; a forest playground for every man, woman, and child, with a fostering of the love of Nature and the beautiful; less smoke—when one considers that this can be produced at no final cost to the public exchequer (probably a considerable gain), and that for a moderate extra cost we obtain strategic forests and a defensive forest militia—pondering, I say, these things, the strange puzzle of the present position becomes stranger and stranger."

CLIP TUBE-HOLDERS.—There has been found hitherto a difficulty to fix flowers (in vessels of water) in awkward places, such as altar-screens, pulpits, pillars, mirrors, curtains, &c. The "Handy Clip," brought out by Mr. GODFREY, of The Nurseries, Exmouth, supplies what has been so long desired, and will prove a boon in decorating churches, halls, and rooms in general. It is a simple arrangement by which a metal funnel-shaped tube to hold flowers can be affixed in positions where it is not possible to drive a nail or otherwise fasten a support for flowers in water. Altar-screens, pulpits, pillars, mirrors, can easily be decorated without the aid of nails. A piece of string, cord, or small rope is tied around and suspended from any projection on which the "Handy Clips" can be fixed. By their aid, curtains, draperies, &c., may be quickly festooned with flowers. A bamboo or any other stick or rod may be stuck among the foliage or other plants, or in a flower-pot of soil, and can be readily dressed with flowers.

DUSSELDORF.—It is proposed to hold an International Art Exhibition in Dusseldorf from May 1 to October 23, 1904. Of this, the Horticultural section comprises a series of monthly shows. In May will be exhibited early-flowering plants and vegetables; in June, flowers in general, and Roses in particular; in July, summer fruits, flowers, and shrubs. Cut flowers and floral decorations will be included in every monthly exhibition. Besides these, exhibits are invited of all kinds of horticultural tools and implements, propagating-houses, greenhouses and conservatories, of irrigating machinery, mowing machines, of apparatus for the transplanting of trees, of thermometers, barometers, and microscopes, of rock gardens and the necessary cements and stones for their formation; of wines, liqueurs, and perfumes; and in short, of everything that, even in a remote degree, bears upon the subject of horticulture.

FRUIT-GROWERS' DEPUTATION TO THE BOARD OF AGRICULTURE.—A deputation from the National Fruit-growers' Federation and the Herefordshire Association waited on Lord ONSLOW on Monday, June 29, for the purpose of calling his lordship's attention to the very serious losses sustained by the industry through the ravages of blight and insect pests, and urging him to grant a Government enquiry into the whole subject, with a view to concerted action for their eradication. The deputation was introduced by Sir JAMES RANKIN, Bart., M.P., and Colonel C. W. LONG, M.P. (President of the National Fruit-

growers' Federation). MESSRS. RADCLIFFE COOKE, C. D. WISE, W. HORNE, A. GRANT, H. F. GETTING, and J. RILEY were all present, and spoke on the subject. Sir JAMES RANKIN referred to the Bill introduced by him in the present session, which provided that all nurserymen's stock should be inspected, and that compulsory dressing should be resorted to in their case. This Bill has been withdrawn, and there appears to be a general feeling among growers that any compulsory measure, if adopted, should be extended to orchards as well as nursery stock. The members of the deputation were, however, agreed that more information was required before legislation is resorted to; and they therefore pressed on the President of the Board the necessity for an official enquiry into the nature of the various orchard pests, and the extent to which they would be preventable, as well as to how compulsory dressing would be regarded by growers. His lordship said in reply that he quite recognised the importance of the subject, and was very glad to have heard the views of the deputation, with which he was generally agreed, and promised that a Departmental enquiry should be held, commencing work after the coming recess.

THE ROTHAMSTED EXPERIMENTAL STATION.—The experimental plots have again been visited by several parties, who were shown round by the Director. On June 30 Prof. JAMES WILSON and nine students from the Irish Agricultural Department, Dublin, came. On July 2 a party of about twenty members of the Canterbury Farmers' Club, under the direction of Mr. W. W. BARRY; and on July 4 a party of between forty and fifty teachers connected with the Surrey County Council were conducted round the plots.

NATIONAL DAHLIA SOCIETY.—A meeting of the committee of the above Society will be held at the Horticultural Club, in the Club Room of the Hotel Windsor, Victoria Street, S.W., on Tuesday, July 21, at 2 P.M.

THE MIDLAND CARNATION AND PICOTEE SOCIETY.—The forthcoming exhibition of the Midland Carnation and Picotee Society, owing to the lateness of the season, will be held, as usual, at the Botanical Gardens, Edgbaston, Birmingham, on Thursday and Friday, August 6 and 7.

GINSENG CULTURE.—We cite the following extract in view of the great difficulty experienced by expert cultivators in managing this plant:—"Ginseng plants are most exacting in their requirements. They must have just the right climate, the right soil—and that is very hard to find or make—and they must have the very shadiest of shady locations. A cool, even temperature, and deep, loose wood soil, are essential. It is little evidence of future success to know that Ginseng grows in the woods near where it is proposed to plant a garden. Common garden conditions will not do at all. Nor will a shady place in the woods do very well. Growing under sheds is the best way. The roots are almost sure to be stolen, unless very closely watched. Insecurity is one of the main obstacles to final success. My advice is that nearly every one let the Ginseng business alone, and only plant after the closest study of the subject." H. E. Van Deman, in *Rural New-Yorker*.

THE ANT-POISON CASE.—Considerable interest has been excited in a case where certain manufacturers in Scotland were prosecuted by the Pharmaceutical Society, whose prescribed duty it is to undertake such duties, even at a loss to the Society. The charge was that certain manufacturers, without complying with the terms of the Pharmacy Act, sold a mixture containing a very large quantity of arsenic for the purpose of destroying ants. The manufacturers have now been convicted and fined the maximum penalty; but they have appealed against the

decision, and hence comment on this particular case would be improper. On the general question of the protection of the public from the risk of accidental or malicious poisoning there cannot be two opinions.

SEEDLING PALMS AS TURF.—M. ANDRÉ tells us that at Cannes and Nice and elsewhere along the Riviera it is becoming the custom to sow beneath the trees seeds of *Phoenix canariensis*. The seeds are sown very thickly, so that the seedlings form a sort of "grass plot" beneath the trees. After a year or two the baby seedlings grow into juvenile Palms with a different shape of leaf not so well adapted for the purpose, and they are then removed, and fresh seeds sown.

APETALOUS KALMIA.—To Mr. ANTHONY WATERER we are indebted for flowers of *Kalmia latifolia*, entirely devoid of petals, but otherwise normal. The stamens are strongly recurved, but there are of course no pockets in which to contain the anthers and keep them out of the way of the stigma. Whether the absence of the corolla is a device to secure close fertilisation, as happens in cleistogamous flowers, we cannot tell, as the flowers were withered when we received them.

STOCK-TAKING: JUNE.—It is pleasant to have the opportunity now and again to nudge the prophets by recording a rise. This month the Trade and Navigation Returns enable us to state the fact that there is an increase in both imports and exports, when compared with the month of June last year. The value of last month's imports was £41,295,550, against £40,665,315—a gain of £630,235. The figures in the following little table show the relations borne by food and drink imports to all others, as also that between duty free and dutiable items:—

IMPORTS.	1902.	1903.	Difference.
	£	£	£
Articles of food and drink—duty free	9,368,756	10,294,043	+835,287
Articles of food & drink—dutiable	8,287,970	7,845,909	-442,061
All other Imports...	23,608,589	23,245,598	+237,009

There is a large falling off in grain and flour, in part compensated by increases in other sections, and the altogether favourable accounts from all over Canada, &c., with respect to the crops no doubt much affecting speculation. Currants, we note, gave way some £23,656, whilst raisins went up £7,688. Having got to fruit, we now give our usual table of fruit, root, and vegetable imports:—

IMPORTS.	1902.	1903.	Difference.
	Cwt.	Cwt.	Cwt.
Fruits, raw—			
Apples	35,749	41,125	+5,376
Apricots and Peaches	2,546	1,471	-1,075
Cherries	59,501	51,790	-7,711
Currants	3,027	5,465	+2,438
Gooseberries	11,427	14,862	+3,435
Grapes	1,138	1,406	+270
Pears	56	606	+550
Plums	998	519	-479
Strawberries	22,022	25,695	+3,673
Unenumerated	4,954	10,450	+5,496
Vegetables, raw—			
Onionsbush.	165,558	351,938	+186,380
Potatoescwt.	1,536,143	1,510,589	-25,554
Tomatoes	136,262	146,895	+10,633
Vegetables, raw, unenumerated ...value	£47,874	£29,615	-£8,259

Respecting the foreign Plum crop, we receive information from the Bordeaux district that there is every sign of failure, inaugurated by the severe frost in April last; the same influence has been at work in Bosnia, where an average Plum crop

was anticipated a few weeks since. It is satisfactory to note that from most parts of Canada the fruit prospects are excellent, both for Apples, Pears, stone and small fruit of all kinds. The reader will have learnt since our last report that the little arrangement in Greek Currants has been upset by the intervention of Great Britain and other great Powers doing business in that part of the globe and having commercial treaties with the Greek Government. They objected to the intervention of syndicates, and the matter has been allowed to drop by Government and syndicate. This is as it should be. Whilst Oranges and Lemons are waxing unhealthy in appearance, it may be interesting to take brief stock of the last crops in Italy, furnished from a reliable source. The number of fruits in the last crop was 4,900,000,000—an increase over the previous year of 425,000,000, and of some 370,000,000 over the average crop. The value of the wood and timber imported last month was some £2,738,302 against £2,537,708 for June in last year, an increase of about £200,594. The value of the imports for the past six months is placed at £260,529,889, against £262,740,088 for the same period last year—a decrease of £2,210,199. And now a few words respecting the

EXPORTS

for the month of June. The value is placed at £22,271,960, compared with £21,252,383 for June, 1902—an increase of £1,019,577. It is stated that the purchasing capacity of a nation of workers is the value of its exports; the figures we are in the habit of quoting here is proof for the value of the statement, and that so far we are on the right purchasing track is vouchsafed by the record of the six months' value—namely, £142,522,625, against £135,375,574 for June, 1902—an increase of some £7,147,051.

VARIEGATED MAPLE.—Mr. REID, of Elgin, sends us leaves of a beautiful form of the Norway Maple. The long leaf-stalks are of reddish colour; the roundish leaves are cordate at the base, palmately divided nearly midway down into five broadly lanceolate entire or sometimes slightly lacinate lobes. So far there is little or nothing to separate this from the type; but when we come to the colour of the leaves it is a very different matter, the whole of the disc of the leaf being green, with a very deep edging of white. The variegation is almost entirely marginal, and varies in depth in different leaves. It reminds us of the variegated *Negundo*; but this has apparently the advantage of greater robustness, and does not appear likely to burn. The variety was sent out a few years since by Messrs. DRUMMOND, of Stirling.

"THE BOOK OF THE HONEY BEE."—By CHARLES HARRISON. (JOHN LANE: The Bodley Head, London and New York.) If the modern bee-keeper fails, it is not for want of good instruction. Much is being done nowadays to encourage his old and useful industry; personal teaching from experts is easily obtained, and there are many books on the subject. Those thinking of starting bee-keeping will do well to have a few lessons from a professional, but will still not be able to dispense with a reliable handbook. From the *Book of the Honey Bee* they can learn as much as is required of the general habits and customs of bees, and will get some idea of the care that they require. For reference, also, the book should be useful to the experienced bee-keepers. The chapter on the Sources of Honey mentions the plants that yield most to the bees, and this and many other pages are well illustrated. The pictures of bee life that are reproduced from photographs are especially interesting. A bee-hive is a charming and often a profitable addition to any garden wherein room can be found for it and the comparatively small amount of care can be spent upon it.

PUBLICATIONS RECEIVED.—*The Century Book of Gardening*, part x., includes articles on Exhibition-Roses, by Edward Mawley; Flower Gardening in the Grass, and The Greenhouse and its Flowers.—*The Wide World Magazine*, July. Full of wonderful tales of adventure and of more ordinary travel, and including an illustrated article on the Narcissus Festival at Montreux.—*Report of the Department of Agriculture and Immigration (Manitoba) for year ending December 31, 1902.* "This year will long be remembered as the most prosperous year experienced in the history of the province of Manitoba." A bountiful harvest was safely garnered and sold at remunerative prices, and there is increased activity in all business.—*Notes on the Natural History, &c., of Western Australia*, being extracts from the W. A. Year-book for 1900-01, by Malcolm A. Fraser. A republication, in a separate volume, of interesting scientific papers by specialists, dealing with such characteristics of the country as its geography, geology, climate, flora, fauna, &c. The paper on the Vegetation of Western Australia is by the capable hand of Mr. A. Morrison, Government Botanist; and there is also a list of extra-tropic Western Australian plants by the late Baron von Mueller, revised and augmented by Mr. Morrison.—*Annual Administration Report of the Forest Department of the Madras Presidency*, for the twelve months ending June 30, 1902. "The record of the year's work is satisfactory and creditable to the Department."—*Bulletin de la Société Française d'Horticulture de Londres*, 1902. This has a frontispiece-portrait and appreciative notice of the late Mr. C. Maries; reports of the society's meetings; various papers dealing with horticultural subjects, notably one on *Nepenthes*, by Ulrich Guilloud, that is accompanied by several illustrations.—*Spraying Crops*, by C. M. Weed (New York Orange Judd Co.).—*De la conservation des Fruits*, L. Loiseau (81, Rue de Grenelle, Paris).—*Les Plantes des Montagnes* (G. Mayne, same address).

HOME CORRESPONDENCE.

THE WEATHER FOR JUNE: A CONTRAST.—The difference in the rainfall for June in the Thames Valley and other southern districts, and that of the northern portion of the county of Staffordshire, is certainly very remarkable, for whereas at Isleworth $6\frac{1}{2}$ inches of rain fell in a week, we here at Rolleston only registered 1.13 inch for the whole month. June was a very trying month for vegetation in general, as for the first three weeks the weather was cold and gloomy, and for fourteen consecutive days the winds blew from the east, changing to the westward on the morning of the 21st, and bringing 7° of frost, which caused havoc with Potatoes and Kidney Beans, cutting them down to the ground, as usual, the warm and low-lying gardens suffering the most. *Geo. Woodgate, Rolleston Hall Gardens, Burton-on-Trent.*

THE UNPRECEDENTED RAIN-STORM OF JUNE.—I now send you the full record of the rainfall for June, which I personally measured twice daily in a standard 8-inch gauge in my garden:—

June 8	0.60
" 9	0.00
" 10	1.65
" 11	0.24
" 12	0.00
" 13	1.80
" 14	1.40
" 15	0.88
" 16	0.78
" 17	0.31
" 18	0.00
" 19	0.82

Total fall in 12 days ... 8.24 ins.

We had no rain whatever on the first seven days of the month, or on the last eleven days, so that the entire fall of 8.24 inches took place in twelve days. I have used the same rain-gauge and measure for the past nine years, and am assured of the accuracy of the record. The heavy fall on June 10 was local in its incidence. *A. Worsley, Isleworth.*

ALYSSUM PYRENAICUM WITH VALERIANA LONGIFLORA are weeds, on the wall looking due north in the late M. Boissier's garden at Valleyres, Switzerland. Anyone wishing seeds of the *Alyssum* gratis may apply to the undersigned.—*William Barbey Boissier, Valleyres, Vaud, Switzerland.*

THE SPOTTING OF THE LEAVES OF CALANTHES.—Mr. Chapman's note on this subject in a recent issue of the *Gardeners' Chronicle*, in regard to the spotting of *Calanthe*-leaves, had

great interest for me. I do not think this is to be attributed to fungus or disease, but chiefly to the plants being placed beneath other plants which come in for much syringing, the water from which runs down the foliage to the pseudo-bulbs, remaining there for a considerable length of time, penetrating the skin, but not the pseudo-bulbs, causing them and the leaves to look unsightly. Calanthes here at the present time are standing on a bench 3 feet high, covered with fine coal. We never syringe the foliage, but damp between the pots with chemical and farm-yard manure-water, in order to check the increase of red-spider. The foliage at the present time has not a spot upon it, and is in a healthy condition. This spot can be caused in the earliest stages of growth if water happens to get in, and I am confident that the spotting of the foliage and of the pseudo-bulbs is sure to present itself afterwards. *Wm. Fulford, Castle Eden Gardens.*

EXCENTRIC RINGS IN TIMBER.—The very vague "tension" hypothesis, last advanced to explain one of the plainest facts in tree-growth, is sadly spoiled by the fact, familiar to gardeners, that trees fixed firmly to walls and trellises, where

only 1½ in. from the side where the branches were suppressed. You will see also by looking at the innermost rings that when the limb was about as thick as a walking-stick, the pith ring was near the centre, but got left as the branches extended on one side. The section was cut off close to the soil, where there was no tension, the stump being rigid. Unfortunately, also, for the latest and much-elaborated "tension" theory, the broad rings are on the wrong side, and on the opposite side to those on "H. J. C.'s" example. No doubt the Hazel limb pushed straight up from the stool at first, as the Hazel almost invariably does, but leant over to the right side as branches were produced. It grew, when cut, at about an angle of 45°, and the broader rings are on the under side. *J. Simpson.*

—The subject of the formation of excentric rings, discussed by A. C. Forbes, has attracted my attention since 1865, when I spent some time on the site of a plantation that had been cut down near Festiniog, in Wales. Observing the rings, I thought the growth would be greatest on the sunny side, but found it depended much more on the nearness of other

hedge. The pith of the Oak is above and outside the heart, showing that heart is formed with reference to the outside of the tree. A Scotch Pine branch had grown horizontally, and was cut off out of the way of a telegraph wire on a friend's estate. As it showed great excentricity, I got a section of it. Perhaps *Pinus radiata* (*insignis*), from its rapid growth, shows excentricity of growth more than most trees. There the relation of excentricity to position is constant in my tree. Branches below the horizontal show the greatest; one at an angle of 45° did not show half the excentricity of horizontal ones. I have an interesting tracing of a large branch below the horizontal, cut off on April 17, 1874. The turpentine that exuded marked the paper. The same paper was traced April 15, 1889, and I can make another tracing now. Anyone looking up at *P. insignis* branches will notice that the greater growth on the lower side of the branches is clearly shown by the bark opening and showing red in the cracks. *Henry Rogers.* [The tracings show in succession the irregularly concentric rings. *Ed.*]

GERMINATION OF DAVIDIA.—I should like to add to the note on this subject which appeared

FIG. 11.—EXCENTRIC RINGS IN TIMBER.

They are never moved by wind, weight, or anything else, behave just the same as the Oaks before described by me. They push their branches out to the light and lay on wood on the same side, the descending sap-stream taking the nearest road to the root, and leaving its mark behind in the rings. If any of your readers would like to apply the theory about the "stretching and turning force on the cells of the dividing cambium layer," where all the hypothetical conditions described are absent, and adapt their "fancies" to facts, I can procure them ample opportunities on a large scale. Another difficulty in the "tension" theory is that the "excentricity" does not always correspond with the line of tension, and is not found only at the junction with the trunk, but extends along the limb to the source of origin. Herewith I send you a neat illustration of what I say, in the shape of a 5-inch section of Hazel—an unusual size. The bush grew at the margin of a wood, where the branches were suppressed by the trees on one side, but grew freely out to the open sunny side, which I have indicated by a mark on the bark, and where you can both see and feel the bulges caused by the broader rings. On this side the pith-ring is fully 3 ins. from the side, and

trees to the one observed. When two trees of about equal size are near each other, there are no large roots between them, consequently the rings are small on the side towards another tree. I sent specimens illustrating excentricity of growth to the Edinburgh Forestry Exhibition in 1887. Two sections were shown of a Pinaster trunk that had lain on the ground in the early years of its growth, but in course of time grew upright, and had most branches near the top on the opposite side to its greatest excentricity of rings. Of the two sections with the same orientation one has the greatest thickness of rings on the one side, the other on the opposite. A section of a branch that had been cut off from a Turkey Oak-tree puzzled me; the inner rings were largest on the lower side, the outer rings on the upper. On searching we found a piece that had been cut off. This showed that a branch had been cut off some years before the tree was felled, outside the "swell" where the branch joins the tree. The wound had partly healed over, and the sap was interrupted in its descent down the trunk of the tree, causing a greater deposit of wood on the upper side. I have sections of Ash and English Oak quite as excentric as those of the Fir. I believe they were fence trees, that grew out of the side of a

in the *Gardeners' Chronicle* for July 4, p. 12, that the material examined was obligingly supplied by Messrs. James Veitch & Sons, and that it is preserved at Kew. *W. Botting Hemsley.*

PEA AUTOCRAT.—Having grown this variety for some years past, I can fully endorse all that Mr. Markham wrote on p. 399, vol. xxxiii. It is of the type of the old Ne Plus Ultra, but has shorter haulm. It is an excellent cropper, and of good flavour when cooked. In this damp cold district, we have to make our last sowing at the end of May. With this sowing I also include Ne plus Ultra, for should the autumn keep open and mild longer than usual, we are enabled to gather from this latter variety later than from Autocrat. I have gathered Ne plus Ultra as late as Nov. 8, when living in the Midlands. *E. Ward, Longford Hall, Manchester.*

EREMURUS WAREI.—When I wrote on p. 381, vol. xxxiii, of *Gard. Chron.*, "it is doubtful if the true plant is now in cultivation," I intended the passage to read "in general cultivation." I was quite aware of the existence of some flowering examples, also that quite a number of plants of this species were originally

distributed. The Eremuri as a race are very tenacious of existence. E. Warei is one of the hardiest of the whole race, and worth some care to retain it as true as possible to the type. M. Max Leichtlin is very fortunate in possessing specimens of the true plant—i.e., the one with the bright citron-yellow flowers. These, indeed, are worth growing apart, as this species appears extremely variable naturally, or readily cross-fertilised. This is so much so that even to-day some of the examples bearing the above name may be of one of the shades referred to by Max Leichtlin, instead of the fine yellow colour of the original. E. Jenkins.

IMPORTED FRUIT.—A not very wise suggestion has been made by a correspondent of the Colonial Secretary, that import duties should be levied on American Apples, of which such large quantities are usually imported into this country during the winter months. We shall have to admit this season a very poor crop indeed of these important fruits; and with the certainty of great scarcity at home, quite enough of itself to prove to myriads of fruit-growers, dealers, and consumers a great calamity, it is coolly proposed to make that scarcity all the greater, and the cost of Apples to consumers almost prohibitive, by taxing the fruit the Americans so abundantly send us when they have good crops. This correspondent ignores the great additional value given to American Apples by the exceeding care taken in grading and packing the fruits, features we at home still so commonly ignore, and on which defects it is proposed to put a premium. Let us hope that political wisdom will suffice to save us from so great an act of folly. A.

POA ANNUA.—It has been stated several times in your columns recently that this species of grass is obtainable from seeds. As one who knows something of the grasses of commerce, I say this is incorrect. The plant is such a common one that no one takes the trouble to save it, not even the Germans. Some seed firms say they can offer it, probably because they are told so by the wholesale merchant from whom they obtain their supplies; but when one procures a sample it is found on examination to be either *Poa pratensis* (Kentucky Blue Grass), or *Poa compressa* (Canada Blue Grass). The latter perhaps comes nearest to it, nevertheless it is not *Poa annua*. It certainly looks nice in the spring, when full of young spears, but is one of the first soft-leaved grasses to lose its colour on a thin soil during hot dry weather, and under the influence of the mower it often becomes tufty instead of turf. On a heavy unkind soil in a smoky neighbourhood there is no other grass that succeeds so well, but it can never become popular for lawns in the sweet country air. It seeds freely upon light gravelly soil, and seed can be easily collected. Sparrows are very fond of the seed, which is dropped about in their excrement, and in this manner the plant becomes a pest in gardens. Donald McDonald

EXHIBITION VEGETABLES.—The comparative lack of fruit and the entire absence of vegetables at the recent Holland House show was productive of much disappointment to many visitors who naturally expected to see at a great metropolitan show these most important of all garden products well represented. It is interesting to read that at York on the preceding day there was considerable competition with both fruit and vegetables, leading gardeners being specially named in connection therewith. It does seem a pity that with so big a show, visited by thousands of gardeners and possessors of gardens, they should find plants and flowers everywhere and but little else. Yet I must not forget there was one large tent devoted specially to those wondrously varied and marvellously capable things called horticultural sundries, things in which some persons took interest no doubt, but not many relatively, and generally these sundries did not fill the void left by the absence of fruit and vegetables. It is because of this void and of the disappointment caused that I venture to urge on gardeners and all others interested in vegetable culture that a big effort be made to produce a really great and attractive display of these indispensable productions at Chiswick on September 29 next. The three requirements of a first-class vegetable exhibition

are—plenty of material, fine quality, and artistic arrangement or setting up. Given these things, exhibitors need not fear competition in the shape of attraction with plants, flowers, or even fruit. Excepting Roses, flowers which seemed to enjoy the special favour of the visitors, nothing else at Holland Park got special encouragement in the shape of prizes. Could prizes another year be given to vegetables, then the following year to fruit, and back again to flowers, very taking features would result, and a London show might then display what was comprehensive garden produce. A. D.

PRIMULA SIKKIMENSIS.—I can endorse all that Mr. Elwes says about this Primrose being impatient of sunshine. The soil of my garden is not dry, but exposure to hot sun at flowering time has often caused this plant to wither so as entirely to spoil the flower, and even to kill the plant. Planted in peat soil out of the sunshine, this Primrose does extremely well here, and I grow it from seed by the hundred; but each plant seldom lasts more than three or four years. I find many Himalayan plants equally liable to be damaged by sunshine; I may mention *Primula capitata*, *Meconopsis Wallichii* and *nepalensis*, *Cyananthus lobatus*, and *Geranium Wallichianum*. The reason is, no doubt, that, as Mr. Elwes says, they live in their own home in an atmosphere nearly always saturated, so that there is little or no evaporation. My long experiences of trying to grow mountain plants has convinced me that this one factor, evaporation, causes more failures with them in English gardens than any other; and the wetter the soil the more mischief it does to the flowers and plants. C. Wolley Dod, Edge Hall, Malpas.

—The handsome Sikkim Cowslip has been referred to by several correspondents; but I think no writer has given a hint of the best way to deal with the plant in British gardens. The species is said in its native Himalayan mountain home to inhabit wet and boggy places at an altitude varying from 12,000 to 16,000 feet, covering vast areas with its drooping yellow fragrant flowers. This moisture-loving character is an item ever to be borne in mind by those who cultivate it, and so far as my experience goes the plant has a decided preference for a spot that is moisture-laden, but needs liberal drainage. The finest groups I have grown have been so situated that the strong roots could reach the water in the season of growth. The water supply is best if under control. The best general way of dealing with the plant where bog beds or large flowering groups are required is to treat it as a biennial, raising seedlings each year, and growing them quickly for a few weeks prior to planting them out. The value of these seedlings is in their greater vigour. Fresh seeds are desirable. E. Jenkins.

ROSE MILDEW AND "VELTHA."—Having experienced during the past season a complete immunity from mildew amongst pot and other Roses under glass, which is such a fortunate circumstance, especially as mildew and other diseases were generally very prevalent in this part, I am induced to inquire as to the cause of their absence. I have taken no special measures against the pest this year, but last year the plants were treated with "Veltha," the results of which, however, I am bound to confess did not come up to my expectations at the time. May the absence of mildew this year be ascribed to its use last season? I am inclined to think such is the case. That its effect on plants is of a lasting nature I have had positive proof in the case of some *Hydrangeas* which were potted in soil containing "Veltha" last year, the flowers of which have a bluish tint this season. R. W. Dean, gr., Wainsford, Lynton, Hants.

PLANT PORTRAITS.

APPLE TRANSPARENTE DE CRONCELLE. *Bulletins d'Arboriculture*, &c.—A large fruit, pale yellow. The trees are very hardy.

SOPHRO-CATLEYA NYDIA. *Le Jardin*, June 20.

LAW NOTES.

IMPORTANT POINTS IN FRUIT EXPOSURE IN MARKETS.

At Brentford Police Court recently, Walter Vaux, wholesale orange merchant, of Liverpool and Kew Bridge Market, and elsewhere, was summoned by the Brentford Urban District Council for having unlawfully exposed for sale in Kew Bridge Market Oranges which were unfit for the food of man.

Mr. S. Woodbridge, clerk to the Brentford District Council, prosecuted; and the Defendant appeared by his local foreman.

Defendant's manager said the case was not exposed for sale.

The Chairman said that there was a wider point, and one that he thought should be taken as being of great importance to the wholesale fruit trade. The fruit was exposed; but was it for the food of man within the terms of the statute? The Defendant was a wholesale seller, and as such he did not sell for the consumption of man *per se* [directly. Ed.]. He sold to the retailer, who sold for consumption by man. Moreover, the defendant did not know of his own knowledge that the buyer would use the Oranges for the food of man.

Defendant's manager said that a rebate was always made for had Oranges.

After hearing further arguments by Mr. Woodbridge, the Chairman said that as the defendant had not taken the trouble to appear, or thought fit to avail himself by the opportunities open to him, it was not for the Bench to stand in his shoes. He has practically let judgment go against him by default, and he will have to pay a fine of £10 and costs.

THE APIARY.

The Week's Work.—Honey is now coming in very rapidly and of good colour, particularly in districts where Sainfoin is grown, and fresh sections should take the place of full ones that are removed. Some bee-keepers prefer taking out the sections singly, instead of using the bee-escape. When this is done an empty section should be put back as soon as the full one is taken out, because they will be found to fit better, particularly where zinc dividers are used, as they sometimes get bent in the operation; another good reason is that the bees will be kept under better control than if the sections are all taken out at one time. Young swarms have been doing very well, and they should be supered, for even in one week they will be found to have filled up ten frames; and they should be able to fill a crate of twenty-one sections in a week if properly placed on and well wrapped up. Care should be taken that the crate is wrapped up at the sides, front, and end to prevent the bees from working out, as this not only annoys the bees in being smoked back, but is a waste of valuable time. Do not leave honey about the apiary, but remove it as soon as the bees are clear of it, otherwise they will mark it and render it unfit for sale. In swarming, if the bees cannot be kept under control, and a great number of stocks are kept, put a little piece of queen excluder zinc over the entrance for a few days; the bees will then settle down, and the zinc may be removed. In taking off sections where no queen excluder is used in the hive, a good look-out should be kept that the queen is not taken out, or great loss will result. *Expert.*

TEA-PLANTING IN NATAL.—It appears from reliable statistics recently to hand that there are now in Natal some 4,000 acres under Tea-planting; and from this, in the last season, some 1,600,000 lb. weight were gathered. The area planted three years ago will be picked this year, when it is estimated that the crop will yield 2,000,000 lb. The demand for Natal Tea is gradually increasing, and there is room for an increased acreage provided the necessary labour is obtainable.

BICOLOR NECTARINE.

To Mr. Bennett, of Ashford Gardens, Cobham, we were indebted for the Nectarine represented in fig. 12. It was an Early Rivers for about two-thirds of its surface, the remaining portion being of a totally different character, ivory-white without any tinge of red in it. The appearance may be due to the dissociation of hybrid characters, or to a reversion by "atavism" to the original character.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 7.—The usual fortnightly meeting of the Committees took place on Tuesday at the Drill Hall, Buckingham Gate, Westminster. In comparison with the displays that have been made in the earlier part of the year, the show was much less extensive, so that the building was not more than half filled. It was obvious that the influence of the holiday season is already felt, and this was apparent also in the lessened number of visitors. At no time during the day was there any crush.

THE FLORAL COMMITTEE recommended Awards of Merit to *Campanula peregrina*, *Nephrolepis cordifolia crispata congesta*, and two varieties of border Carnations. The displays before this Committee included grand groups and collections of Carnations, *Codiaeums*, and the usual groups of hardy flowers.

Orchids were much fewer than usual, and the Orchid Committee made no award to a novelty, but only three medals in respect of groups.

The principal exhibit before the FRUIT AND VEGETABLE COMMITTEE was a collection of Queen Pines from Lord LLANGATTOCK. An Award of Merit was recommended to a seedling Melon named after President Loubet.

In the afternoon a large number of new Fellows was elected; and Miss Armitage read a paper on Irises. A further paper, contributed by Mr. Caparne, Guernsey, upon some intermediate Irises he has raised, was not read, but it will be published in the Society's *Journal*.

Floral Committee.

Present: H. B. MAY, Esq., in the Chair; and Messrs. Chas. T. Druery, Geo. Nicholson, John Green, J. F. McLeod, Jas. Hudson, Jno. Jennings, W. Howe, G. Reuthe, Chas. Dixon, H. J. Cutbush, Geo. Gordon, H. J. Jones, R. W. Wallace, C. E. Pearson, Chas. E. Shea, W. P. Thomson, E. H. Jenkins, and Ames Perry.

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, London, showed a grand group of *Codiaeums* (Crotons), in which some of the specimens were elevated on stands over a groundwork of Ferns. The collection was extremely representative, there being 120 varieties included. Some of the best of these were Warrenii, Mortefontaineensis, Comte de Germiny, Elysian, superbus, Albert Truffaut, a broad-leaved variety, colour green and pale yellow, the young leaves being nearly all yellow; Newmanni, Princess Waldeck, exceedingly bright, many of the leaves being wholly of gold colour; undulatus, musaicus, &c. The specimens varied in height from 1 foot to 4 feet (Silver-gilt Flora Medal).

A very handsome group of Carnations and Cannas was shown by Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea. The group covered about 120 square feet, and was composed of plants exhibiting excellent cultivation. The Carnations, though they bore grand blooms, were just as remarkable for their healthy "grass." The varieties represented were those of the Souvenir de la Malmaison type, of which there are very few that were not included. In addition to these there were two baskets of plants of the variety William Robinson, a tree variety of rosy-crimson colour. A selection of the best Cannas, in bloom, was also good (Silver-gilt Flora Medal). Messrs. JAS. VEITCH & SONS also showed *Escallonia langleyensis* (a hybrid from E. Philippiana and E. macrantha), *Cytisus schipkaensis*, *Stuartia pseudo-camellia*, and *Cytisus nigricans*. Messrs. JAS. VEITCH & SONS had a large number of Sweet Peas in pots, in fourteen varieties. The plants were trained in globular fashion around two wire rings 15 inches across; the centre was thus kept quite free. The method is one that is very suitable to the health of the plants, and is neat in appearance. Also a group of plants of *Campanula peregrina* in pots. This species is noticed elsewhere (Silver Flora Medal).

Messrs. W. CUTBUSH & SON, Highgate Nurseries, London, N., exhibited a fine lot of cut flowers of varieties of border and Souvenir de la Malmaison Carnations. The varieties of Souvenir de la Malmaison included all the new choice varieties, and there were extra good flowers of Monk, a bright-red late flowering variety; Cecilia was capital, and amongst a large number of seedling border varieties were two named Shiela and Lady Wolverton, that were given awards at the Holland House show. Two others were given awards on Tuesday.

Mr. JAS. DOUGLAS, Edenside Nurseries, Great Bookham, exhibited cut flowers of new varieties of Carnations. Thora is a nearly white, Souvenir de la Malmaison, Albion, pink; Mercia, deep reddish-pink; Lady Grimston, splashed pink and white; Calypso, white or blush-pink. Amongst border varieties, The Dawn has bright red flowers, passing to rose colour; Abbot is a yellow-ground edged with purple; and Lord Napier a yellow-ground very slightly edged with rose; Horea has a yellow-ground with unusually deep crimson edging and markings, &c.

Messrs. JNO. PEED & SON, West Nerwood, London, S.E., exhibited a group of Carnations in pots, the varieties being chiefly of the Souvenir de la Malmaison type (Silver Banksian Medal).

FIG. 12.—A BICOLOR NECTARINE.

Messrs. J. CHEAL & SONS, Lowfield Nurseries, near Crawley, Sussex, exhibited about sixty bunches of Sweet Peas, in which all the leading varieties could be seen.

Notwithstanding the Rose shows that have been held, Messrs. B. R. CANT & SONS, of The Old Nurseries, Colchester, exhibited a number of new varieties of Roses in bunches, including the popular Blush Rambler.

Messrs. THOS. S. WARE, Ltd., Feltham, Middlesex, exhibited a large collection of hardy flowers, including apparently most of the species now in bloom. The same firm occupied an equal amount of space with a group of Delphinium flowers of numerous varieties. Amongst these were some excellent forms of rich purple and blue-flowered varieties. Miss Gladys Batchelor is very large and double, the outer segments being blue, and the inner ones purple, with a white or cream coloured centre; Elsie Reid is a very pale blue variety; Nora Hollis, cream-coloured, with a green spot on the end of each segment; Lorna Doone is one in which mauve colour predominates. *Sarracenia flava* and *Drummondii*, several species of Lilies, and a fine panful of the pretty little *Crassula Cooperi alba*, were included in the exhibit (Silver Banksian Medal).

Mr. M. PRITCHARD, of Christchurch Nurseries, Hants, exhibited an excellent group of valuable and choice hardy flowers, all of which were represented by well-cultivated examples. Very showy were the large bunches of *Monarda didyma*, *Astragalus aurantiaca*, &c. Mr. PRITCHARD also showed flowers of varieties of Iris Kämpferi, and of a variety of *Spirea aruncus* named Koettli, having curiously lacinated foliage; and *Cimicifuga americana* in flower (Silver Banksian Medal).

Ioula glandulosa fimbriata, shown by Lord ALDENHAM, Aldenham House, Elstree (gr., Mr. E. Beckett), had flowers in which the segments were forked, the appearance being quite distinct from the ordinary type.

Mr. E. POTTEN, Camden Nurseries, Cranbrook, Kent, had a collection of hardy flowers; also Rose Schneewittchen, with an abundance of semi-double white flowers upon plants less than 1 foot high.

Messrs. BARR & SONS, King Street, Covent Garden, London, W.C., showed a quantity of blooms of *Gladiolus Colvillei* varieties, also varieties of Iris Kämpferi, of which Nilta and Her Majesty were very pretty. We noticed *Lilium Humboldtii magnificum*, the small but striking L. Grayi, colour crimson with intense spots, &c.

Mr. AMOS PERRY, the Hardy Plant Farm, Winchmore Hill, had a bright exhibit, in which the rich golden yellow coloured flowers of Iris juncea, and the reddish-pink *Phlox ovata caroliniana* were conspicuously showy. *Oenothera frutescens major*, one of the best and freest flowering species; *O. Youngi flore plena*, *Campanula latifolia*, *Ostrowskia magnifica*, and Corsair, a very deep blue flowered Delphinium, were noticed. Flowers of hardy Nymphs in trays of water made an attractive edging to this gay group (Silver Banksian Medal).

Some very beautiful Shirley Poppies were shown by the Rev. W. WILKS, M.A., Vicar of Shirley, to whose care horticulturists are indebted for the charming strain he first distributed and has subsequently improved by continuous selection. The flowers were intended to show the gradual increase of yellow, pink, and other variations of colour and shade the strain has acquired.

Messrs. WALLACE & Co., Kilnfield Gardens, Colchester, exhibited an unusually large collection of hardy flowers. There were many charming varieties of the Japanese Iris (*I. Kämpferi*); *Oenothera Fraseri* had abundant yellow flowers, and the same colour was afforded by vigorous flowers of Iris Monnierii. *Lilium pardalinum californicum*, L. Henryi, *Eremurus Bungei* (yellow), *Eryngium alpinum*, *Calochortus*, *Thalictrum flavescens glaucum* (a very strong-growing species with yellow flowers), *Heuchera micrantha rosea*, &c., were all shown well (Silver-gilt Flora Medal).

Verbena hybrida "Miss Willmott" has become known very commonly in a short space of time for its distinctive colour and good habit as a pot plant, as well as for planting in beds. On Tuesday, Miss WILLMOTT, of Warley Place, Essex, exhibited another variety named Warley, which is rich rosy-red in colour, and has apparently the same habit as the other variety (Silver Banksian Medal).

Mr. R. ANKER, agent for Franz de Laet, Contich, again exhibited a collection of small Cactuses.

Several specialities and implements for the garden were shown, including tubs for Oranges, Camellias, and similar plants, by Messrs. CHAMPION & Co., City Road, London, E.C.; Pattison's lawn boot for horses; a convenient wire-holder for labels, known as the "Sanlac" holder; Beetecute, a powder for destroying cecroaches and other insect pests; and Junofloris, a liquid for assisting the preservation of cut flowers in a fresh condition.

Plumeria bicolor is a very old Apocynaceous plant from tropical America. It is a stove shrub, with green oblong lanceolate leaves, and has white flowers with a yellow throat. A plant about 2 feet high carrying flowers was shown by Sir WETMAN PEARSON, Paddockhurst (gr., Mr. A. B. Wadds).

Awards.

Border Carnation, *Merlin*.—A large, rich yellow-ground flower, with reddish-crimson edging. The flowers have excellent petals, and a non-splitting calyx. Shown by Messrs. W. CUTBUSH & SON (Award of Merit).

Border Carnation, *Diadem*.—A yellow ground flower having a rose edging pale in colour but extending deep into the petals. The form is very good, and the calyx sufficiently large as to allow of the petals opening freely. Shown by Messrs. W. CUTBUSH & SON (Award of Merit).

Campanula peregrina.—This is an old species, having been introduced from Mount Lebanon more than a century ago. The flowers are sessile and in colour violet or pale purple; they are 1½ in. across, and funnel shaped. The rough leaves are obovate and ovate, and about 5 inches long. The habit is good, as the plants produce branches from the base and form well-furnished specimens. Shown by Messrs. JAS. VEITCH & SONS, Ltd. (Award of Merit).

Nephrolepis cordifolia crispata congesta.—This is an exceedingly dwarf and crispate form, not more than 5 inches high as shown. The fronds are densely congested, and the variety is an interesting novelty, there being so few dwarf forms in this genus. The variety was first shown at the meeting on June 9. From Mr. H. B. May, Edmonton (Award of Merit).

Orchid Committee.

Present: Henry Little, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. T. Pitt, W. Boxall, M. Gleeson, W. H. Young, E. Hill, H. A. Tracy, W. H. White, and W. A. Bilbey.

Compared with the recent great events at the Temple and Holland House, there was a great falling off in the number of Orchids exhibited, and no award was made by the Committee other than Medals for groups staged.

Sir FREDERICK WIGAN, Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed a fine collection of cut flowers of *Sobralias*, and two forms of *Cypripedium Godefroyae leucochellum*, the one with a white, and the other a pale yellow ground colour. The *Sobralias* included S. Wiganie, one of the largest and finest flowered species, with white sepals and petals shaded with yellow and lavender colour; and very broad lip with chrome-yellow throat and light rose front lobe, on which the white veining makes an attractive tracery; S. × *Veitchii aurea*, with bright yellow flowers; S. *xantholeuca*, also yellow; and the rose-purple S. *macrantha* (Silver Banksian Medal).

Messrs. SANDER & SONS, St. Albans, secured a Silver-gilt Flora Medal for a very fine group, in which the numerous beautiful forms of *Lælio-Cattleya* × *Martineti*, for some of which they secured awards at Holland House, were the leading feature. Of the many varieties shown, scarcely two were alike. The finest were of the yellow and bronze-petalled type, and the best of them L. C. × *Martineti splendida*, with rose-tinted, yellow sepals and petals, and rich claret-purple lip, lighter towards the margin, and which was slightly better than the one which secured a First-class Certificate at Holland House. Two fine specimens of this hybrid had a dozen flowers each. L. C. × *Gladiator* (L. *tenebrosa* × C. *Mendeli*), a pretty hybrid first shown by Messrs. Charlesworth at York several years ago; the sepals and petals of which are cream-white beautifully marked with rose on the outer halves; lip cream-white with handsome ruby-purple front. Messrs. SANDER'S group also included the fine *Cattleya* × *preciosa inversa*, C. *Mossiae Reineckiana*, C. M. *azurea*, a white flower with delicate lavender hue; *Maxillaria Sanderiana*, *Acropera Loddigesii*, *Cymbidium tigrinum*, *Stanhopea oculata*, *Oncidium macranthum*, the singular *Angraecum pertusum*, *Miltonia vexillaria superba*, with fine crimson blotch on the labellum; and a number of showy hybrid *Lælio Cattleyas*, &c.

REGINALD YOUNG, Esq., Fringilla, Lionet Lane, Sefton Park, Liverpool (gr., Mr. Poyntz), showed a flower of his new *Cypripedium* × *Uitor* (*Lawrenceanum* ♀ *Sanderianum* ♂), and also a photograph of it; but the material was insufficient to meet the rules for Awards. The photograph represented a three-flowered inflorescence, and the flower is a very distinct and handsome hybrid of the C. × *Massaianum* class. The upper sepal is ovate acuminate, pale whitish-green, with a chocolate central band, and five dotted lines of chocolate colour on each side. The arched drooping petals, 6 inches in length, show the undulated characters of C. *Sanderianum* in the portion, which is white slightly tinged with green, and bears dark purple warty spotting, which expands into the rose-tinted acuminate outer half, the apical third of which is unspotted. The lower sepals resemble the upper, but are much narrower, and the labellum and staminode are of a rose-tinted mahogany colour.

The Hon. WALTER ROTHSCHILD, Tring Park (gr., Mr. E. Hill), showed *Lælio-Cattleya* × *Mauve Queen*, Tring Park variety (C. *Warneri* × L. *crispa superba*), the handsome flower of which resembled some of the best forms of L. C. × *callistoglossa*; but the parentage renders it summer flowering. Sepals and petals white delicately tinted with rose; throat of lip bright yellow, front crimson-purple.

Messrs. WILLIAM BULL & SONS, Chelsea, secured a Silver Banksian Medal for a neat collection of the rare, handsome leaved terrestrial Orchids commonly known as *Anætochilus*, and which included a fine specimen of the velvety green and bronze-leaved *Dossinia marmorata*; two of the emerald green, gold veined *Macodes petala*; the yellow variegated *Goodyera Rollissonii*, *Anætochilus intermedius*, *Hemaria discolor*, and a more acuminate leaved form of it named *larceolata*.

Fruit and Vegetable Committee.

Present: Geo. Buryard, Esq., Chairman; and Messrs. Jos. Cheal, W. Bates, S. Mortimer, A. Dean, T. Coomber, C. G. A. Nix, Jas. Smith, F. Q. Lane, Geo. Wythes, Jas. H. Veitch, A. H. Pearson, H. Balderson, and H. Eslings.

A collection of eighteen fruits of the Queen Pine-apple from Lord LLANGATTOCK'S garden, The Hendre, Monmouth (gr., Mr. T. Coomber), was awarded a Silver-gilt Knightian Medal. The fruits were splendid specimens of medium weight, and were a further testimonial to Mr. Coomber's skill in treating the Pine. The Hendre is one of the very few establishments in which the cultivation of Pineapples is still practised. He also showed six beautiful fruits of Raymacker Peaches.

Messrs. GEO. BUNYARD & CO., Ltd., Maidstone, exhibited punnets of twelve varieties of Strawberries, including the following: Dr. Hogg, Trafalgar, Goliath, Leader, Monarch, Louis Gautier (white), Waterloo, Sir Joseph Paxton, Trollope's Victoria, President, Royal Sovereign, and Walluff. In these days, when Royal Sovereign is cultivated in so many gardens to the exclusion of most or all other varieties, it is gratifying to see such a collection.

There were as many as five seedling Melons before the Committee for Certificates, but one only was successful in obtaining one. Three varieties were shown by the authorities of the Horticultural College at Swanley.

Messrs. HUGH LOW & CO., Bush Hill Park Nurseries, Enfield, exhibited a tree, in pot, of Fig White Marseilles, carrying a heavy crop of ripe fruits; also Vines in pots of the varieties Syrian and Lady Hastings.

Some excellent specimens of Western Express Pea, with ten and eleven Peas in a pod, were shown by Messrs. VEITCH & SON, 54, High Street, Exeter.

A dish of fruits of the pretty Apple Lady Sudeley were shown from the Horticultural College, Swanley, and were culturally commended.

Mr. GEO. FOWLER, 78, Bank Street, Maidstone, again exhibited his fruit-bottling apparatus, and specimens.

Awards.

Seedling Melon President Loubet.—This is a red-fleshed variety, of moderate size, exceedingly juicy, and possessing rich flavour. The exterior is deep yellow colour, with coarse netting. Shown by F. H. FAWKES Esq., Farnley Hall, Odley, Yorkshire (gr., Mr. J. Snell) (Award of Merit).

The Lecture.

HARDY IRISES.

Miss ARMITAGE, in the afternoon, prefaced a lecture upon hardy Irises by an appreciation of the beautiful forms, colours, and markings of the flowers in this genus. Proceeding to describe their cultivation in England from personal experience, she referred first to the natural habitats of the plants, explaining the local conditions. In respect to the bulbous Irises, it was pointed out that they were subjected to severe sun ripening at home, but frequently in England, as last year, the conditions are wholly different. As a consequence several of the bulbous species, including I. *Bakeriana* and I. *Danfordiæ*, have failed to reappear this year in Miss ARMITAGE'S collection.

Bulbous Irises, said Miss ARMITAGE, should be planted on the south-eastern aspect of the rockery, on the highest level, in full sunshine, a position where heavy rains will not flood and snow will quickly melt away. When the flowers have passed and the bulbs are maturing their growth, let the leaves be tied together to keep them from injuring other plants, but do not cut them off until they are quite yellow. The soil they require is one of light sandy loam and leaf mould, and the bulbs should be planted from 4 inches to 6 inches deep. Miss ARMITAGE described most of the species in this group, including amongst others I. *Ilustris*, I. *ilustrisoides*, I. *Bakeriana*, I. *reticulata*, I. *Danfordiæ*, &c.

The June Irises were next described, including such species as I. *caucasica*, I. *sindjarensis*, I. *persica* and its varieties, &c.

Water Irises, said Miss Armitage, do best by a pond which has an overflow. The plants would not succeed so well on the margins of water that is liable to rise and flood the plants in winter and recede in summer, leaving them standing high and dry in bright weather. If such Irises like their feet in water, said Miss Armitage, they also like to have their heads in sunshine, and excessive shade was therefore injurious. The "Water" Irises include such species as I. *sibirica* and all its varieties, I. *virginica*, I. *longipetala*, I. *longipetala superba*, I. *missouriensis*, I. *graminea*, I. *ochroleuca*, and I. *laevigata* (Kämpferi).

Miss Armitage then proceeded to speak of certain morphological characteristics she had noticed in the pollen of Irises, and in the fragrance. Some had white, others green or slaty-blue or yellow pollen.

The lecturer concluded with some phenological details in regard to the dates when the species come into flower; the principal point about which was the fact that Irises may be had in bloom during eight months of the year.

The lecture was superbly illustrated by a number of coloured drawings of the various species made by Miss ARMITAGE'S sister from plants growing in the garden.

Mr. CAPARNE'S lecture upon Irises, in which reference was made to the intermediate Irises he has raised in Guernsey, was not read, but will be published in the Society's journal. One of these intermediate Irises is illustrated in the Supplement to our present issue, and a full description of the new race was published in the *Gardeners' Chronicle* for November 30, 1901, p. 397.

CHISWICK, JULY 3.—A meeting of the Fruit and Vegetable Committee was held here on the above date. *Present:* Mr. H. Balderson in the chair; Messrs. O. Thomas, J. Cheal, J. Jaques, G. Wythes, J. Smith, H. J. Wright, H. Eslings, G. Kelf, S. Mortimer, and A. Dean. The meeting was called to inspect the Pea trial, which is again this year a very extensive one, but owing to the great cold with the excessive beating rains in June, and the baking heat since, causing the ground to become unduly hardened, the trial does not promise to be so good as was that of last year. Only a few were sufficiently forward for testing, and of these some regarded as satisfactory croppers were cooked and tasted in that condition, as also in a raw state.

The following obtained Awards: Ideal (SUTTON & SONS), 3 feet in height, capital crop, pods well filled, and peas of great excellence, quite of the best character—First-class Certificate Little Marvel (SUTTON & SONS), 20 inches in height, pods small, well filled, and produced in great abundance; The Pilot (HURST & SON), a 6-foot variety, heavy cropper, fine pods, and very superior in quality; and Gleaner (JAS. VEITCH & SON), also a 6-foot Pea, very fine in pod and crop—these obtained Awards of Merit. Pods of a Sugar Pea were also cooked, but were not liked.

Mr. S. MORTIMER, Rowledge, Farnham, presented a Melon named Regina, green flesh, and of the most luscious and richly-flavoured character—Award of Merit.

The Committee framed a resolution inviting the Council to require from all persons sending in Peas for trial henceforth to specify in each case the height and season of maturity, that the varieties may be more effectively grouped for purposes of staging and comparison. The Committee wished that more labour could be furnished in the gardens, so that the hard beaten ground between the Pea-rows could be loosened, then well mulched with manure to help it to retain moisture.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 26.—Members of committee present:—Messrs. Ashworth Duckworth, Cypher, Upjohn, Holmes, Parker, Cowan, Rogers, Keeling, and Williamson.

There was only a small number of entries.

AWARD OF MERIT.

Lælio-Cattleya × *Martineti* var. *flavescens*, to Mr. J. Cypher.

Cattleya Warneri var. *gemma*, to Mr. J. Cypher.
Cattleya Mendeli var. Mrs. H. Shaw, to H. Shaw, Esq.
Oncidium lamelligerum, to T. M. Eccles, Esq.

MEDALS.

For group of Orchids, Silver Medal to W. Duckworth, Esq.

For group of Orchids, Bronze Medal to Mr. J. Cypher.
For group of Orchids, Bronze Medal to J. Leemann, Esq.

VOTES OF THANKS.

For group, to Mr. A. J. Keeling.
For group, to Mr. D. McLeod.

P. W.

DORCHESTER GARDENERS' AMATEUR AND MUTUAL IMPROVEMENT.

ON Thursday afternoon, June 25, this body of horticulturists substituted an excursion to Lord Ilchester's gardens at Abbotsbury for their usual evening meeting. Arriving at the gardens by road conveyance, the party was met by Mr. Benbow, his lordship's head gardener,

and conducted by him through the gardens. Abbotsbury is peculiarly rich in exotic flowering shrubs, Bamboos, Eucalyptus, Himalayan and Sikkim Rhododendrons, in Azaleas, Japanese, Australian, and New Zealand plants; and the visitors were highly delighted with all that they saw, and with the courteous manner in which they had been received.

HANLEY HORTICULTURAL FÊTE.

JULY 1, 2.—The seventh annual summer fete was held in the Park, Hanley, on the above dates, six large tents being provided, and filled with some of the best exhibits ever seen at Hanley. The very good Rose show came as a great surprise, as the incidence of the season had been against the production of good blooms, and there was the exhibition of the National Rose Society in the Temple Gardens on the same day. The opening ceremony was performed by the Countess Torby, who with her husband, the Grand Duke Michael of Russia, are living at Keele Hall. There was as usual a large attendance.

Groups arranged for effect.—The very liberal prizes offered for these by the Executive brought seven groups, all of the pattern with which Messrs. CYPHER have made us familiar; it was required that each should be arranged on a space of 300 square feet. Each followed the square shape. The group arranged by Messrs. CYPHER & SON, Queen's Nurseries, Cheltenham, seemed to be perfect; the artistic arrangement employed was excellent; rich in the extreme. The EXORS. of the late J. H. TURNER, of Derby, were 2nd.; and Mr. J. READ, gr., Bretby Park, 3rd.

Plants.—Groups of Orchids arranged for effect with foliage plants, on a space of 100 feet, were a notable feature. The 1st prize was taken by Mr. J. ROBSON, nurseryman, Altrincham, who had Cattleyas, Cypripediums, Odontoglossums, Dendrobium formosum giganteum, Brassavola Digbyana, &c., charmingly arranged on a raised stage; Messrs. CYPHER & SON were 2nd.

With eight Orchids the Cheltenham firm came in 1st; they had in very good character Cypripedium Curtisii, Epidendrum vitellinum majus, Lælia tenebrosa, L. furfuracea, Cattleya gigas, &c.; Mr. J. ROBSON was 2nd.

The collection of twelve plants, six flowering and six foliage, made a fine feature, Messrs. CYPHER & SON being 1st, and Mr. W. VAUSE 2nd. With six plants in flower Messrs. CYPHER & SON were again 1st.

A class for a group of Malmesbury and other Carnations brought an effective exhibit from Mr. J. ROBSON, mainly consisting of Princess of Wales, with a few of maroon, yellow, and scarlet shades; Mr. P. BLAIR, The Gardens, Trentham, was 2nd, showing large specimens. Fine foliaged plants were shown by Messrs. CYPHER & SON, W. VAUSE, and T. BOULTON. Caladiums were shown in collections of twelve plants, and also table plants.

Cut Flowers.—There were several collections of seventy-two varieties of Roses. Messrs. HARKNESS & Co., Hitchin, taking the 1st prize with fresh, bright flowers; Mr. GEO. MOUNT, nurseryman, Canterbury, was 2nd; and Messrs. G. & W. BURCH, Peterborough, 3rd. With forty-eight varieties, six collections being staged, THE KING'S ACRE NURSERY CO., Hereford, came 1st; Messrs. G. & W. BURCH were 2nd; and Mr. GEO. MOUNT, 3rd. With thirty-six varieties, three blooms of each, Messrs. HARKNESS & Co. were again 1st, and Messrs. G. & W. BURCH were 2nd.

With twelve blooms, distinct, Messrs. JARMAN & Co., Chard, took the 1st prize with well-developed examples of Bessie Brown, Mildred Grant, Frau Karl Druschki, Marquise Litta, &c. Messrs. TOWNSEND & SON, Worcester, were 2nd.

The best twelve blooms of one variety, there being eight competitors, were from the KING'S ACRE CO., who had Lady Mary Fitzwilliam in excellent character. Messrs. TOWNSEND & SON were 2nd, with Bessie Brown.

Garden Roses were shown in bunches; there was a class for eighteen, and also for nine. Messrs. TOWNSEND were 1st in both classes; the KING'S ACRE CO. were 2nd with eighteen bunches, and Messrs. HARKNESS & Co. with nine bunches.

Other cut flowers included very fine collections of hardy perennials, Messrs. HARKNESS & SON, Bedale, taking the 1st prize with superb bunches, including some of the choicest subjects in bloom at the present time. Lilies, Delphiniums, Hemerocallis, &c. Messrs. GIBSON & Co., Bedale, were 2nd.

Floral Decorations made a very fine feature; the best dinner-table arranged with flowers and foliage was set up by Mr. W. VAUSE, pink Sweet Peas and Carnations—simple but very pleasing. Mr. J. C. WATERHOUSE was 2nd.

The best stand of cut flowers came from Messrs. M. JENKINSON & SONS, Newcastle, Staffs.

The best arranged basket of flowers was a superb one from Messrs. PERKINS & SON, of Coventry.

The best bouquet came from Messrs. JENKINSON & SON.

There were three classes for Sweet Peas; in two of

them special prizes were offered for twelve bunches by Messrs. H. ECKFORD and R. SYDENHAM. Mr. W. SHROPSHIRE was the only exhibitor in each class.

Mr. W. MARPLE, Penkridge, was the winner of the 1st prize in the class for twelve bunches, provided by the Executive, though the only exhibitor.

FRUIT.

The best dessert-table, arranged with flowers and foliage, and to include no fewer than fourteen dishes of fruit, was most tastefully set up by Mr. JORDAN, the Gardens, Impney Hall, Droitwich; he had white and black Grapes of excellent quality, Peaches, Nectarines, Figs, &c., tastefully arranged with vases of Ixias and charming foliage. Mr. J. H. GOODACRE came in a close 2nd, following much the same arrangement; and Mr. J. READ, gr., Bretby, was 3rd.

Mr. JORDAN also had the best twelve dishes of fruit, decorated with flowers and foliage, staging Black Hamburg and Muscat of Alexandria Grapes, a Queen Pine apple, Royal George and Thomas Rivers Peaches, Lord Napier and Pineapple Nectarines, two Melons, Figs, Strawberries, &c.; plants of the pink-flowered Chironia ixifera, Eulalia, &c., were used with Orchids and other cut flowers. Mr. PHERSON, The Gardens, Londesborough Park, was 2nd; Mr. J. H. GOODACRE was 3rd.

With six dishes of fruit, Mr. T. BANNERMAN, The Gardens, Blethfield, Rugeley, was 1st; he had well-finished Black Hamburg Grapes, Royal George Peaches, Early Rivers Nectarines, Brown Turkey Figs, Melons, and Strawberries. Mr. J. READ, Bretby Gardens, was 2nd.

The 1st prize for four bunches of Grapes, black and white, was taken by Mr. NICHOLLS, The Gardens, Carlton Towers, York; and Mr. J. READ, 2nd.

With two bunches of Black Hamburg, Mr. J. C. WATERHOUSE was 1st; and with two bunches of any other black Mr. BANNERMAN came 1st with Madresfield Court.

Mr. BANNERMAN also came 1st with two bunches of White Muscats, and for any other white variety, having Foster's Seedling. There were Peaches, Melons, Cherries, Strawberries, and Tomatoes.

Vegetables were shown in several classes, and also in those in which Messrs. SUTTON & SONS, WEBB & SONS, and HEWITT & Co. offered special prizes.

MISCELLANEOUS EXHIBITS

were numerous, and Gold Medals were awarded to Messrs. Blackmore & Langdon, Twerton Nursery, Bath, for double and single Begonias; to Mr. W. H. Child, Acocks Green, Birmingham; and Messrs. Dicksons, Ltd., Chester, for collections of hardy flowers, &c.; and to Mr. John Forbes for Phloxes and Pentstemons in pots.

Silver Medals to Messrs. Harrison & Son, Leicester; Hewitt & Co., Solihull; and Jenkinson & Son, for collections of hardy flowers; to Mr. H. Eckford, Wem, for a collection of the newer forms of Sweet Peas; to Messrs. Jarman & Co., Chard, for plants; and to the Ranelagh Nursery Company, Leamington, for plants. Several lesser awards were also made.

GLOUCESTERSHIRE ROSE.

JULY 7.—Favoured with real summer weather, the Gloucestershire Rose Society held its fifteenth annual exhibition, open to the United Kingdom, on the Spa Cricket Field, Gloucester, on the above date. The season has been a decidedly backward one for Roses, but the last eight or ten days of warm weather, preceded by heavy rains have had a wonderful effect in developing the blooms. The collection of Roses displayed at the Gloucester meeting this year, both in point of quality and in the number of exhibits, compared very favourably with those shown at any previous exhibition of the Society.

The Nurserymen's classes were particularly well represented, and there were no less than four entries for the class for seventy-two varieties: the 1st prize, for which was awarded to Messrs. DICKSON & SONS, Newtownards, Co. Down; Messrs. FRANK CANT & Co., Colchester, being a good 2nd; and Messrs. D. PRIOR & SON, Colchester, 3rd.

In the class for thirty-six varieties, Messrs. JEFFERIES & SONS, Cirencester, took the premier prize; Messrs. TOWNSEND & SON, Worcester, the 2nd; and Mr. THOMAS RIGG, Caversham, Reading, 3rd.

Messrs. DICKSON were again 1st for twenty-four varieties; while in Teas or Noisettes, Mr. GEORGE PRINCE, of Oxford, secured the two 1st prizes.

In the Amateur division, Mr. CONWAY JONES, the veteran local Rose-grower, was 1st for twenty-four varieties, twelve varieties, and six single trusses, and for nine bunches of garden Roses; but had to take 2nd place to Mr. HILL GRAY, of Bath, in the two classes for Teas. The Silver Medal awarded by the Society for the best hybrid perpetual or hybrid Tea was also won by Mr. CONWAY JONES, with a magnificent bloom of Alice Lindsell. The Silver Medal for the best Tea was carried off by Mr. HILL GRAY, with a grand flower of Medea.

The classes for the county and city amateurs were also well filled. The silver cup presented by the Mayor and Corporation of Gloucester, for twelve varieties, was awarded to Mr. J. H. CROXFORD, of Tuffley; and the Silver Rose Bowl offered by the City High Sheriff was won by Mr. T. A. WASHBURN, of Gloucester, late hon. secretary of the Society.

The Cottagers classes attracted a capital lot of entries, the Silver Medal being awarded to Mr. J. B. CLARKE, of Newnham, for a fine exhibit of twelve varieties.

There were nine entries for table decorations, which were most elegant. Two extra prizes were awarded, and the judges were so satisfied with the whole class that they gave each exhibitor a Certificate of Merit.

WOLVERHAMPTON FLORAL FÊTE.

TENTS BLOWN DOWN BY A HURRICANE.

JULY 7, 8, 9.—A most unfortunate disaster befell this annual fixture, as the high wind which prevailed on Monday, the 6th, levelled the whole of the tents to the ground, splintering the poles which formed the main supports; but happily no exhibits had been placed in them. The refreshment and other tents shared a like fate. One or two of the exhibition tents were materially injured, but were repaired during the night. It was not until Tuesday morning that attempts could be made to rear the tents, consequently the judging of the exhibits had to be postponed until quite late; indeed, some of the awards, and especially in the case of the groups, could not be made until 5 P.M. Everything which could be done by the committee to facilitate matters was entered upon with vigour. The company were admitted to the tents at the usual hour, though the work of staging the exhibits was in progress. The weather was gloriously fine, and there was as usual a large attendance.

PLANTS.

When our representative left the ground the group had yet to be judged, and they were in progress of completion, but it appeared that Messrs. CYPHER & SON, Cheltenham, would be again 1st with one of their elaborate arrangements. They were certainly 1st with sixteen stove and greenhouse plants, flowering and fine foliage, having superb Palms and Crotons, and the usual specimen flowering plants. They were also 1st with a collection of Orchids, having fine varieties tastefully set up; and Mr. J. ROBSON, Altrincham, was 2nd. Palms and Ferns were being staged in the form of fine specimens. Collections of twenty plants in pots, at least eight to be in flower, made pleasing groups. Messrs. CYPHER & SON were 1st; Mr. W. FINCH, Coventry, was 2nd; and Mr. Blakeway, gr. to Sir A. MUNTZ, Bt., M.P., 3rd. Collections of twelve plants were also shown.

Collections of flowering plants, to consist of one variety only, made an interesting feature. Mr. H. LOVATT, Bushbury, was placed 1st, with a group of dwarf gush but well-bloomed Cannas; Mr. J. ROBSON being 2nd.

Messrs. BLACKMORE & LANGDON had the best group of Begonias, staging single and double flowered varieties of fine quality.

Roses.—There was an excellent display of Roses; the entries were unusually numerous, but the storms of Monday prevented some from bringing their blooms. There were four collections of seventy-two varieties, Messrs. HARKNESS & Co., Hitchin, taking the 1st prize with some very fine blooms; Messrs. B. R. CANT & SONS, Colchester, with nice, fresh, though a little undersized blooms, 2nd; and Messrs. D. PRIOR & SON Colchester, were 3rd.

With forty-eight varieties, Messrs. HARKNESS & Co. were again 1st; Mr. GEO. MOUNT, Canterbury, was a close 2nd; and Messrs. B. R. CANT & SONS, 3rd.

With eight varieties, three blooms of each, Mr. GEO. MOUNT was placed 1st with some superb blooms, chief among them Bessie Brown, Carollue Kuster, Mrs. J. Laing, Mildred Grant, Mrs. W. J. Grant, Ulrich Brunner, and Frau Karl Druschki. The KING'S ACRE NURSERY CO., Hereford, were 2nd; and Messrs. HARKNESS & SON, 3rd.

With twelve bunches of Roses, shown with foliage as cut from the plants, Mr. GEO. MOUNT was 1st, putting up beautiful blooms on long stems of Captain Hayward, Bessie Brown, Mrs. J. Laing, Ulrich Brunner, Killarney, Mrs. Sharnan Crawford, &c.—an excellent innovation; but the blooms should be on strong stems in order to maintain an erect position. Messrs. GEO. PRINCE & Co., nurserymen, Oxford, were 2nd, setting up bold bunches of garden Roses, such as Crimson Rambler, &c.; and the KING'S ACRE CO., was 3rd.

With twenty-four varieties, single blooms, for exhibitors not showing in the class for seventy-two blooms, Mr. GEO. MOUNT was 1st; Messrs. TOWNSEND & SON, Worcester, were 2nd; and Messrs. PRIOR & SON, 3rd.

The best twelve new Roses of the previous three years were staged by Messrs. B. R. CANT & SONS, who had Lady M. Beauclerk, Muriel Grahame, Apothecary

Hofer, Alice Lindsell, Gladys Harkness, Frau Peter Lambert, Frau Karl Druschki, Madame Jean Dupuy, Edmund Deshay, Perle Van Godesberg, Prince of Bulgaria, &c. Messrs. A. DICKSON & SONS, Newtownards, Belfast, was 2nd; their leading blooms were Muriel Grant, Robert Scott, Lady Battersea, Louise Muller, Edith D'Ombraïn, Aimée Cochet, &c. 3rd, Messrs. HARKNESS & SONS.

The best twelve blooms of one dark variety was a charming lot of Liberty from Mr. GEO. MOUNT; Messrs. D. PRIOR & SON were 2nd, and the KING'S ACRE CO. 3rd, with A. K. Williams.

The best twelve blooms of a light variety were those of Mildred Grant, from Messrs. GEO. PRINCE & CO.; Messrs. TOWNSEND & SON came 2nd with Beattie Brown, and the KING'S ACRE CO. 3rd with the same variety.

The best twelve Tea scented came from Messrs. GEO. PRINCE & CO., who had some very fine ones in Mrs. E. Mawley, Maréchal Niel, White Maman Cochet, Mrs. B. R. Cant, Innocenta Pirola, François Kruger, Muriel Grahame, &c. The KING'S ACRE NURSERY CO. were 2nd, and Messrs. J. TOWNSEND & SON, 3rd.

A delightful class was that for six vases of Sweet Briar Roses in six distinct varieties. The only exhibitors were Messrs. GEO. PRINCE & SON, who had charming bunches of Catherine Seyton, Green Mantle, Flora McIvor, Julia Murray, Amy Robsart, and Lord Penzance.

In the class for a bowl of Roses, arranged with Rose foliage only, and containing not fewer than thirty-six blooms, Messrs. J. TOWNSEND & SONS were 1st, having a tasteful arrangement of Teas, H.P.'s, and Crimson Rambler. Messrs. GEO. PRINCE & SON were 2nd, and Messrs. T. DOBBS & CO., 3rd.

A further pleasing class was for nine vases of Tea Roses, seven blooms in each. Messrs. GEO. PRINCE & SON were again 1st, chief among them being Edith Gifford, Souvenir d'un Ami, Medea, Maman Cochet, Souvenir de S. A. Prince, and Madame de Watteville; Messrs. D. PRIOR & SON were 2nd; and Mr. GEORGE MOUNT, 3rd.

FLORAL DECORATIONS

were represented by bouquets and various arrangements of a pleasing character; tables florally decorated were numerous, and some arranged with much skill. The arrangements in Sweet Peas were very good, Messrs. JONES & SON, Shrewsbury, taking the 1st prize. Good blooms were also shown in the classes in which Messrs. ECKFORD and SYDENHAM provided special prizes.

In the large group of classes following those open to all, many good exhibits of plants, flowers, &c., were arranged. The children made a huge display of arrangements in garden and wild flowers, but they had to arrange them under conditions of great difficulty.

FRUIT

was fairly well shown, the best four bunches of Grapes, one of each variety, was staged by Mr. S. BARKER, The Gardens, Clumber, Worksop, who had Black Hamburg, Foster's Seedling, Madresfield Court, and Buckland Sweetwater. Mr. J. BANNERMAN, The Gardens, Blithfield, Rugeley, was 2nd; he had Muscat of Alexandria in the place of Foster's; Mr. J. DOE, The Gardens, Rufford Abbey, 3rd.

Mr. BARKER had the best two bunches of White in Buckland Sweetwater; Mr. B. ASHTON was 2nd with the same. With two bunches of Black Mr. BARKER came 1st, with excellent Madresfield Court; Mr. DOE was 2nd with the same. There were many Melons, good Peaches, Nectarines, &c.

Mr. DOE was placed 1st with a collection of eight dishes of fruit. He had white and black Muscat Grapes, Dymond and Stirling Castle Peaches, Downton Nectarines, Figs, &c.; Mr. J. H. GOODACRE, The Gardens, Elvaston Castle, was 2nd. He had white Muscat and Black Hamburg Grapes, Royal George and Belle-garde Peaches, Lord Napier Nectarines, Lady Sudcley Apples, &c.

Some good vegetables were shown in the open, special prizes being offered by Messrs. Sutton & Sons, Webb & Sons, HEWITT & CO., &c.

MISCELLANEOUS EXHIBITS

were very numerous, hardy flowers in particular being staged by Messrs. G. H. White, Worcester; Dicksons, Ltd., Chester; Artindale & Son, Sheffield; Hewitt & Co, Solihull; R. Smith & Co., Worcester, &c. Jones & Son, Shrewsbury, had Sweet Peas; Messrs. Dobbie & Co, Rothesay, had zonal Pelargoniums and Sweet Peas, among the latter some new varieties, to one of which, Florence Molyneux, a First-class Certificate of Merit was awarded; E. Webb & Sons, Stourbridge, who had Gloxinias, hardy flowers, &c. (Large Gold Medal); Jackman & Son, Woking, who had hardy plants; Blackmore & Langdon, Bath, who had grand Begonias; W. L. Pattison, who had Violas, &c.; The Ranelagh Nursery Co., Leamington, who had their new Asparagus and other plants; W. Knight, Wolverhampton, plants, and others, particulars of which could not be gathered up. It was a day of great confusion, but the alacrity and resource shown by the committee to make good their disaster deserve the warmest praise.

MR. W. BROWNE.

THE retirement of Mr. Wm. Browne from the office of Superintendent of Hyde and other Royal Parks in London was made the occasion of presenting him with a handsome silver fruit dish, subscribed for by a number of foreign gardeners who had been employed at various times in the Royal Parks under his supervision. The presentation, at the residence of Mr. Browne in Ramsgate, was made by Herren Gensel and Pichelmayr on behalf of German and German-speaking gardeners. The list of subscribers contained the names of gardeners who are now filling important appointments in Asia, Africa, America, and in different countries of Europe.

Mr. Browne expressed his hearty thanks to the gentlemen above mentioned for the handsome gift, and remarked in the course of conversation that he had never been adverse to but rather in favour of the temporary employment of foreign gardeners in the parks under his superintendence, as he had found them willing workers, and as to skill and learning, quite equal if not superior to the native element.

WILLIAM BROWNE,
FORMERLY SUPERINTENDENT OF HYDE PARK, ETC.

There is prevalent, however, especially among German gardeners, a wish, which has been in their opinion too seldom realised—viz., that their young English colleagues might, for the sake of professional improvement, extend their travels to the Continent in general and to Germany in particular. The benefit accruing from such visits would exert a healthy influence upon the professional character and political feeling of the two countries.

It may not be generally known that Mr. Browne hails from Nottinghamshire, and acquired a general knowledge of the profession at home under his father, who was a nurseryman and seedsman. For further improvement he went to the Royal Gardens, Kew. Being fond of landscape gardening, and naturally inclined to it by his cleverness as a designer and draughtsman, he devoted himself entirely to this most interesting profession, and carried out extensive works under the late Mr. Nesfield and the late Mr. E. Milner. Though formerly employed in the Parks Department of the cities of Liverpool and Manchester, his public career may be said to have commenced when he entered the Government

Parks (so called Royal Parks) of London some thirty years ago.

Mr. Browne terminated his official career as head of the Royal Central Parks, consisting of Hyde Park, Kensington Gardens, St. James's, and Green Parks, and several minor places.

TRADE NOTICES.

NEW INVENTION: AN IMPERISHABLE HORTICULTURAL PAINT.—Mr. Chas. T. Druery, as manager of the Lubrose Paint Company, Moor-gate Station Chambers, E.C., calls our attention to a paint recently introduced into this country, which is admirably adapted for the protection of wood and iron-work in conservatories or green-houses. It is entirely distinct from oil-paints, having an imperishable rubber-like body as a basis, so that the paints form an elastic and strongly adherent skin, which cannot crack, blister, or flake off, and which stands both heat and damp indefinitely. As no priming is required, and two coats equal in covering capacity four of oil-paints, they are very economical in application, apart from greater permanence, while their appearance is equal to the best expensive enamel-paints. An enormous Continental consumption and an experience of five years demonstrate their value beyond a doubt.

MESSRS. DOBBIE & Co., seed growers and florists, of Rothesay, desire us to inform our readers that they have just purchased sixty acres of fine freehold land in the Essex seed-growing district. It lies alongside the main Great Eastern line, and is close to Marks Tey Station. They intend removing their seed-growing operations from Orpington to this new place next season.

Obituary.

WILLIAM THOMPSON.—We regret to hear of the death of a very old correspondent of the *Gard. Chron.*, generally known as "Thompson of Ipswich." According to a note in the *East Anglian Times*, Mr. Thompson had been ailing for some time, and died on July 3, in his eighty-first year. Mr. Thompson was in business for many years at Ipswich, but did not confine his attention solely to commercial affairs. He was one of the first to practise the Daguerreotype system of photography, now rendered obsolete by improved methods. Afterwards he turned his attention to gardening, collecting and distributing seeds of interesting plants, principally hardy plants. His first published catalogue dates from 1855. *Rhodanthe maculata*, a Swan River species, now largely used as a market plant, was introduced by him, as were also *Aquilegia chrysantha*, *Godetia Whitneyi*, *Leptosiphon roseus*, *Phacelia campanularia*, *Clematis coccinea*, and a host of other plants. A volume of the *Botanical Magazine* was dedicated to him by Sir Joseph Hooker, in recognition of Mr. Thompson's efforts in the introduction of interesting plants. Mr. Thompson was also one of the first recipients of the Victoria Medal of Honor, awarded by the Royal Horticultural Society to distinguished horticulturists. From a small plot of ground cultivated as the hobby of an amateur, Mr. Thompson's garden developed into a commercial establishment on a large scale, in the management of which Mr. Thompson was associated with Mr. Morgan.

"A NEW GERMAN GARDENING JOURNAL."

We have received various numbers of *Der Deutsche Gartenrath*, a new weekly Journal published in Berlin, under the Editorship of HERR ANDREAS VOSS. One of the early numbers contains a plea for the planting of the Walnut tree, especially in parks and public gardens, where it is now rarely seen; notes on the Clematis disease, and much information useful to amateur as well as to professional gardeners.

Remarks.—A week of bright sunshine, with drying winds.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 4, is furnished from the Meteorological Office:—

The weather during this week was fine and bright over the country as a whole, but rain was of almost daily occurrence in the extreme north and north-west. Thunderstorms were experienced at many western and northern stations on Thursday.

The temperature was above the mean very generally, the excess ranging from 1° to 2° in most localities, to 4° in England, E. The highest of the maxima, which were recorded on rather irregular dates, but in most cases on Sunday or Thursday, were as high as 86° in England, E., 84° in England, S., and 80° or 81° in several other English localities. In Scotland, N., and Ireland, N., the thermometer recorded no higher reading than 70°. The lowest of the minima occurred either about the middle or at the end of the week, and ranged between 41° in Scotland, N., and 42° in the Midland Counties, England, N.W., and Ireland, S., to 48° in the Channel Islands and Scotland, E., and to 49° in Ireland, N.

The rainfall was very heavy in Scotland, N. and W.—more than three times as great in the former district—and slightly exceeded the mean in Ireland, N. In all other districts excepting Scotland, E. (where the mean was just equalled) there was a deficit, and many stations in the south and east of England were quite rainless.

The bright sunshine was much in excess of the mean over England, but only slightly so in Ireland and in Scotland, W. In Scotland, N., there was less than half the average. The percentage of the possible duration ranged from 73 in England, S., 70 in England, E., and 68 in the Channel Islands, to 32 in Ireland, N., and to no more than 12 in Scotland, N.

THE WEATHER IN WEST HERTS.

Very dry and sunny.—The recent warm spell lasted ten days, but since the 4th the weather has been quite cool, and on one night the exposed thermometer fell to within 9° of the freezing-point. The ground is now at about an average temperature at 2 feet deep, but about 2° colder than is seasonable at 1 foot deep. No rain has fallen for over a fortnight, and since the 27th ult. no measurable quantity of rain-water has come through the bare soil percolation gauge. The sun shone on an average for eight hours a day during the week, or for about two hours a day longer than is usual at this season. The winds continued light until the 2nd, but since then they have been at times high; and on one day the mean velocity for one hour rose to 17 miles, direction west. The atmosphere has been on the whole very dry.

A cold, sunless, and "dripping" June.—This was the coldest June of which I have here any record, that is to say for the last seventeen years. The coldest period of the month lasted a fortnight, during which the temperature remained constantly below the average. The night temperatures, although continuously low during that period, were never very exceptional, but the

highest readings on three days were lower than any previously registered here in the same month, all being below 51°. By way of contrast, it may be stated that on one day at the beginning of the month, and on two days towards its close, the highest temperature in the thermometer-screen rose to or exceeded 80°. No rain fell during the first week and last eleven days of the month, but during the intervening twelve days 5½ ins. were deposited, which is nearly 3½ ins. in excess of the June average, and more than in any June since 1860—or for forty-three years. Besides being very cold and wet, this was a very gloomy June, the record of clear sunshine falling short of the average by more than an hour a day. The winds continued exceptionally light; in fact, at no time did the mean velocity for any hour reach ten miles. There was a remarkable prevalence of north-easterly winds for a summer month—the direction for 436 hours, or eighteen days, being some point between north and east. Only once before in the last seventeen years has the atmosphere in June been as humid, and that was in 1894. E. M., Berkhamsted, July 7, 1903.

MARKETS.

COVENT GARDEN, July 9.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

REMARKS.—Some Bombay Mangos are fetching 12s. to 18s. per dozen; Lisbon Apples sell at 14s. per case, and Italian Plums in baskets, 2s. to 2s. 6d. Only really good Peas fetch 3s. per bushel; a few out-doors Vegetable Marrows are now arriving, and sell at 4s. per dozen, New Zealand Spinach, sieve or half bushel, fetch 2s. 6d., Strawberries British Queen sell at 12s. to 18s. per dozen punnets.

POTATOES.

Cherbourg, 6s. to 7s. per cwt.; home-grown, 7s. to 9s. per cwt. John Bath, 32 & 34, Wellington Street, Covent Garden.

FRUITS AND VEGETABLES.

GLASGOW, July 8.—The following are the averages of the prices during the past week:—Apples, Australian and Tasmanian, 12s. to 16s. per box; Oranges, Valencia, ordinary, 420's, 22s. to 24s. per box; large 420's, 21s. to 22s. do.; extra large 420's, 25s. to 30s. do.; 714's, 27s. to 30s. do.; Lemons, 6s. to 10s. per box, and 7s. to 14s. per case; Grapes, English, 1s. to 2s. 6d. per lb.; Cherries, 8d. to 8d. per lb.; Strawberries, 6d. to 9d. do.; do., Cornish, 4s. to 8s. per dozen punnets; Dutch fruit: Strawberries, 1s. 7d. to 1s. 9d. per basket (about 2½ lb.); Gooseberries, 20s. per cwt.; Dutch Turnips, 5s. per bag, and 4s. to 4s. 6d. per small hamper; Carrots, 5s. to 7s. 6d. do.; Tomatoes, 6d. to 1s. per lb.; Onions, 6s. per bag and 6s. per case; Mushrooms, 1s. to 1s. 3d. per lb.

LIVERPOOL, July 8.—Wholesale Vegetable Market.—Potatoes, per cwt., Kidneys, 10s. 6d. to 12s. 6d. Jersey, 7s. to 8s.; Early Regents, 6s. to 7s. 6d.; St. Malo, 8s. 6d. to 9s.; New, 2s. 6d. to 2s. 9d. per 21 lb.; Turnips, 6d. to 8d. per 12 bunches; Carrots, 8d. to 10d. do.; Onions, foreign, 4s. 9d. to 5s. per cwt.; Parsley, 4d. to 6d. per dozen; Lettuces, 6d. to 10d. per dozen; Cucumbers, 1s. 9d. to 3s. do.; Cauliflowery, 2s. to 3s. do.; Cabbages, 10d. to 1s. 3d. do.; Peas, 4s. 9d. to 7s. per hamper. St. John's:—Potatoes, new, 2d. per lb.; Asparagus, 2s. to 4s. per 100; Peas, 1s. to 1s. 8d. per peck; Cucumbers, 3d. to 6d. each; Apricots, 1s. to 1s. 6d. per dozen; Gooseberries, 3d. per lb.; Currants, Red, 6d. do.; do., Black, 8d. do.; Cherries, 8d. to 10d. do.; Strawberries, 6d. to 8d. do.; Grapes, English, 1s. 6d. to 3s. 6d. do.; Pines, foreign, 4s. 6d. to 6s. each; Mushrooms, 1s. per lb. Birkenhead:—Potatoes, 1s. 4d. to 1s. 8d. per peck; do., new, 1½d. to 3d. per lb.; Peas, 1s. 2d. to 1s. 4d. per peck; Cucumbers, 2d. to 4d. each; Strawberries, 4d. to 6d. per lb.; Currants, Red, 4d. to 6d. do.; do., Black, 8d. do.; Peaches, 4d. to 6d. each; Cherries, 1d. to 2d. per lb.; Apricots, 1s. to 1s. 6d. per dozen; Gooseberries, 3d. to 4d. per lb.; Grapes, English, 2s. to 3s. 6d. do.; Tomatoes, English, 6d. to 10d. do.; do., foreign, 2d. to 3d. do.; Mushrooms, French, 1s. to 1s. 4d. do.; Filberts, 8d. do.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending July 4, 1903, and for the corresponding period of 1902, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1902.		1903.		Difference.	
	s.	d.	s.	d.	s.	d.
Wheat	30	8	27	9	-	2 11
Barley	25	5	20	7	-	4 10
Oats	23	5	18	6	-	3 11

APPLE-TWIG: *H. R.* The injury has probably been caused by cold winds.

BLACK MUSCAT GRAPES: *G. H.* The fruit is affected with the "spot" disease. See answer to "C. H." in our last issue.

BORDEAUX MIXTURE: *W. H. A.* The constituents of the Bordeaux Mixture should be—water 25 gallons, copper sulphate 5 to 6 lb., unslaked lime 5 lb. or more. Dissolve the copper sulphate and lime separately, then thoroughly mix the two liquids together.

CORRECTION. In my notes on Sweet Pea sports, which you did me the honour to publish last week, it reads, "It is Mendel's," when I meant to say, "Is it Mendel's?" *F. J. Coles.*

CUCUMBER: *W. J. W.* The Cucumber-blotch, due to a fungus (*Cercospora*), frequently alluded to and figured in the *Gardeners' Chronicle*. There is, so far as we are aware of, no known remedy except complete destruction. Melons and Cucumbers should not be grown for some years in pits that have held diseased plants, the disease being easily communicable.

CHRYSANTHEMUMS DYING: *S. F. M. (Journeyman).* The plants are quite free from any injury caused by fungi or insects. The roots are dead. Can it be due to the use of some fertiliser used?

GARDENERS' TRIPS TO LONDON IN ORDER TO INSPECT THE PUBLIC PARKS, BOTANIC GARDENS, AND GARDENS: *D. T.* The places most worthy of a gardener's attention are the Royal Botanic Gardens, Kew; Royal Botanic Gardens, Regent's Park; and the neighbouring Zoological Gardens, where bedding-out is well done; Royal Horticultural Society's Garden, Chiswick; the Crystal Palace, Sydenham, ten miles out; such parks as Hyde, St. James's, Battersea, Victoria, the Embankment Gardens, Charing Cross; Peckham and Greenwich Parks. Of nurseries that would repay a visit mention may be made of Messrs. Sander & Sons, St. Albans; Messrs. J. Veitch & Sons, Chelsea; Hugh Low & Co., Enfield; W. Cutbush & Son and H. Williams & Son, Fortis Green, Finchley; Fromow & Son, Chiswick; R. & G. Cutbush, Southgate; Messrs. Laing & Sons, Forest Hill, S.E.; W. Bull & Sons, Chelsea; Messrs. Rivers & Sons, Sawbridgeworth, for fruit culture; Paul & Son, Cheshunt, for Roses and fruit; W. Paul & Son, Waltham Cross; H. Lane & Son, Berkhamstead, for Roses, fruits, Conifers, &c. The establishments of Jas. Rochford and T. Rochford at Broxbourne should not be forgotten, nor the gardens of Syon House, Brentford. Including rail and hotel expenses the outlay should not exceed £1 per day.

MELON FOLIAGE AND FRUIT OF NECTARINE: *F. Y.* The leaves of the Melon are affected with the Melon-blotch fungus, *Cercospora*, for the treatment of which see recent issues of the *Gardeners' Chronicle*; and the fruit has been affected with the Peach-mildew—for remedies also see recent issues of this journal.

MELONS DROPPING THEIR FRUITS: *A. J. P.* If you have no bed of fermenting materials under the bed, or if there is such bed, the warmth has materially declined. Perhaps you could apply

linings of hot stable-manure and tree-leaves, 1½ ft. to 2 ft. thick, round the bed, first cutting away the margin of the original bed close up to the frames. If this be done, you must be careful not to let the fumes of fermentation get into the frames; and to make sure that no harm is done a small amount of air should be afforded at night. The Melon will not succeed in this country without bottom-heat of 80°.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*J. S., Sleaford.* *Trifolium maritimum.*—*T. M.* *Coronilla varia.*—*E. A. T.* *Oncidium divaricatum.*—*Harry Williams.* *Gaultheria shallon.*—*W. Brown.* Certainly not a *Canna*, probably an Aroid.—*A. H.* 7, *Indigofera* species; 8, *Hemerocallis flava*; 9, *Sida malvaeflora*; 10, *Stenactis speciosa*; 11, *Festuca glauca*; 12, *Inula glandulosa.*—*E. G.* Specimens partly withered. 1, *Achillea* species; 2, *Campanula persicifolia*; 3, *Baptisia* species; 4, *Lupinus perennis alba*; 5, *Spiraea arifolia*; 6, *Eryngium alpinum*; 7, *Senecio doronicum*; 8, *Potentilla*, garden variety; 9, *Aconitum*, probably japonicum, flowers fallen; 10, *Veronica teucrium*; 11, *Anthericum liliago*; 12, *Armeria cephalotes.*—*T. W. R.* 1, probably a form of *P. contorta*, but it is impossible to speak with certainty; 2, *Viburnum opulus*; 3, *Orchis maculata*; 4, *Lychnis dioica.*—*M. Buysman.* *Stachys recta.*—*T. C. K.* 1, *Claytonia perfoliata*; 2, if a tree, *Cercis siliquastrum*; 3, *Ranunculus flammula*; 4, *Spiraea filipendula.*—*William.* 1, *Thalictrum flavum*; 2, *Astrantia major*; 3, *Oxalis rosea*; 4, *Helenium autumnale*; 5, *Tropeolum polyphyllum*; 6, *Digitalis lutea*; 7, *Epilobium angustifolium*, white var.; 8, *Echium vulgare*; 9, *Anthericum lineare variegatum.*—*Phyto.* 1, *Egopodium Podagraria*; 2, a *Geum* probably; 3, *Veronica officinalis*; 4, cannot recognise; 5, *Gaultheria Shallon.*—*G. R., Wrexham.* 1, *Clematis flammula*; 2, *Astrantia major.*—*T. G. C.* 1, *Photinia serrulata*; 2, Perhaps *Exochorda grandiflora*; 3, *Rhus Cotinus*; 4, Perhaps *Sophora japonica*; we cannot tell from flowerless scraps, withered when we received them.—*G. H. S.* Your specimens will be named next week. We acknowledge the receipt of 2s. for the Gardeners' Orphan Fund, but we do not recollect to have received any former sum from you, or specimens.—*Soeze.* 1, *Pteris cretica*; 2, *P. cretica albo-lineata*; 3, *P. serrulata cristata*; 4, *Ophiopogon Jaburum variegatum*; 5, *Scolopendrium vulgare* var.; 6, *Pellaea falcata*; 7, *Lygodium scandens.*—*A. L. S.* *Dendrobium moschatum* and *Lilium Martagon.*—*E. A. T.* All varieties of *Oncidium pretectum.*—*Subscriber.* *Stanhopea oculata.*

PEACHES UNDER GLASS WITHOUT FLAVOUR: *G. V.* A lack of flavour and sweetness is found in most kinds of early fruits this year, owing doubtless to the remarkable absence of sunshine, the want of flavour, &c., varying in degree with the amount of sunshine enjoyed. In such years the gardener can do but little to counteract the want of sunshine, and the consequent small quantity of air admitted to the forcing-houses, beyond exposing the fruit to the light by pushing aside the leaves that shade it, maintaining dryish conditions in the air of the house, and employing fire-heat by day so as to admit of a larger amount of ventilation than could otherwise be afforded. Top-dressings of potash occasionally afforded, at the rate of 2 ozs. per square yard, favour fine colouring in Peaches and Nectarines.

POPPY: *F. C. A.* A case of doubling, not of hybridisation.

RATING OF MARKET GARDENS: *F. P.* At one time, *vide* case of Purser v. Worthing Local Government Board, reported in *Gardeners' Chronicle*, March 26, 1887, buildings in a market garden were rated, not as "buildings," but as "agricultural land." This view, however, was altered, *vide* Piper's case, see *Gardeners' Chronicle*, March 19, 1898, where the Master of the Rolls, Lord Justice Rigby agreeing with him, said, "The only conclusion at which I can arrive is that buildings are not to be treated as agricultural land for rating purposes under this Act of Parliament."

TOMATOS: *S. D. & Son.* On soaking the leaves for a few hours in water, we found the purple colour discharged.

TOMATOS NOT SETTING THEIR FLOWERS: *E. G.* Given ample space the flowers that show low down on the plant will set, but closely planted the Tomato seldom fruits at a less distance from the soil than 2½ feet. Ten-foot-high plants should fruit at a later date if not exhausted greatly by the crop of fruit lower down. Try artificial fertilisation of the blossoms.

VINES: *R. F.* The Grapes are affected with the "spot" fungus (*Gloeosporium ampelophagum*). Mr. Massee recommends that the shoots and leaves should be dredged with flowers-of-sulphur, repeating at intervals of ten days if the disease continues to spread. A small quantity of quicklime should be mixed with the sulphur on the second application, and the quantity of lime increased on each successive application until the proportions of lime and sulphur are nearly equal, always keeping just a little more sulphur than lime. Diseased leaves and shoots should be collected and burned, and diseased fruit should be removed as speedily as possible. See fig. in *Gardeners' Chronicle*, Dec. 6, 1890, p. 657, as *Gloeosporium laticolor*.

GARDENING APPOINTMENTS.

MR. F. W. RUSSELL, until recently Gardener at Avon Castle, Ringwood, as Gardener to Lady ESME GORDON, Paxton Park, St. Neots, Hunts.
MR. WM. MACGILLIVRAY, at present Foreman in the gardens at Balcarras, as Head Gardener to PETER WOODIE, Esq., Millersneuk, Lenzie, N.B.
MR. F. JACKSON, previously Foreman in the gardens, Willington Hall, Tarporley, has succeeded Mr. Podmore as Head Gardener to J. SPENCER PHILLIPS, Esq., of the Mount, Shrewsbury.
MR. F. SMITH, Foreman in the gardens at Gawthorpe Hall, Burnley, as Gardener to Mrs. BIRKBECK, Auley Hall, Settle. [The money (1s. 6d.) sent has been placed in our collecting-box for the Royal Gardeners' Orphan Fund.]
MR. E. D. MENZIES, as Head Gardener to J. W. GARTON, Esq., Clarendon Park, Salisbury, in succession to Chas. Warden.
MR. J. DAVIS, for eight years Head Gardener at Brooklands, Bakewell, Derbyshire, as Steward and Head Gardener to Colonel E. R. STEWART RICHARDSON, Ballathie, Stanley, Perthshire, N.B., and entered on his duties June 1.
MR. A. E. BAMBRIDGE, previously Foreman in the gardens at Gatton Park, Reigate, as Gardener to Sir JOHN HOLLAMS, Bart., Dene Park, Tonbridge. [No charge is made for these announcements. The shilling sent has been put into the *Gardeners' Chronicle* Box of the Royal Gardeners' Orphan Fund.]
MR. W. CLOWN, formerly Gardener for seven years at Braxted Park, Essex, as Gardener and Steward to Mrs. EASTWOOD, Kingswood, Englefield Green, Egham, Surrey.

HYBRID IRIS, VAR. REINETTE, RAISED BY MR. CAPARNE: COLOUR, PALE BLUE.

WORN-OUT ORCHARDS.

THE question is sometimes asked why nursery trees may not be successfully raised continuously under good culture for a considerable number of years on the same land. It has long been known that a crop of nursery trees does not remove large amounts of plant-food from the soil, and investigations seem to prove that the roots of nursery stock do not in any sense poison or injure the land; so that some other explanation than soil exhaustion must be found to explain the reason for nursery trees failing to give good results when preceded by trees of the same kind.

Professor J. P. Roberts, of the Cornell University, N.Y., has for some years been carrying on a series of investigations in the hope that some light may be thrown upon the question of the depletion of the soil by fruit trees. The first thing done was to determine as far as possible the amount of plant-food which is taken from the land by old and young fruit-trees and their fruit. It was found that a healthy, normal-sized "Wagner" Apple tree, thirteen years old from planting, about 18 to 20 feet high, having a trunk $7\frac{1}{2}$ inches in diameter, produced a total growth of leaves which weighed nearly 33½ lb. These when fully dried yielded

52 per cent. of dry substance; and the dry substance when burnt gave 9½ per cent. of ashes. On analysis the leaves showed—of nitrogen, 1.85 per cent.; phosphoric acid, 0.49 per cent.; and of potash, 1.76 per cent.

The following table gives total weight and chemical composition of the leaves of the single "Wagner" Apple-tree, and also the amount of plant-food contained in an acre of like manner, assuming that the trees were set 35 feet apart, which would give thirty-five trees to the acre:—

	Single tree.	Amount per acre.
	lb.	lb.
Total weight of leaves ...	33 18	1,161
" " " water in leaves.	15 92	557
" " " dry substance.	17 26	604
" " " nitrogen ...	0 29	10
" " " phosphoric acid	0 08	3
" " " potash ...	0 28	10

Assuming that the thirty-five trees would bear in five years from the time they were thirteen years of age 25 bushels of Apples per tree, or 5 bushels to the tree per year, they would take from the soil the following constituents by the growth of their leaves and fruit:—

	Apples.	Leaves.
Nitrogen ...	55 lb.	51 lb.
Phosphoric acid ...	4 "	14 "
Potash ...	81 "	49 "

Assuming that in the next five years the trees would bear 10 bushels per year, or 50 bushels per tree in all, and that the leaves had increased in the same ratio as the Apples, the following results are reached for the second five years:—

	Apples.	Leaves.
Nitrogen ...	110 lb.	102 lb.
Phosphoric acid ...	8 "	28 "
Potash ...	162 "	98 "

Further, assuming that the trees had reached full maturity at twenty-three years from setting, and that they produce on an average 15 bushels of Apples per tree for the next ten years, and that the leaves have increased correspondingly, the following results will be obtained for the third period of ten years:—

	Apples.	Leaves.
Nitrogen ...	332 lb.	304 lb.
Phosphoric acid ...	25 "	84 "
Potash ...	488 "	294 "

Or taking the whole bearing period of twenty years, from the time the tree was thirteen years old from setting until it was thirty-three years old, the following total amount of plant-food constituents, in leaves and in fruit, would be abstracted from the soil:—

	Apples.	Leaves.
Nitrogen ...	497 lb.	457 lb.
Phosphoric acid ...	37 "	126 "
Potash ...	729 "	441 "

While the above results are obtained by assuming a given quantity of Apples and leaves per year in a bearing orchard, and while the facts in any given case at any given time may vary widely, yet it is believed that they are valuable as furnishing a means of measuring in any given case, with some degree of accuracy, the amount of soil-exhaustion by Apple-growing.

It is seen from the data given that 5 bushels of Apples from each of thirty-five trees, equal 175 bushels, remove in round numbers 11 lb. of nitrogen, nearly 1 lb. of phosphoric acid, and 16 lb. of potash; and that the leaves from the trees large enough to produce those Apples would contain 10 lb.

of nitrogen, nearly 3 lb. of phosphoric acid, and 10 lb. of potash; or a total of leaves and fruit together of 21 lb. of nitrogen, 4 lb. of phosphoric acid, and 26 lb. of potash. It will thus be seen how easily the figures can be used to determine approximately the amount and kind of plant-food used by Apple-trees in any given case.

It is true that in a particular year a mature tree might produce as many Apples as the quantity assumed, and in another year fail to produce any, yet a computation could be made from the data given which would throw much light on the vexed question of orchard soil depletion.

The following investigations show the amount of plant-food demanded or used by old orchard trees. A tree nearly destitute of Apples, in a fairly thrifty condition, but below the normal size of trees of its age, was selected for examination, and gave the following results:—

Chemical Composition of Different Parts of an Apple-tree.

	Leaves.	Twigs.	Limbs and Trunk.	Roots.
	lb.	lb.	lb.	lb.
Total weight ...	232	172	3,973	841
Dry substance ...	93	84	2,318	416
Nitrogen ...	1 0	0 9	5	0 9
Phosphoric acid ...	0 4	0 3	2	0 4
Potash ...	1 3	0 7	5	0 9

One large root was found to be entirely decayed; hence it is probable that the percentage of roots as compared to trunk is less than the average.

It is estimated that the total weight of yearly wood (twigs) from an acre of Apple-trees would be 5,251 lb., and that the leaves from an acre of trees would weigh 8,121 lb.

The total amount of constituents, exclusive of that stored up in the structure of an acre of mature Apple-trees, would be—of nitrogen, 1,337 lb.; phosphoric acid, 310 lb.; and of potash, 1,895 lb. To restore the potash alone, as indicated by these figures, and that used by the growth of the trees, would require about 7 tons of kainit salt, containing 12 per cent. of potash; and to restore the nitrogen would require 12 tons per acre of a fertiliser containing 5 per cent. of nitrogen.

Very much of this plant-food could be furnished to the orchard soil by the growth of a leguminous crop (Clover, &c.) among the trees, and by feeding supplementary foods to farm animals which might be put to graze it, and some of the plant-foot would of course be returned to the soil by the fallen leaves which are not carried off by wind.

Professor Roberts says, "Many old orchards have not only been making these large demands on the soil for the last twenty years, but in many instances the land has been used for the production of hay or grain crops in addition, and frequently for the grazing of animals, with little or no supplementary food. The grazing of orchards, especially with growing animals without extra food, is as certain to deplete the land as the raising of grain or other farm crops, though the soil robbery is not so rapid.

These investigations, when considered in all their bearings, lead one to wonder, not why old orchards are failing, but why they have not ceased to produce marketable fruit long since.

NEW OR NOTEWORTHY PLANTS.

ALLIUM ALBOPILOSUM, C. H. Wright,
*sp. nov.**

[See Supplementary Illustration.]

☐ This Allium was first received in flower at Kew in June, 1902, from the Hon. Charles Ellis, and is now flowering in the herbaceous ground. Flowering specimens have just been received from Van Tubergen, of Haarlem, for whom the bulbs were collected in 1901 by Sintenis in "the mountain range that divides Transcaspia from Persia." The leaves are about 18 inches long, and vary from 1 inch to 2 inches in breadth; they are glabrous on the upper surface, but furnished on the lower and margins with many scattered white hairs, whence the specific name. The scape is about a foot high, and bears about eighty flowers in an umbel, 8 inches or more in

MARKET GARDENING.

MELON AND CUCUMBER LEAF-SPOT.

THIS new plague of the gardener, for which apparently no remedy can be found. The "spot" starts usually in damp or dull weather, and at the end of the house nearest to the door, and with sunshine it spreads very rapidly. I know of one experienced grower who is actively engaged in taking off the infected leaves as they appear, by so doing hoping to finish the present crop of Cucumbers, even if such only make "seconds" in the market. In this instance it is particularly disappointing, as he has had no Cucumbers on his place for some seven or eight years. The disease is very prevalent in Middlesex, Herts, Surrey, Sussex, and Kent, the skill of the growers availing nothing against it. In one instance one grower having a good winter crop without spot, repeated the planting; but these

If Cucumbers could be grown on the old lines, we should hear nothing of the "spot"; but the grower must needs take two crops in a limited period of time, and his methods account to my thinking the why and wherefore of the prevalence of the disease.

MARKET GRAPES.

"Raise the standard of quality, and prices will be higher." Such is the opinion of Mr. A. Lodge, Mill Hill, N.W., an excellent cultivator of the Black Hamburg; and he is able to support this statement by the fact of his obtaining 4s. per lb. for most of those he sent to market in the third week in June. The bunches are above medium size for market Grapes, four bunches just going into a cross-handled basket weighing 7 lb., the berries being of good size, and colour also good. His Vines were uniformly cropped, and he grows no other variety. *Stephen Castle.*

FLOWER-GARDEN AT CLAVERTON MANOR.

THIS residence, until recently, we believe, without a tenant for some time, possesses gardens which contain several delightful features; one of them, a Rose arcade, formed the subject of an illustration in the *Gardeners' Chronicle* for July 4. The fig. 14 in the present issue depicts a flower-garden having a terrace walk, and a turfed bank at one side, and flower-beds that stretch away from the foot of the bank on a level plateau. As befits a terrace-garden there are numerous flower-vases and a massive balustrade, and vegetation, which, when not naturally formal in shape, is made so by the gardener's art.

HYBRID SUGAR-CANES.

THE idea of raising hybrid Sugar-canes is by no means a new one in the West Indies; it was raised by Professor d'Albuquerque at the second Agricultural Conference in 1900 (*West Indian Bulletin*, vol. i., p. 182). Professor Harrison and Mr. Hart have both mentioned the possibility that some of the seedling canes which are being raised throughout the West Indies are the result of the accidental crossing of two varieties of Cane, and in the *Agricultural News* (vol. i., p. 146) we drew attention to some successful experiments that have been made in Java, by Drs. Wakker and Kobus, in hybridising various varieties of Cane, more particularly the Cheribon and an imported Indian Cane, the Chunnec.

The process adopted in Java was an extremely simple one. Dr. Wakker discovered that the pollen (the part of the flower containing the male elements) of certain varieties of Cane, notably the Cheribon, was infertile, while the ovary (the female part of the flower) was normal. Other varieties of Cane, including the Chunnec, were shown to possess normal, fertile pollen. It was only necessary, therefore, to plant canes of two varieties, one with normal pollen and one without, in alternate rows, the wind would then carry the normal pollen of the one variety to the ovary of the other, fertilisation would take place and seeds would be produced. These seeds, borne on the variety with infertile pollen, would necessarily be the result of a cross, and the Canes raised from them would be hybrids. In the case of the Cheribon and Chunnec Canes the experiment was a success: the Cheribon produced fertile seeds; and since then Dr. Kobus has succeeded in raising many thousands of hybrid Canes.

The first question to arise in the mind of a practical man would be: Is it worth while? Or, in other words: What advantages does this new method of obtaining fresh varieties possess over the method of raising seedling Canes which has been in operation for some years and which has

FIG. 14.—FLOWER GARDEN AT CLAVERTON, SOMERSETSHIRE.

diameter. The flowers (nearly 2 inches in diameter) are about the largest in the genus, and resemble a star with narrow rays; their colour is a deep lilac with a metallic sheen. A figure of this plant has been prepared for the *Botanical Magazine*.

[Our illustration (see Supplement) is taken from a specimen forwarded to us more than a year ago by Messrs. Van Tubergen, of Haarlem. The species is the most imposing-looking member of the genus. Ed.]

* *Allium albopilosum*, C. H. Wright.—A. Jesdiano, Boiss. et Buhse, proximum, foliis subtus pilosis, perianthii segmentis quam pedicelli dimidio brevioribus differt. Folia lanceolata, plus minusve acuminata, 18 poll. longa, supra glabra, superficie inferiore marginibusque pilis pluribus albis sparsis instructis. Scapus 1 ped. altus, 5 lin. diam., glaber, teres, circa 80 florus. Spathæ tres, late, acuminatæ, membranaceæ. Pedicelli 2 poll. longi, 3/4 lin. diam., tereti, glabri. Perianthii segmenta linearia, acuminata, obscure lilacina, 10 lin. longa, 1/2 lin. lata. Stamina 5 lin. longa; filamenta atropurpurea, subulata, basi dilatata; antheræ oblongæ, 1 lin. longæ; pollen caesio-viride. Ovarium minute verrucosum, lobis 3 globosis (ovario Euphorbiæ simile); stylus subulatus, 3 lin. longus.

Hab., mountain range dividing Transcaspia from Persia: Sintenis legit. No. 308.

plants are all so gone off with the spot, that they are being cleared out and Tomatos planted.

I also now know of a very extensive firm of growers who have given up entirely for this year and are cultivating Tomatos instead, hoping next year to succeed with the Cucumbers. The effects of the disease are evident from the short supply of Cucumbers of the best quality.

Whether rich feeding has anything to do with the prevalence of the disease or not, one finds growers who make use of far richer composts than I ever touched; practically it is half-and-half—one layer of loam, one of rich stable or farmyard manure. This is put together some time before using, the result being a very rich mass of food given all at once to the roots, and heavy crops are obtained if the disease does not appear on the plants. Not content with an over-rich soil, a heavy mulch of decayed manure follows as the crop comes on, this again being correct to a certain degree, if plants are healthy. Lastly comes the question of how far the free use of the hose is desirable [seeing that it may scatter the spores broadcast]. Water in most cases, if not actually cold, certainly colder than water was used in my day, and the water afforded the roots has not had the chill taken off it.

been very successful? That the method of raising new varieties by hybridisation does possess advantages over the simpler process of raising them by selection is amply shown by the fact that it is practised by plant breeders all over the world. It must be remembered, too, that the Sugar-cane is probably the only cultivated plant with regard to which the raising of hybrids is such an easy matter as described above. With other plants, artificial crossing has to be resorted to, and this is a very delicate operation necessitating great care.

Mr. Lewton-Brain points out that crossing offers two advantages. In the first place the hybrid offspring of a cross is far more variable than pure-bred plants, so that the chances of obtaining a valuable seedling are proportionately increased. Again, it has often been found possible to combine in a hybrid the good qualities of both parents, as for example a large yield with excellent quality, or hardiness with good yield.

That this can be done is shown by the results obtained by plant breeders in other parts of the world. Messrs. Garton in England have obtained numerous hybrid varieties of Wheat, Oats, and other cereals which combine the good qualities of both parents. Mr. Farrer in New South Wales, again, has succeeded in raising hybrid varieties of Wheat which combine resistance to disease with high yield and other good characters. Hybrids between good wine-producing and disease-resisting varieties of the Grape-vine have also been obtained combining these qualities of the parents. It is, however, not necessary to go further afield than the experiments of Drs. Kobus and Wakker mentioned above. As a result of crossing the Cheribon and Chunnee, "Canes combining both high sugar content and disease-resisting power have been obtained."

In Mr. Lewton-Brain's paper the results of his observations on the pollen of West Indian varieties of Sugar-cane are given. Of the Canes examined, sixteen varieties were found to possess "a very small proportion of normal pollen," while eighteen showed "a large proportion of normal pollen." It is evident that hybrids might easily be raised between two varieties, one from each of these classes, on the lines followed by Drs. Wakker and Kobus.

It must be remembered, however, that success must not be looked for at the first trial; hybrids will probably be obtained, but most, if not all, of them will prove inferior to the parents. If one or two good hybrids are obtained after very numerous trials, the experiments will be as successful as could have been expected. *The Agricultural News*, May 9, 1903.

ORCHID NOTES AND GLEANINGS.

SANDERS' "ORCHID GUIDE."

MESSRS. SANDER & SONS have issued a Supplement to their useful *Orchid Guide*. It consists of a very full list of hybrids raised or recorded since the publication of the parent work in 1901. The tables give the names of the hybrids, and an indication of their parentage in a series of tables conveniently arranged for reference. We note that Messrs. Sander on their title-page say, "All rights reserved." In so saying they will not question our right to thank them, on behalf of Orchid-growers, for this very useful publication.

AERIDES ODORATUM.

Many years ago, grand specimens of this fine Orchid, having numerous flower-spikes, formed attractive objects at flower-shows and in Orchid-houses, which were invariably kept at stove-house temperature. It is a plant but seldom observed at the present day, East Indian Orchids having given place to the cool and intermediate house species. There are, nevertheless, few more attrac-

tive or more fragrant Orchids than *Aerides odoratum*, its white and rose-coloured wax-like flowers being more beautiful and more lasting than those of more recent introduction. An inflorescence from an imported plant is kindly sent by D. Campbell Brown, Esq., Bank of Scotland House, Oban, N.B., who states that it is growing well in a pot in peat, sphagnum, and charcoal, and suspended in a warm house.

COLAX JUGOSUS.

A very singular and handsome form of this pretty cool-house Orchid is in flower at Mr. E. Kromer's nursery, Bandon Hill, Croydon. The flowers are of fine form, the sepals of the usual whitish colour, with a green tint on the veining, but differing from the ordinary form in having a

THE KITCHEN-GARDEN, CROMARTY HOUSE.

OUR illustration (fig. 15) exhibits a phase of kitchen-garden arrangement much in vogue in the North of England and in Scotland, which is a combination of the æsthetic and the severely useful, borders for flowers for cutting, hardy herbaceous perennials, bulbs, and tender exotics in variety, shutting out the view of beds of Onions, Cabbages, &c. Once such borders displayed ribbons of colour, furnished by *Verbenas*, *Calceolarias*, zonal *Pelargoniums*, *Lobelia erinus*, *Golden Feather*, &c. Happily, these are no longer the fashion, and the mixed border has taken their place in most gardens in which flowers, vegetables, and fruit are grown in juxtaposition.

FIG. 15.—KITCHEN-GARDEN AT CROMARTY HOUSE, N.B.

brown-purple spotting on the base of the upper sepal and on the lower halves of the lateral sepals. The petals have the usual purple spotting, with the addition of a broad central band of densely-spotted brown-purple. The labellum is violet coloured, and the whole flower very attractive. Some good *Cattleya Warneri* and other Orchids are also in bloom.

CATTELEYA × FAERIE QUEENE (REX × MOSSIE).

This very pretty hybrid has flowered in the collection of H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood). The flowers are nearly as large as those of *Cattleya Mossie*, but the colours are nearer to those of *C. Rex*. The sepals and petals are of a clear light yellow, and the labellum, which exhibits strong indications of *C. Rex* in the tubular form of the lower part of the lip and the prismatic arrangement of the colours in the throat, is of a rich rosy-crimson hue, with a lighter rose veining extending from the disc of the lip to the margin, which is of a lighter colour. The plant is of free growth, and does not exhibit the stunted characters which are often met with in *C. Rex*. *J. O'B.*

Mr. Henry Henderson, the head gardener to Col. Ross, C.B., Cromarty House, Ross-shire, N.B., who kindly furnished the photograph from which the illustration was prepared, supplied the following particulars of his method of treating the *Narcissus* :—

"The plants shown in the illustration in lines on either hand consist of *Narcissus poeticus*, which does exceedingly well in this garden, the soil of which is of medium consistency, being neither too light nor too heavy. When re-planting becomes necessary, the bulbs are lifted towards the end of the month of July, sometimes earlier and sometimes later, taking as a guide the leaves when they begin to turn yellow. Having given the ground a good digging, the bulbs are planted in a trench 8 inches deep cut out with a spade. The bulbs stand when planted at 2 to 3 inches apart. This species of *Narcissus* often comes "blind," that is, scapes only are produced. It is my opinion that the cause of this is shallow planting. Trumpet Daffodils, too, do well here, including *N. incomparabilis* varieties, of which we have a few. Sir Watkin is deservedly a special favourite here; and Prince of

Wales is another fine cupped Daffodil that succeeds; also Cynosure and many others. The soil is not afforded animal manure, nothing further being applied than basic slag and superphosphate of lime at the rate of 4 oz. per square yard.

CULTURAL MEMORANDA.

PERGULARIA ODORATISSIMA.

It seems somewhat strange that one very seldom meets with this stove climber, or even comes across its name in plant catalogues, seeing that the plant is of easy culture, is a good grower, and produces its clusters of dull yellow, delightfully scented flowers freely under simple conditions. Given good drainage and a sound fibrous sandy loam in which to root, and the shoots trained thinly not far from the roof of a plant or Pine stove, the plant will make free growth and flower in due time. The wood is hairy, and somewhat long-jointed in growth, the leaves being about 4 inches in length, acutely ovate, and pale green in colour.

If cuttings of the young growths about 2 inches in length are taken off with a heel of old wood attached and inserted round the edge of 3-inch pots filled with light mould, surfaced with sand, and afforded water by means of a fine rose can, and then placed under a bell-glass or a small handlight, anywhere in heat, they will form roots within three weeks from the time of putting them in. They should then be potted singly into small pots and returned to heat, water being afforded to settle the soil about the roots. Afterwards maintain the soil in a uniformly moist condition, and shift into larger pots before the roots become matted, until they are potted into their flowering pots—pots from 8 to 10 inches in diameter. The plants should be syringed overhead morning and afternoon during the period of active growth, in order to keep them free from red-spider. *H. W. Ward.*

PLANTING AND PRICKING-OUT.

At this season, when so much is being done in planting and pricking-out seedlings, much patience is required and a deal of forethought, else in one night the work of several months may be rendered futile. Many plants would be all the better for a few more days' hardening, and plants of many kinds suffer from being put out during sharp winds.

When pricking-out seedlings, take care that the roots are as far as practicable taken up intact, or the greater the loss of roots the more difficult it is for the plants to make a start. Do not take out too many seedlings at a time, to lie about and get dry; and if by any means you are called away, place a little soil or damp moss over them till your return. As the work of pricking out proceeds, gently spray the plants, and do not expose them to the wind, keeping them close and shaded from sunshine till they recover, after which air and less shade should be gradually afforded.

In planting out, whether it be vegetables or flowering-plants, this should be carefully carried out. Transplanting should always be performed with a trowel, and the hole made large enough to easily accommodate the root mass and a little more. Nothing is worse than to cram the ball into a hole that is too small. When a plant is placed in the hole, press the soil firmly round about it, more or less according to the nature of the soil; and if the soil be dry water may be applied. Protection is the next thing usually required. If birds attack, I have found nothing better than black cotton stretched across at a few inches about the plants. If slugs and snails are troublesome, get some fine quicklime and soot, and sprinkle thickly around; lay about leaves of Cabbage as traps, which should be inspected twice daily; or apply a good dusting of native guano, which is a good preventative of loss by slugs in many instances. *W. A. Cook.*

BROWN ROT OF FRUIT (*SCLEROTINIA FRUCTIGENA*, Schröter).

This is undoubtedly one of the most general and also the most destructive of diseases against which the fruit-grower has to contend. It attacks Apples, Pears, Plums, Cherries, Peaches, and is also not uncommon on various wild fruits belonging to the order Rosaceæ, as Bullace, Crab, &c.

To the ordinary observer this disease first attracts attention when it appears on the fruit under the form of brownish scattered patches on the skin. This is followed by the growth of dull grey tufts (the so-called *Monilia* fungus), which are usually arranged in irregular concentric rings. These grey tufts are composed of dense masses of spores arranged in long branched chains. The fairy-ring arrangement of the fungus is most evident on Apples and Pears; on Plums, Cherries, and stone fruit generally, the grey tufts are irregularly scattered over the surface.

Although most obvious on the fruit, the fungus usually first attacks the leaves, where it forms thin, velvety, olive-green patches. The spores from diseased leaves are washed by rain or carried by insects on to the surface of the young fruit, or not infrequently the flowers are also inoculated from spores derived from young leaves; and in many instances where brown and shrivelled blossoms are attributed to the action of a late frost, the true cause is in reality due to the *Monilia* fungus. In those instances where the disease has been allowed to follow its course undisturbed for some years, the young shoots of the trees are also attacked and killed during the first or second year. The fungus develops rapidly on such dead twigs, and furnishes a ready supply of spores, which are mature during April and May, just when the young leaves and blossom are most susceptible, and wholesale infection results.

Fruit attacked by this disease does not rot and decay, but becomes dry and mummified. Such fruit often remains hanging on the tree until the following season. Whether it does so or falls to the ground, it is practically unchanged until the following spring, when its entire surface becomes covered with a copious crop of spores, which are dispersed by various agencies, and the disease repeats itself. It has long been suspected that the *Monilia* represented but one stage in the life-cycle of the fungus; this supposition has proved to be correct, the second or ascigerous form of fruit having been found growing abundantly on old half-buried Peaches in several orchards in different parts of the United States, where the fungus proves quite as destructive as with us.

PREVENTIVE MEASURES.

All dead twigs and shrivelled fruit, whether hanging on the tree or lying on the ground, should be collected and burned during the winter. After the diseased fruit and dead branches have been removed, the trees and also the ground should be thoroughly drenched with a solution of sulphate of iron, prepared as follows:—

Sulphate of iron	25 pounds
Sulphuric acid	1 pint
Water	50 gallons

Pour the sulphuric acid upon the sulphate of iron, then add the 50 gallons of water by degrees. A barrel is the best vessel to use; a metal vessel must not be used, as it would be acted upon by the sulphuric acid. Spraying with the above solution should be done in January or February, before the leaf-buds begin to swell in the least, otherwise the foliage and blossom will be destroyed. When the leaf-buds are expanding, and at intervals as required, the trees should be sprayed with quite weak Bordeaux-mixture. The above line of treatment must be followed for at least two seasons. *Board of Agriculture.*

NOTES ON IRRIGATION IN THE WESTERN STATES OF AMERICA.*

NEARLY 6,000,000 square miles in the western United States are irrigated, where the climate is arid or sub-humid. In the first kind it is absolutely necessary, in the second there is an insufficient supply of rain to secure maximum crops. This is in five of the States, while the former covers eleven States and Territories. But the farmers of the eastern or humid side, as, e.g., of Wisconsin, are finding out the profit from artificial irrigation. "During the season of 1896, in which the rainfall was normal in this State, various crops were irrigated with profit." Thus it was on corn (presumably Maize), \$2.16 per acre; Potatoes, \$11.70; Cabbages, planted thin, \$2.43, and planted thick, \$29, &c. The great lesson to be learnt is that there must be an abundance of water in order that the crops may avail themselves of the plant-food stored in the soils; not that water is everything, but the fertility of the soil counts for naught without it.

The greatest profit is derived from irrigation where intensive farming is practised, in which the aim should be to economise all the elements of fertility, water, labour, &c., to the best possible advantage. Where fertilisers are used they should be kept in the upper layers of the soil, and if irrigation be practised also, it should be in moderation, lest the fertilisers be washed into the lower layers of the soil or be removed by drainage.

M. Ed. Gain has found from experiments that it would be very injurious to maintain a uniform state of moisture in the soil. The optimum of moisture in the soil at different stages of growth were about as follows:—"At the time of planting the soil should have about 25 per cent. of the total amount of water which it is capable of holding; then it should fall to 15 per cent., and remain at this point until the first leaves are formed, when it should be raised quickly to nearly 40 per cent. It should be allowed to fall rapidly to about 25 per cent., and remain at this point until shortly before flowering, when it may be raised gradually to 40 per cent., and then allowed to fall rapidly to 12 or 15 per cent., where it remains during fruiting and maturity." These are, of course, ideal conditions, to be aimed at as approximately as possible.

With regard to the methods of irrigation, sub-irrigation by drain-pipes has not proved satisfactory. It was found that a given amount of water was much more effective in increasing the yield of corn when applied by surface irrigation than when applied by sub-irrigation.

The following method in the cultivation of Celery, however, was found to be very effective:—"Common porous 2½-inch drain pipes were placed in a continuous row, end to end, on the surface of the soil, the vegetables being planted on either or both sides of the line. The pipes were 1 foot long, and by pouring in the water at one end of the line, it was distributed at the joints throughout the length desired, when the opposite end was stopped up. The Celery was planted, and while it was young, there is simple surface irrigation; but as the crop grows, it is banked up, and the tiles are covered, and thus sub-irrigation follows. When the Celery is harvested, the tiles are dug out. Potatoes and various other crops can be grown in the same manner. One is able to water twenty times as much space by pipes as by the ordinary method with ditches.

Where irrigating is to be done on a large scale, it seems to be the general opinion that surface irrigation by means of furrows is undoubtedly the most practical method.

With regard to the storage capacity of soils, when they are thoroughly loosened up, the amount of water which they will hold is greatly

* "Recent Progress in the Study of Irrigation," *Bull. of the Bot. Dep., Jamaica, Jan., 1901, vol. viii., pt. 1., p. 2.*

increased, and the rise of water to the surface and evaporation are checked. It is only necessary to carry out subsoil ploughing when there is a hard and dry subsoil.

It is probable that the increased yields on subsoiled lands are mainly, if not entirely, due to the increased amount of water which such land is able to store up for the use of the crop.

In the April number of the same Journal there is a continuation of this subject under the heading, "The Conservation of Soil Moisture and Economy in the Use of Irrigation Water," by Messrs. E. W. Hilyard and R. H. Loughridge.

The authors first refer to the fact that the amount of water required by crops is from 300 to over 500 tons on the average to produce one ton of dry vegetable matter. The successful growth and bearing, especially of deciduous trees, without irrigation, despite a drought of five or six months in Middle and South California, has led to the impression that a smaller amount of water may suffice under arid conditions; for in the Eastern States as many weeks of drought and intense heat would frequently suffice to destroy the crop.

The main cause, however, is the great depth to which the roots go in arid climates. Not only can they reach a permanent source of supply, but the roots are withdrawn from the injurious effects of the hot, dry surface and air. On the other hand, a typical Eastern tree-root will stand in absolute need of frequent rains or irrigation to sustain its vitality.

The practical result is that it is to the farmer's interest to favour to the utmost the deep penetration of the roots, both in the preparation and tillage of the ground and in the use of irrigation water; for if the latter be used too frequently or too abundantly, the salutary habit of deep rooting will be abandoned by the plant, and it will, as in the East, be dependent upon frequent rain or irrigation.

The evil results in California of practising what is done in the Eastern States—viz., the shallow ploughing—is the production of a "plough-sele," which prevents penetration, and limits the range of roots for moisture and plant-feed.

Grape-vines which bear some of the choicest raisins of Malaga on the arid coastward slopes are made to supply themselves with moisture without irrigation, by opening around them large funnel-shaped pits, which remain open in winter, so as to catch the rain, causing it to penetrate downwards along the tap-root of the Vine, in clay shale quite similar to that of the Californian coast ranges, and like this latter, almost vertically on edge. Yet on these same slopes scarcely any natural vegetation now finds a foothold.

It is this deep penetration to the natural moisture which enables the small quantities supplied to produce marked effects.

This method of "basin" irrigation round the trees has been sometimes injurious to fruit-trees, in consequence of the chill to the earth round the roots. The water should be then "reservoired," so as to allow it to warm before being applied, so that furrow irrigation has been adopted in orchards; and it is for the fruit-grower to determine which consideration should prevail in a given case. But if the water supply be scanty and warm, the most effectual use that can be made of it is to apply it immediately around the trunk of the tree, in a circular trench dug for the purpose.

The authors then consider the power at the command of the farmer on an arid soil of utilizing the subsoil as a storehouse of winter rains, as the run-off from the surface is mostly a dead loss. So that a thorough knowledge of the nature of the subsoil to a depth of 4 to even 6 or 8 feet is most desirable; and the time it takes to wet his soil to a certain depth.

The next important point is, that, supposing the moisture to have reached the depths of the soil, the proper means must be employed for retaining it in the land, and to avoid loss by evaporation. This is best accomplished by mulching, and the best mulch for the purpose, which need not be hauled on or off, and is always ready, is a surface layer of loose, well-tilled soil. As the results on two soils adjacent to one another, one cultivated and the other not, the amount of moisture was as follows:—Average for depth (1 to 6 ft.) in cultivated, 6.3 per cent.;

ODONTOGLOSSUM CRISPUM

VAR. SIBYL.

OUR illustration (fig. 16) represents one of Mr. Norman Cookson's successes in the raising of Odontoglossums. A plant in flower was exhibited by him at the Royal Horticultural Society's recent exhibition at Holland House, and the flowers as seen on that occasion showed a close affinity with those of *O. crispum*, with indications of relationship with *O. Wilckeanum albens*. They have a white ground heavily blotched with claret-purple.

FIG. 16.—ODONTOGLOSSUM CRISPUM VAR. SIBYL.
(Photograph by Mr. Chapman.)

in uncultivated, 4.2 per cent. The average in tons per acre of water was, in the former, 756; in the latter, 572.

The cause of this difference in the number of tons was that in the uncultivated field there was a compacted surface layer several inches thick, which forcibly abstracted the moisture from the substrata and evaporated it from its surface; while the loose surface soil on the cultivated ground was unable to take any moisture from the denser subsoil. Besides, the tilled surface soil forms a non-conducting layer protecting the subsoil from the sun's heat and the dryness of the air. *George Henslow.*

NOTICES OF BOOKS.

LES PLANTES DE MONTAGNE DANS LES JARDINS, par Georges Magne. (Paris: Rue de Grenelle, 84 bis.)

ON the outskirts of Paris the author has constructed an alpine garden stocked with representatives of the Swiss and other mountain floras. Year after year the author visits the mountains to feast his eyes not only on the sublimities of the Alps, but also on the brilliant vegetation which clothes their base. He is not content with feasting his eyes, but he brings his intelligence to the aid of his observation, and by

careful study of the conditions under which the plants grow naturally is enabled to induce them to flourish under the very different conditions of the Bois de Boulogne.

In the little volume before us he tells the reader the secret of his success. Beneath his well-drained rock-work is a streamlet, which furnishes the moisture and coolness which the plants require, while the drainage prevents stagnation. He draws a distinction between "alpine" plants proper, which occur at the higher elevations exclusively, and "alpestral" plants, which occur on the low grounds and ascends the slopes of the mountains to a height of 5,000 to 6,000 feet only. As to the construction and management of the rock-garden, the author follows the directions of Mr. Robinson, M. Corveon, and others. His own experiments are worth recording, especially those in which he tells us how he sowed seeds of alpine Primroses and other plants in the autumn on the surface of the soil, which at the beginning of winter was covered over with a coating of snow, the seeds being in direct contact with the snow. In a fortnight's time seedlings of various Primroses, Gentians, Columbines, and others, made their appearance. On the melting of the snow, a thin layer of soil and chopped sphagnum is spread over the seed-pans, which are then placed in a frame. As a general result of his experiments, M. Mague says that he has proved the snow to be "an incomparable factor" in the germination of alpine plants.

A method of growing alpine plants, which is very suitable for town gardens, balconies, and situations where space is valuable, is to procure a wooden tub with a false bottom pierced with holes, over which is placed the soil. The space beneath the false bottom is filled with rain-water. By means of a funnel or inverted bottle kept filled with water, the level of the water remains constant, provision being made by an overflow pipe against the accumulation of an undue quantity of water. Each tub may be devoted to the flora of a particular district or to illustration of a particular genus, so that, for botanical purposes, this method of cultivation is very suitable, as the tubs can readily be carried from place to place. It is needless to say that the unsightliness of the tubs can be easily masked.

The latter part of M. Mague's little treatise is devoted to a descriptive list of the principal plants which can be cultivated in the rock garden.

We have said enough to show that this little work may be read with much interest and profit by those interested in "alpine" plants.

BULLETIN DE LA SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.

This annual publication of a prosperous and useful society is once more before us, and indicates in a striking manner what enthusiasm and ability can do. The President, Mr. Geo. Schneider, may well feel proud of the interest he has taken in those of his young fellow-countrymen who have come over to this country to learn English and perfect themselves in the profession they have chosen.

In size and form the Bulletin for the past year is the same as heretofore, and its contents are equally interesting. Among the illustrations there is an excellent frontispiece, a portrait of the late Charles Maries, accompanied by a short biographical sketch. Lists of the various officials, both in London and Paris, follow; then lists of the various grades of members composing the society, among whom we notice many who are famous in the horticultural world on both sides of the Channel. The names of the corresponding societies are given, and also details of the monthly meetings, at which papers are read by the members. Of these some are given *in extenso*, showing that the youthful authors are aspiring to still higher honours—a hope fully

justified when we look round and see the positions that many of these young men have occupied in the past, and will continue to do in the future.

The finances appear to be in a sound condition, the Library is growing, and the Report of the annual dinner proves that the Society's English supporters are in strong sympathy with its aims and aspirations. M.M. Madelin and M. Scalandris discourse upon the Chrysanthemum; M. Guillond upon Nepenthes; M. Henri Lemoine writes about the Botanic Garden at Tours; M. Leon Thoury upon propagation and culture of dwarf Roses at Orleans. Other authors include M.M. Schneider, Roth, Goddard, Charles, Aquatias, E. Thoury, Recordon, Boytard, Daumain, Nicolas, &c.

We notice a distinctly new departure in the Society's labours this year, and that is a visit on the 11th inst. to Mr. Peter Kay's establishment at Finchley, remarked upon on p. 47. It is to be hoped that such a visit is but the first of a series that will be made in the future. Much good feeling may thus be engendered between our Continental friends and English gardeners by acts of hospitality of this nature.

TREES AND SHRUBS.

The second part of Prof. Sargent's new work devoted to the illustration and description of new or little known ligneous plants has lately appeared. It is, as we have previously stated, of 4to size, with lithographic illustrations prepared mostly from material at the Arnold Arboretum, Boston, U.S.A. As many of the species are described from dried specimens, and some come from Mexico, Guatemala, and other warm climates, it must not be thought that they are in all cases likely to be hardy, either in the Northern United States or in Britain. Numerous new species of *Cratægus* are figured, the illustrations being the more valuable from the difficulty of otherwise determining the species. *Cratægus speciosa* is a handsome species which we may hope to see in cultivation. Its large flowers, brilliant crimson fruits, and shining ovate, oblong, serrulate leaves are very attractive.

Malus Sargentii, a Japanese species introduced to cultivation by Prof. Sargent, has proved quite hardy, and bears each year a profusion of pure white flowers, followed in autumn by attractive bright red fruits about 1 cent. across. Some of the leaves are entire, others more or less pinnately lobed.

Eriolobus Tschonoskii of Rehder is said to grow into a handsome tree of narrow pyramidal habit, especially beautiful in autumn, when the foliage assumes brilliant orange and scarlet tints. It is a native of the mountains of Japan, and is hardy at Boston. It was formerly known as *Pyrus Tschonoskii*. *Ribes fasciculatum* of Siebold and Zuccarini, comes also from the mountains of Japan and northern China. "The bright scarlet fruits, which remain on the branches for a long time, and do not begin to shrivel until the middle or end of November, make the shrub very attractive in autumn."

Various species of *Cornus*, *Viburnum*, and *Lonicera* are mentioned, most of which will be handsome additions to our shrubberies. *Tecoma hybrida* is stated to be a hybrid between *T. radicans* and *T. chinensis*. As a garden plant, *T. hybrida* is valuable, for its flowers are almost as large and showy as those of *T. chinensis*, and it is hardier than that species. It was described in the *Jardin* for 1899, and the description was quoted in the *Garden* of the same year. Its intermediate character is well shown in the illustration on plate 47 between flowers of its parents. *Picea morindoides* of Rehder, tab. 45, seems to be very close to *P. Alcockiana*, but is said to differ in its more elongated cone-scales, in its more slender and longer leaves with stomata only on one side, in the absence of pubescence on the leading shoots, and in the pendulous branchlets.

Our limitations as to space do not permit us to extend our remarks on a publication of very high value to all interested in trees and shrubs.

The Week's Work.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bicton, Budleigh Salterton, Devonshire.

Cyclamens.—Plants of a year old which the gardener intends to flower again should have most of the soil shaken from the roots and be repotted into similar-sized or larger pots. Afterwards place them in a cold frame or pit, and in close proximity to the glass, and afford but little water until the beginnings of growth are visible. Syringe the pots morning and evening, which will almost suffice for the present. Keep the frame, &c., close and shaded from bright sunshine for a few weeks, and, when growth has started, afford air, increasing the amount gradually. The after-treatment is the same as that afforded seedlings raised in the autumn. These last will now be growing freely in frames, and they should be afforded water with much care, and a light sprinkling several times daily in bright weather. Should thrips or green-fly appear on the plants, apply XL-All immediately. If larger plants than ordinary are desired, let the more robust seedlings be selected, which shift into 6-inch pots, using the kind of compost given in my Calendar for April 25.

Euphorbia pulcherrima (*Poinsettia*).—Let the young plants as they become fit be transferred into 5-inch pots, and after one week passed in gentle warmth, place them together with the cut-back plants in cold frames, and afford full ventilation on bright days, closing the lights about 4 P.M., after giving the plants a light syringing. As regards shade, the less the better, as the growth should be firm, short-jointed, and well-ripened. The plants which have been cut back may be afforded pots 2 inches larger than those they are standing in, if they are pot-bound at this early date, using a soil similar to that employed for *Cyclamen*, except that it should contain a small quantity of peat. The manure of deer, sheep, or fowls, if decayed, should be much diluted with clear water, and afforded the plants when the pots have become filled with roots. A like treatment is applicable to *Euphorbia jacquiniæflora*. Cuttings of the tops of aged plants of the latter are by some gardeners struck during the next few weeks; for details of the same see p. 4 of the present volume.

The Plant Stove.—The outer temperature being high during the day, and that of the night not falling below 50°, many of the occupants of this house may be transferred to the conservatory or greenhouse, where they may remain for two months, especially such plants as *Codiaeums*, *Dracænas*, *Acalyphas*, &c., which will be thrown away to make space for young plants. Such plants may be made presentable for some weeks longer by keeping them away from direct draughts and not very wet at the root. Many gardeners apply no fire-heat to the plant-stove for a month or two from this date, but I like to have the pipes slightly warmed during the night, banking down the fire the first thing in the morning, unless the weather should be overcast or rainy. Keep the air moist in bright weather.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury.

Cattleyas.—In the *Cattleya*-house proper plants will be found in all stages of growth, and where there is only one house it is not an easy matter to apply the required treatment to all the plants in it. If the house is of some considerable length, and there are several divisions, the gardener has better means of treating the plants in the manner they require at the various stages of their growth. Then he can set apart one division for plants newly potted, closer and more heavily shaded, while those that are established and growing freely can be afforded full light and much ventilation; as for example, plants of *Cattleya labiata*, *C. Trianaei*, *C. Harrisonæ*, *C. Bowringiana*, and other species, also hybrids which were repotted some time ago, which are now well established and growing freely, should be afforded such position as that I have indicated, and be afforded plenty of water at the root until growth is finished for the year. C. War-

neri, C. Gaskelliana, and C. gigas will have finished flowering generally, and should occupy a position similar to the foregoing, but water must still be afforded, as growth at the root is still going on. When the growths are matured much less moisture will be needed. Plants of the last-named species have not flowered freely this year at Westonbirt, owing, doubtless, to the lack of bright sunshine last summer, and as a consequence the pseudo-bulbs were less well matured than in previous years. If bright weather continues this summer the plants will pass through the winter safely, and afford strong flowering growths in the spring. C. Dowiana, and its variety C. D. aurea, require a kind of treatment similar to that which is found to suit C. gigas. These plants so far have a more promising look, most of the growths now developing having visible flower-sheaths; and a close inspection must now be made for signs of "rot" at the base of the pseudo-bulbs. It sometimes happens that the outer sheath of the new pseudo-bulbs, more especially near its base, clings so firmly to it as to prevent the air entering, and as a consequence moisture lodges between the sheath and the pseudo-bulb. The only remedy for this is to split the sheath from the top to the bottom, in order to evaporate the moisture. If this operation be delayed, there is a risk of the pseudo-bulb decaying. When this mishap occurs let the pseudo-bulbs be removed forthwith, and some charcoal-powder be rubbed over the wound. The same trouble is sometimes encountered with C. gigas and the beautiful hybrid C. Hardyana, when in the same stage of growth.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PIOTT, Bart., Wexham Park, Slough.

Cabbages.—It is good practice to make several sowings of Cabbage-seed for furnishing heads in the spring of next year; one sowing being made on or about July 24, again about August 15, and the last a fortnight later. The plants from the last sowing may be left in the seed-bed, and planted out in the spring. The seeds may be sown thinly in drills drawn at 1 foot apart, and should the soil be dry the drills should receive water several times before the seeds are sown. Before filling in the drills scatter finely-sifted wood-ashes over the seed-beds, and cover them with fish-netting as a protection against loss of seeds by birds. Ellam's Early, Wheeler's Imperial, Enfield Market, and Sutton's April, are valuable varieties of Cabbages to come in early.

Early Potatos.—The tubers being nearly matured may be lifted, sorted into those for consumption, which may be put into a cool dark cellar; and into sets for planting, which may be left on the ground for a short time to become green, and then stored thinly in a cool place, airy loft, &c. The ground occupied by these crops should be cleared of all rubbish, which, together with the tops, should be burnt, and preparation made for other crops.

Vegetable Marrows.—Cut the fruits when of small size for the table, as when allowed to produce seeds and develop to a large size the bearing capability of the plants is soon exhausted. Afford water abundantly at the root and overhead, and frequently apply liquid-manure. If black aphid infest the plants, syringe with soft-soap 3 oz., and water 1 gallon; and against mildew apply flowers-of-sulphur.

Parsley.—Make a liberal sowing of Parsley seed in a south border, and if the weather and soil be dry, apply water to the drills before sowing the seeds. Draw the drills at 1 foot apart. Thin the earlier sowings to 8 to 10 inches apart, and ply the Dutch hoe between the rows. Afford soot-water frequently in dry weather to plants in active growth, and to Parsley just coming through the soil apply finely-sifted wood-ashes and soot late in the evening or early in the morning.

General Remarks.—The various crops that have been mulched as advised will have benefited greatly during the recent hot weather, and the gardener will have been saved much labour by not having to afford so much water to the plants. In the absence of abundant rain, clean water and manure-water should be copiously afforded to Peas and French and Broad Beans in bearing, to

young growing Cauliflowers not as yet forming heads, Onions, and the like; and keep the surface-soil in a crumbly state by the use of the hoe, this being as good as a mulch for conserving moisture in the land. Water should if possible be applied late in the day. If the gardener can find the time and labour required to syringe or hose his vegetable crops at the end of hot, sunny days, these will be much benefited thereby. Let all spent crops be cleared off the land without loss of time, and all kinds of refuse likely to afford breeding material for insects, or to propagate fungus injurious to plants, be burnt forthwith.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Pruning.—Pear and Plum trees growing in whatever position should now have all side-shoots removed from the main branches, the leading shoots being allowed to grow on untouched till the end of next month. The side-shoots should be broken off by pressing them against the knife blade with the thumb of the hand grasping the knife, the snags being left at about 5 inches in length. These long snags should be shortened in the winter. Remove all useless spray so as to let the sunshine reach the main shoots. The pruning being finished, cleanse the trees of aphid, &c., with the garden engine. Apply water copiously to young trees planted in the autumn of last year should the rain prove scanty, and afford a mulch of stable litter. Where such early Plums as Victoria or Early Rivers are carrying heavy crops of fruit, thinning should now be commenced, and the fruits used in the kitchen. To such well-fruited trees water, and occasionally manure-water well diluted, may be applied at the root.

The Apricot.—In these gardens the trees have cast many of their fruits during stoning, and the crop is a poor one. Like all other stone fruits, the trees are making very vigorous growth. Remove all foreright shoots and laterals, the former being cut back to about 6 inches in length, and the latter pinched to the first or second leaf from the base. When laying-in the leading shoots the operator should proceed carefully, the wood being very brittle; and a nail driven into the brickwork and some soft Russian bast are the better for the securing of these shoots than cast wall-nails and shreds.

The Morello Cherry.—The black-aphid is again infesting the shoots of the Morello Cherry, to destroy which the points of the shoots should be dipped into a vessel holding a mixture of Quassia extract and water. Many of the fruits are dropping off, and I fear the crop will be a poor one.

FRUITS UNDER GLASS.

By T. H. C.

Late Vineries.—Thin bunches which appear likely to become overcrowded with berries, and as a consequence will not keep in good condition for any length of time, more especially called for if the Grapes are to be cut and placed in bottles of water. As only perfect bunches are suitable for this purpose, the Vines should be rather under-cropped than otherwise, so that the crop may finish properly. Make allowance for varieties having large berries, removing berries that might crowd the bunches unduly. Let lateral growths be pinched weekly, and afford to Vines bearing full crops liquid manure or special manure at such times as moisture at the root is required. Afford humid conditions in the vinery, and air as advised in previous Calendars.

Shading.—During bursts of strong sunshine Vines which are carrying fruit at various stages of development, especially ripe black Grapes, will be benefited by being shaded by a thin coat of whiting- and -water applied to the roof by means of a syringe; or instead, a double thickness of herring-net stretched across the roof will answer the purpose.

Tomatos.—The present is a suitable time for sowing seeds and raising plants for fruiting in pots during the winter. A good winter fruiting variety is Ham Green Favourite. Place the seed-pots in a cold pit or frame, afterwards potting them on, and growing them in an unheated pit, standing the plants close up to the glass.

Pot Strawberries.—The earlier layered runners being well rooted may be detached from the plants, and the pots stood close together in a cool shaded spot until they have recovered from the check of removal. These layers may then soon be potted for early forcing in 5-inch pots, and for later work 6½-inch pots. The pots should be new or well cleansed, and must be well crocked. The best kind of compost consists of turfy-loam one year in stack, roughly chopped, to every barrow-load of which a 6-inch potful of bone-meal may be added, together with a small quantity of fresh soot, charred garden refuse, and finely broken mortar-rubble, more or less of the last two according as the loam is heavy or light. Pot firmly, using a rammer, allowing ample space for the reception of water, and taking care to keep the crown of the plant slightly above the soil. Let the pots stand in coal-ashes in an open spot, and allow plenty of room. Apply water carefully, and sprinkle the foliage with water morning and afternoon. Continue to layer runners. Vicomtesse Hericart du Thury, Royal Sovereign, and Scarlet Queen, are excellent for forcing purposes; and for a late variety of most excellent flavour, though deficient in colour, British Queen is one of the best.

THE FLOWER GARDEN.

By J. C. TALLACK, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

The Budding of Rose Stocks.—The maintenance of a good stock of young and vigorous plants is an important point in the cultivation of Roses, as then the gardener is enabled to discard annually numbers of old worn-out plants. One often observes in gardens standard Roses which ought to have been thrown to the rubbish-heap years ago, growth being weak and flowers comparatively few and of poor quality. By planting a sufficient number of Briers to meet the demand, and budding these annually, the expense of keeping the stock of Roses in vigorous health is small. I alluded a week or two ago to the necessity for disbudding the Brier stocks, and retaining a sufficient number of well-placed shoots, which should now be budded. The art of budding is pretty well known, but some gardeners do not carry out the operation in the best manner, a common fault being to insert the buds at too great a distance from the Brier stem, instead of close to it; and while firm binding is very essential, the pressure should be regular throughout the length of the bud, and not so great as to force the ligature into the bark whilst that is taking place. The bud and shield should be fastened to the shoot in such a manner that the binding material will not slip down and cover the bud itself. In preparing stocks for the reception of buds be careful not to injure the wood, an important point when making the cross-cut at the top of the slit. If the bark of Rose or Brier does not "run," it is imperative that operations be deferred till such time as the sap flows more abundantly, a state of things hastened by affording water copiously to both Roses and stocks. The best buds are usually formed on shoots that have borne flowers the current year. Dwarfing stocks should be budded below the surface level, so that the point of union will be beneath the surface of the soil when replanted. Remove but few shoots having buds at one time, and cover the shoots with wet moss while carrying them; or place them in a watering-pot having water in it, or their freshness will soon be lost.

Carnations.—Seedling border Carnations, if the fertilisation has been carefully performed, afford splendid returns; and the plants are proof against the various diseases to which Carnations raised from layers are liable. There is still time to raise plants this year, provided the seeds be sown forthwith in well-prepared boxes of soil, and these are placed in cold frames.

Bulbs in Grass.—I recommended some weeks ago the planting of Daffodils and Narcissi in grass generally, but in some gardens planting has to be deferred till the hay crop has been mowed. It is not too late, if planting be done forthwith.

Lawns.—Coarse Grasses or bents are untouched by the mowing machine, and the scythe must be employed now and then, bents giving the lawn an untidy appearance if left uncut. As autumn approaches these grasses give less trouble.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	JULY 20	Bedale Rose Society's Exhibition.
TUESDAY,	JULY 21	Royal Horticultural Society's Committees meet. Lecture on "New Zealand Horticulture." National Carnation & Picotee Society's Show at the Drill Hall, Buckingham Gate, Westminster; Tibshelm Rose Show.
WEDNESDAY,	JULY 22	Northumberland, Durham, and Newcastle Botanical and Horticultural Society's Exhibition at Newcastle (three days); Cardiff and County Horticultural Society's Show (two days); Horticultural Show at Feltham (Middlesex).
FRIDAY,	JULY 24	Royal Botanic Society's Lecture. Rose and Horticultural Show at Halifax. Southern Counties Carnation Society's Exhibition at Southampton.
SATURDAY,	JULY 25	Saltire Rose and Horticultural Show.

SALES FOR THE WEEK.

TUESDAY, JULY 21—The Freehold Property known as "The Gardens," Bepton, near Bury St. Edmunds, with two Dwelling Houses, Greenhouses, &c., at The Mart, E.C., by Protheroe & Morris, at 2.

FRIDAY, JULY 24—Imported Orchids, by order of Messrs. Sander & Son; also private collection and consignment of *Phalenopsis amabilis* Rimestadiana, at Messrs. Protheroe & Morris' Central Sale Rooms, 67 & 68, Cheapside, E.C.

TENDER.

For Bulbs for Parks and Gardens, for the London County Council.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—63.4°.

ACTUAL TEMPERATURES:—

LONDON.—July 15 (6 P.M.): Max. 76°; Min. 53°.

July 16 (Noon): Rain; 67°.

PROVINCES.—July 15 (6 P.M.): Max. 72°, Southern Counties; Min. 54°, N.E. Scotland.

Standard fungicides.

WHEN first the practice of using fungicides and insecticides was introduced from

France and America, we did our best to make "spraying" and its results known to our readers, and to urge them to make a trial of the remedies which had been found so efficacious as a preventative or as a cure elsewhere. For a long time we seemed to be preaching to deaf ears. One great difficulty we experienced was owing to the inertness of our manufacturers, whether of spray-pumps or of substances wherewith to spray. We could get little or no information from them on these points, and had even to send out to Canada to get particulars as to "London-purple" and "Paris-green." It is somewhat strange that our services were recognised in America, the very country from which we derived a large portion of our information. Spraying should be regarded as an insurance, but it requires to be done with intelligence and judgment, and at certain definite times, else it may do more harm than good; and the operator must

always remember that he is dealing with deadly poisons, and should exercise due caution accordingly. Spray pumps and other needful apparatus, at one time difficult to procure in this country, may now be got here as well as in France and the United States. The necessary materials may also be had here, but there is a want of a definite standard of strength, and generally of precision as to the details which Mr. STRAWSON, in a little book before us, has endeavoured to supply. He sets his face against popular names as misleading and vague, and is equally emphatic about our stupid weights and measures. Having made his meaning clear he passes on to the description of several of the most commonly used fungicides and insecticides, indicates their percentage, composition, and the best methods of employing them. To those who are unable to procure the late Mr. LODGMAN'S exhaustive work, *The Spraying of Plants* (MACMILLAN & Co.), we commend the smaller publication of Mr. STRAWSON, which contains many serviceable formulas for the manufacture and use of these substances.

Here also we must mention the issue by the Orange Judd Company, of New York, of the fourth edition of Dr. CLARENCE WEED'S *Spraying Crops: Why, When, and How*, a little manual prepared for the purpose of aiding owners of spraying-machines to use them to the best advantage. We are still so often asked to describe the composition and method of manufacture of Bordeaux Mixture that we deem it advisable to extract the full directions given by Dr. WEED.

"Where the mixture has been properly made, there is scarcely any settling after an hour, while the improperly-made mixture has settled more than half.

"Briefly, the best results have been obtained from the use of the Bordeaux Mixture made in accordance with the following directions:—In a barrel or other suitable vessel place 25 gallons of water. Weigh out 6 lb. of copper sulphate, then tie the same in a piece of coarse gunny-sacking, suspend it just beneath the surface of the water. By tying the bag to a stick laid across the top of the barrel, no further attention will be required. In another vessel slake 4 lb. of lime, using care in order to obtain a smooth paste, free from grit and small lumps. To accomplish this it is best to place the lime in an ordinary water-pail, and add only a small quantity of water at first—say a quart or a half. When the lime begins to crack and crumble and the water to disappear, add another quart or more, exercising care that the lime at no time gets too dry. Towards the last considerable water will be required, but if added carefully and slowly, a perfectly smooth paste will be obtained, provided, of course, the lime is of good quality. When the lime is slaked, add sufficient water to the paste to bring the whole up to twenty-five gallons. When the copper sulphate is entirely dissolved and the lime is cool, pour the lime milk and copper sulphate solution slowly together into a barrel holding fifty gallons. The milk of lime should be thoroughly stirred before pouring. The method described insures good mixing, but to complete this work the barrel of liquid should receive a final stirring for at least three minutes with a broad wooden paddle. The copper sulphate solution should be poured into the lime, rather than the lime into the copper sulphate solution. It is now necessary to determine whether the mixture is perfect—that is, if it will be safe to apply it to tender foliage. To accomplish this, two simple tests may be used. First, insert the blade of a penknife in the

mixture, allowing it to remain there for at least one minute. If metallic copper forms on the blade, or, in other words, if the polished surface of the steel assumes the colour of copper plate, the mixture is unsafe and more lime must be added. If, on the other hand, the blade of the knife remains unchanged, it is safe to conclude that the mixture is as perfect as it can be made. As an additional test, however, some of the mixture may be poured into an old plate or saucer, and while held between the eyes and the light, the breath should be gently blown upon the liquid for at least half a minute. If the mixture is properly made, a thin pellicle, looking like oil on water, will begin to form on the surface of the liquid. If no pellicle forms, more milk of lime should be added.

"The foregoing directions apply to cases where small quantities of the mixture are needed for more or less immediate use. If spraying is to be done upon a large scale, it will be found much more convenient and economical in every way to prepare what are known as stock solutions of both the copper and lime. To prepare a stock solution of copper sulphate, procure a barrel holding 50 gallons. Weigh out 100 lb. of copper sulphate, and after tying it in a sack, suspend it so that it will hang as near the top of the barrel as possible; fill the barrel with water, and in two or three days the copper will be dissolved. Now remove the sack, and add enough water to bring the solution again up to the 50-gallon mark previously made on the barrel. It will be understood, of course, that this second adding of water is merely to replace the space previously occupied by the sack and the crystals of copper sulphate. Each gallon of the solution thus made will contain 2 lb. of copper sulphate, and under all ordinary conditions of temperature there will be no material recrystallisation, so that the stock preparation may be kept indefinitely.

"Stock lime may be prepared in much the same way as the copper sulphate solution. Procure a barrel holding 50 gallons, making a mark to indicate the 50-gallon point. Weigh out 100 lb. of fresh lime, place it in the barrel, and slake it. When slaked, add sufficient water to bring the whole mass up to 50 gallons. Each gallon of this preparation contains, after thorough stirring, 2 lb. of lime. When it is desired to make Bordeaux Mixture of the 50-gallon formula, it is only necessary to measure out 3 gallons of the stock copper solution, and after thorough stirring, 2 gallons of the stock lime; dilute each to 25 gallons, mix, stir, and test as already described. One test will be sufficient in this case. In other words, it will not be necessary to test each lot of Bordeaux Mixture made from the stock preparations, provided the first lot is perfect, and no change is made in the quantities of the materials used. Special care should be taken to see that the lime-milk is stirred thoroughly each time before applying. As a final precaution it will be well to keep both the stock copper sulphate and the stock lime tightly covered. Care should be taken that there is always some excess of lime.

"Cautions.—Most of the copper compounds corrode tin and iron. Consequently, in preparing them for use, earthen, wooden, or brass vessels should be employed, and in applying them the parts of the pump which come in contact with the liquid should be made of brass.

"Always label all poisonous preparations in plain large letters, POISON. Never leave poisonous compounds within the reach of children, ignorant persons, or domestic animals. Never spray trees in blossom. In using a compound with which you have had no experience, and which is reported as at all liable to injure foliage, use only weak mixtures, and, if possible, try its effects first on a small scale. Own a spraying-pump yourself. If you have to wait to borrow

your neighbour's, the chances are that you will begin too late.

"Spray in time; begin early; do not wait until the horse is stolen, and then try to lock the door by spraying. Do not spray indiscriminately anything and everything. Adapt your means to your ends. Study the enemies of your crops, and then fight them intelligently.

"Of two mixtures equally effective, choose the one least liable to injure foliage. Take the trouble to add a little lime to Paris-green or London-purple mixtures.

"Never spray ripening fruit. Always remember that spraying requires the exercise of skill, judgment, and knowledge, to get the best results."

THE ROYAL HORTICULTURAL SOCIETY.

The next meeting of the Royal Horticultural Society will be held at the Drill Hall, Buckingham Gate, Westminster, on Tuesday, July 21, from 1 to 6 P.M. In connection with this meeting, the National Carnation and Picotee Society will hold its Annual Show. Instead of the subject previously announced, the lecture will be on "Horticulture in, and the Flora of New Zealand," by G. HUNT, Esq.

LILY "PETER BARR."—Messrs. BARR & SONS send us a large flower of a variety of *L. elegans*, some 7 inches across with recurved oblong segments, the inner narrowed at the base into a short stalk, all deeply furrowed on the upper surface, and with a few purplish spots. In colour the flower is distinct from any form that we remember, being of a peculiar shade of yellow-orange, and very bright.

FRUIT IN EASTERN EUROPE.—Intelligence has been forwarded from Serajevo (Bosnia Serai) that the Plum trees in Bosnia escaped the frosts in early April, and promised a short time since to give a good average crop. From Herzegovina we learn that the Walnut, Vine, and Fig suffered severely.

TEN-WEEK STOCKS.—We have received a collection of varieties of the Ten-week stock from Mr. FREDERICK ROEMER, Quedlinburg, Germany. The plants are very strong specimens, and the flowers generally large and bold. This is remarkable, because Mr. ROEMER informs us that the plants have been grown in the open ground, and the season has been much drier than usual. Although rain has been needed greatly, it was impossible to water the plants, their number being very great. All the varieties have pure white double flowers.

Dwarf German is described as the oldest strain of Ten-week Stock in existence. It is very free-flowering, and is said to produce a good percentage of double blooms.

Of the *Large-flowering type* there are several varieties. The type, and one called *Dwarf White*, are floriferous strains having a free branching habit and large flower-spikes. The *Wallflower-leaved variety* of this section failed to succeed well this season, but it is an attractive variety by reason of its bright green foliage.

Victoria Bouquet branches out very freely, and forms neat, almost perfect specimens. It is recommended for planting in beds, and particularly for cultivation in pots.

Giant Perfection is one of the best summer Stocks. The plant is uncommonly fine, and the flower-spikes and blooms of extra size and good form. It branches freely.

Large Flowering Globe Pyramidal.—A very strong-growing variety, producing large flower-spikes and blooms. Pyramidal in shape, but the plant branches from the base in less degree than others.

Perpetual Perfection.—A strong-growing variety of free-branching habit, about 1½ ft. high. It is

said to bloom uninterruptedly from June until November.

Mammoth White Column, or Excelsior.—A variety that grows 3 feet high, and produces only a single flower-spike. This is studded closely with large flowers of excellent form. The variety, and another known as *Giant Perfection*, are amongst the earliest to flower.

THE "MOSQUITO PLANT."—Sir GEORGE BIRDWOOD lately wrote to the *Times* on this plant. There are known commonly in India several species of "Tulsi" (*Ocimum*), but the best known are "Ram Tulsi" (*O. gratissimum*), "Babui Tulsi" (*O. pilosum*), "Krishna Tulsi" (*O. sanctum*), and the common wild "Tulsi" (*O. villosum*). The two latter are held sacred to Vishnu, and are used in his worship. It is recorded in the sacred books of the Hindus that Krishna assumed the form of Sankasura, and so seduced his wife, Brinda. When discovered, he manifested his extreme regard for her by turning her into the Tulsi plant, and put the leaves upon his head. This is the version given by Mr. D. L. RICHARDSON, Principal of the Hindu Metropolitan College, 1854, in his very interesting work, *Flowers and Flower Gardens*. He was indebted for his information regarding flowers commonly used in the religious ceremonies of the Hindus to BABU KASIPRASAD GHOSH, "the first Hindu gentleman who ever published a volume of poems in the English language." That the leaves of the Tulsi are used by the natives of India as a febrifuge has been known for ages, but its use as a "Mosquito Plant" has not been so generally known. It is well worth experimenting with. In connection with this subject we may mention that Messrs. CANNELL & SONS, up to date as usual, are offering seeds and plants in pots of the "Mosquito expeller."

THE RAIN AS A CLEANSING AGENT.—Some interesting facts regarding the purifying effect on the air of heavy rain are given in the *Lancet*. The writer says:—We have often pointed out that the passage of raindrops through the air not only purifies the air, but imparts a freshening effect to it, due possibly to an oxidising action, and perhaps to the formation of peroxide of hydrogen. Everyone is familiar with the "clean" smell of the air after a rainstorm. According to this view, the air of the county of London must have sustained a very thorough scouring during the remarkably continuous rainfall which began on Saturday, June 13. There was very little movement in the air, and an opportunity was thus afforded of collecting the water for analysis, the results of which would represent some at any rate of the impurities washed out of the air immediately over this area. The following were the results obtained with raindrops caught in the neighbourhood of the Strand on Monday, June 15:—

	Grains per gallon.
Total solid matters	9 107
Common salt	0 800
Ammonium sulphate	0 652
Organic ammonia	0 011
Soot and suspended matters	5 000
Nitrates	None
Nitrites	Very distinct

The amount of ammonia in the form of sulphate is remarkable, and of course its chief origin is the combustion of coal. The nitrites with traces of ammonia are due to electrical discharge in the atmosphere. These results, when worked out with the total rainfall, give some remarkable figures. Taking the rainfall as 3.8 inches in five days (though a higher figure than that has been returned by some observers), we arrive at the calculation, based on each inch representing 22,622 gallons of water falling upon one acre, and the London county acreage as 74,839, that no less than 6,437,229,860 gallons of water were poured over this area. And according to the above results of the analysis of the rain-water, this enormous volume represents the washing out of

no less than 3,738 tons of solid impurities, of which 330 tons consisted of common salt, 267 tons of sulphate of ammonia, and 2,000 tons of soot and suspended matters. Regarding the combustion of 1 ton of coal to produce 20 lb. of ammonium sulphate (a very fair average), the quantity of coal represented by the ammonium sulphate washed out by the storm would be 29,904 tons. It need hardly be added that the purification is not only, as is here shown, mechanical, physical, and chemical, but bacteriological also.

BOOK ON AMERICAN CARNATIONS.—Messrs. J. R. PEARSON & SONS, Lowdham Nurseries, Notts, notify us that they have been appointed European agents for the *American Carnation, and How to Grow It*, recently reviewed in our columns.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The usual monthly committee meeting of this Society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening, 13th inst., Mr. THOMAS WINTER in the chair. Four new members were elected, making sixty-one this year, the total membership now being 1026. Five members were reported on the Sick Fund. The Sick List has been unusually heavy during the last half-year.

THE CODLIN MOTH.—It is pitiable to observe how great is the peril of the small crop of Apples left on the trees in orchards and gardens, falling later on from the attack of that dire pest, the Codlin-moth, whose eggs were deposited on the fruits last month. The larvæ at the present time is making their way to the centre of the fruits, causing the latter to fall; and no amount of skill or management will prevent it occurring. We are pleased to learn that Mr. W. HORNE, of the firm of HORNE & SONS, Cliffe, who has been studying the life-history of this moth for several years, has, within the last few months, found a remedy. This he intends making known by reading a paper on the Codlin-moth at the September meeting of the National Fruit Growers' Federation.

COTTON CORNERS.—One of the means used by speculators in their operations is that well known as the "Cotton corner," the latest of which has just collapsed. Extending the area of culture would doubtless be a check on the practice, and in his last report on the condition of Cyprus the Governor suggests to Lancashire mill-owners the advisability of taking up land in the island, where the crop has already done well, and where the inhabitants are acquainted with the manipulation of plant and crop. The idea is well worth consideration.

GARDENER AT THE GROVE, WATFORD.—We learn that the post of head gardener to the Earl of CLARENDON, The Grove, Watford, has been taken by Mr. CHAS. HARRIS, who has been the foreman in charge for the past two years. Mr. MYERS, who has occupied the post for over forty years, is retiring on a pension.

THE HIMALAYAN POPPIES (MECONOPSIS) are exceptionally good in the rock-garden at Kew, where they are grown in a partially-shaded recess, with hardy Ferns and *Cypripediums* for their companions. Some of the stems are 5 feet high. The cool wet weather of the spring and the first half of June has evidently been to their liking.

POA ANNUA.—Some doubts have been expressed as to the possibility of obtaining seeds of this grass in quantities. We have before us a contract from a well-known firm undertaking to supply seeds of this grass at 6d. per lb. Moreover, we have the assurance that the seed was true to name. It is used in association with *Festuca duriuscula*, *Poa pratensis*, and *Cynosurus cristatus* on light, dry soils.

NATIONAL FEDERATION OF FRUIT AND POTATO TRADES ASSOCIATION.—If the services rendered to the traders be in proportion to the length of the title of the "Federation" or of the "Association" (which is it?) the advantages ought to be great. Mr. HENRY EMERY has been appointed Secretary, and offices have been secured at the Tavistock Hotel. The Federation is established to serve the interests of the members of the trade in the provinces and in the metropolis.

SCOTTISH HORTICULTURAL ASSOCIATION.—A copy of the *Transactions* of this Association is before us, containing, in addition to the bye-laws, the list of members, and other business details. These are, of course, quite necessary, but for the gardening public the reports of the papers read at the several meetings are of greater interest. We are not going to specify any one in particular, for they all appear to us to be of interest and value. In these days there is a positive plethora of Garden literature. Much of it is necessarily of ephemeral or of merely local interest; but the papers in this modest pamphlet may be read at any time, in any locality, with profit. We are glad to find that the members number more than 1,100.

POISONING FLOWERS.—It is reported, says the *Pharmaceutical Journal*, that considerable indignation has been caused in the district of Worsley, near Manchester, by the action of some person or persons in poisoning certain flowers in local gardens belonging to cottagers who take a great interest in horticulture and compete for prizes offered by the Worsley Agricultural Society. It is stated that last summer similar outrages were perpetrated in the same neighbourhood.

THE CONGO FLORA.—Our Belgian colleagues continue their active researches into the natural history of the Congo Basin. We have before us the first part of M. DE WILDEMAN'S *Etudes de Systématique et de Géographie Botanique sur la Flore du Bas et du Moyen Congo*, containing descriptions and lithographic illustrations, some coloured, of various plants collected on the Congo. Among them we find an account, with coloured plates, of two new Cycads, *Encephalartos Lemarinellianus* (DE WILDEMAN & DURAND), and *E. Laurentianus*, living plants of both of which have been introduced into Belgium by M. L. GENTIL, so that we may hope shortly to see them also in this country.

PRESENTATION.—Mr. SCLATER, of Messrs. THOMAS METHVEN & SONS, Princes Street, on the occasion of his silver wedding, was the recipient of a solid silver tea service, with suitable inscription, from a large circle of friends in the local trade, and others. The presentation took place on Wednesday, 8th inst., in the Royal British Hotel, under the genial presidency of HARRY ERSKINE. Mr. WILLIAM NEWTON, wholesale fruit commission agent, made the presentation, and Mr. SCLATER in replying referred to the many changes that had transpired in the Edinburgh trade since he served his apprenticeship.

A SHOW IN BRITISH EAST AFRICA.—The last show of the Nacrobai Agricultural and Horticultural Society was a great success. Vegetables of every class, from a Cabbage to a Tomato, Potatoes, Wheat, Barley, Oats, Buckwheat, Maize, Millet, Sim-sim Beans, Ground Nuts, Copra, Grapes, Pineapples, Oranges, Pomegranates, Mangos, Strawberries, Figs, Bananas, and many garden flowers, showing what can be got together by a spirited company. It would appear that much of the soil is of volcanic origin, and that the land has only to be tickled to be made to smile.

ALYSSUM SPINOSUM.

UNDER the heading of "Alyssums" there is an article in the *Gardeners' Chronicle* for June 20, 1903, p. 386, by Mr. Arnott, in which I was much interested, because of the description he gives of the habit and history of *Alyssum spinosum*, which is so strangely at variance with its behaviour with me. I send you with this a photograph of a plant now growing in my rock-garden (see fig. 17), which has been there for about nine years, and shows no sign of failing yet. Every year it is smothered in white blossom, almost entirely concealing the foliage, and though at the time this photograph was taken a good deal of the bloom had fallen, and it hardly shows its full glory, enough is left to prove its value on account of its bloom, as well as its charming foliage. All my plants of *A. spinosum* act in this manner, and they seem able to survive and take care of themselves perfectly, and I should certainly class them as among the very hardiest and most satisfactory of plants that I know for rock-work. I fancy there is a great difference between its behaviour here and in the North of England, as when I lived in

FIG. 17.—ALYSSUM SPINOSUM, FROM THE GARDEN OF S. MARSHALL BULLEY, ESQ., HASLEMERE.

Cheshire I never got much bloom from the plant, whereas here it never fails to bloom.

I have just measured this plant, and find it is 6 feet by 5 feet in width, and about 15 inches above the soil in which it is planted. *S. Marshall Bulley, West Down, Hindhead, Haslemere.*

LAW NOTES.

"EMPTYES."

SITTING in the Westminster County Court, his Honour, Judge Woodfall, tried the case of *Monro v. Theobald*, in which plaintiff, Mr. Geo. Monro, a fruit salesman, of Covent Garden Market, sued defendant, a produce grower of Durrington, Worthing, Sussex, to recover the sum of £14 5s. in respect of empties supplied and not returned. Mr. Lever, instructed by Messrs. J. C. Eutton & Co., solicitors to the London Fruit, Flower, and Vegetable Markets Association, Ltd., was counsel for plaintiff, and said the question at issue was one of the greatest importance to salesmen in Covent Garden Market, involving, as it did, the return of empties supplied to growers for the purpose of sending their goods to Covent Garden. The empties in question comprised what were known as "flats," which were charged at 2s. each; "baskets" at 1s. each, and "boxes" at 1s. each, the claim in the present case being in respect of empties which had been sent to defendant and never returned.

The defence raised by the defendant was that he objected to the claim on two grounds. In the

first place he considered plaintiff's claim was excessive, and in the second he contended that empties for which he was being charged were either in a damaged condition when they left plaintiff's premises, or were broken up in the course of transit on the railway.

Mr. Henry Gentry was called, and said he was forwarding clerk in the plaintiff's employ, and his books showed that the empties in question were forwarded to the defendant, and had never yet been returned.

Mr. Sams, a grower, was called, and said he had occasion to go to the defendant's place on business, and although he was quite disinterested in this action, he did not fail to notice that a number of plaintiff's empties were lying rotting outside greenhouses, and were not in any way protected from the weather.

In cross-examination by the defendant, the witness said he was extremely particular as to the return of empties, and always advised other growers to adopt the same course. He absolutely denied, however, that he ever made any suggestion to his fellow-growers to the effect that they would have to look after "Monro" on the question of empties.

The defendant said that, since he had done business with the plaintiff's firm, he had had thousands and thousands of empties supplied to him, and even if the plaintiff's claim was a good one, the amount which he now sought to recover would only represent a loss of about three per cent. on the bulk of goods supplied to him. He contended, moreover, that in many cases empties were in a damaged state when they left the plaintiff's place, and that a large number of them were broken up in the course of transit on the railway.

In giving judgment, his Honour said that inasmuch as the defendant was not legally represented, he had allowed him to say a good deal more than he would have done had he had the assistance of a lawyer. The burden of proof in this case was upon the defendant, but he had absolutely failed to prove any defence whatever to the action. The facts of the case were simple enough, although the question was undoubtedly one of the very greatest importance to Covent Garden salesmen. It was not denied that certain empties were supplied to defendant, and that they had never been returned to the plaintiff's firm. The question as to what became of them ultimately did not arise in this action, and therefore judgment must be given plaintiff for the amount claimed, with costs.

Mr. Lever applied on behalf of the plaintiff for costs on the higher scale in view of the very great importance of the case, and the character of defence which had been set up. His Honour said he had been considering as to whether he should give costs on the higher scale, more especially in view of the very unwarrantable suggestions which the defendant had put forward against the plaintiff's firm, but he was afraid he had no power to do so under the Act. Plaintiff's Counsel said his client would be perfectly satisfied with the observations which had fallen from his Honour.

TRADE NOTICES.

MR. D. S. GOLDING, for the last eighteen years with Messrs. Saltmarsh & Son, Chelmsford, has taken the Seed, Florist, and Bulb Business until recently carried on by Mr. W. H. Hudson, 199, High Road, Kilburn, London, N.W.

MR. T. G. FLANDERS, for the past ten years gardener to Andrew Motion, Esq., Upton House, Banbury, and Faulkbourne Hall, Witham, Essex, has taken over the Casterton Road Nurseries, Stamford, Lincolnshire.

NOLINA BELDINGII.

UNDER this name we have received a photograph of a Yucca-like plant from Lower California (fig. 18). The genus, closely allied to *Dasyliiron*, consists of perennials with a thick woody trunk often dilated at the base, and bearing above numerous linear, rigid, toothed leaves, surrounding a naked flower-stalk terminated by a many-flowered panicle intermixed with bracts. The perianth consists of six narrow, whitish segments. The plants are adapted to live in hot dry localities, as in the deserts of Mexico and Lower California, and are hence included under the heading "Xerophiles." Mr. Baker includes the genus under *Beaucarnea*. *B. longifolia*, *B. recurvata*, and *B. Georgiana* are recorded as being in cultivation, and have been figured in the *Gardeners' Chronicle*, 1870, 1445 (*B. recurvata*), and 1877, vii., 493 (*B. longifolia*).

N. Beldingii is described by Dr. Brandegee in *Bailey's Cyclopædia of American Horticulture*, vol. iii. (1901), p. 1092. As this book may not be accessible to all cultivators, we append Dr. Brandegee's description:—

"*N. Beldingii*, Brandegee.—Arborescent, branching freely; trunk columnar, 1—1½ ft. in diam., 8—15 ft. high; branches short, bearing numerous old and new leaves towards the end; leaves glaucous, a yard or more long, ¾ in. wide, flat, thin, tapering to the point, serrulate on margins, about fifty-nerved, weak and recurved; panicle compound, 6 ft. long or more; fruit emarginate; seeds round-ovate, not bursting the cells. Mountains of the cape region of Lower California. Apparently nearest *N. Bigelovii*, from which it differs in the thinner, more flaccid leaves, and the very much greater size. *T. S. Brandegee*."

HOME CORRESPONDENCE.

LATE PEACHES.—The systematic cultivation of the Peach late in the autumn does not receive the attention that it deserves. Peaches are undoubtedly favourite fruits at any season, but towards the end of the month of September or the half of October, and in fine seasons till early in November, when stone fruits generally have vanished, the importance of abundant and choice dessert fruit is highly appreciated. With regard to the commercial value of late Peaches, most gardeners agree that, taking the cost of production into consideration, the returns from a late crop is often more remunerative than any other. Some time ago, a gardener gave me an instance which illustrated this point—viz., that of an old widow residing in a southern county, against whose cottage a large Salway Peach-tree is planted, and who was in the habit of disposing of the fruits in the local market at a trifling price. My friend advised her to let him send the fruit to Covent Garden Market, with the result that a handsome sum was realised, considerably more than paid the old woman's rent for the year. It may be contended that late Peaches are lacking in fine flavour, and that this is further deteriorated by the absence of warmth and bright sunshine. This, of course, must be admitted; but the same argument holds good with other fruits that mature at a late part of the autumn. For example, who would think of growing Gros Colmar or any of the other coarse large Grapes for flavour alone, if higher-quality Grapes could be obtained at the same time? They are grown because showy Grapes must be forthcoming at that season. The same reasoning holds good with Peaches, and their scarcity in the autumn gives them an added zest. Late Peaches, when not eaten, can be employed as a compote. The earlier of the late varieties, if I may so use the term, viz., *Bellegarde*, *Barrington*, *Prince of Wales*, and *Late Devonian*, succeed on west walls; and this aspect enables the cultivator to secure a useful succession of fruits. The later varieties—*Princess of Wales*, *Gladstone*, *Lady Palmerston*, *Golden Eagle*, *Walburton Admirable*, and *Salway*—should be planted against a south wall, or there will be a difficulty in ripening and colour-

ing the fruits in ordinary years, especially so in the case of the *Salway*. In very late seasons, such as the present, it may be necessary to assist ripening by covering the trees betimes with some frame-lights, which at this season of the year are usually available in gardens. The best of the varieties before-mentioned, in the order of ripening, are the following:—*Bellegarde*, *Barrington*, *Prince of Wales*, *Princess of Wales*, *Gladstone*, *Osprey*, *Golden Eagle*, and *Salway*. *O. Thomas*.

POA ANNUA NOT A SELF-FERTILISER.—The Rev. Prof. Henslow having been so kind as to reply to my letter under the above heading in issue of June 13, it is now my duty to make rejoinder. He remarks that I did not allude to the exact period when the anthers first burst and shed their pollen. I have now carefully examined a number of open and opening florets, and find that the anthers dehisce very soon after the florets open, while the filaments are still erect. The anthers are as high as the tip of the lower pale, or higher, and are fully exposed to wind and breeze before they dehisce, in all the cases I have observed, so that pollen must be carried from them about as freely, I think, as in the case of other Grasses. Pollen, of course, may fall on the stigmas below, especially when the air is still;

FIG 18. NOLINA BELDINGII, S. CALIFORNIA, FROM DR. BRANDEGEE.

and it has not been my intention to say that self-fertilisation never takes place, because we commonly understand that cross-fertilisers frequently have that provision, and we know indeed that many cross-fertilisers have special flowers for the express purpose of securing self-fertilisation. I did not propose to show that *Poa annua* does more than most other grasses in securing cross-fertilisation, but the Professor himself provides me with the means of pointing out that whatever the case may be with other grasses, *Poa annua* must be a cross-fertiliser. He says, "The topmost spikelet is often female, and of course must receive a grain from some other floret." That the top floret and the second and third below in other cases may be female I may safely assert. I found a young inflorescence with five top female florets open, on as many spikelets, without a single male flower open, or anther near. It was in a female stage or condition, and the ten stigmas would be as likely to receive pollen from another plant as from their own. Supposing this inflorescence to have been the only one so far advanced on a young plant, it follows that pollen must come from another individual, if the florets are to be fertilised. We might assume that the stigmas could wait, but I think we are justified in assuming that female florets are open in advance by themselves for a purpose—that purpose being cross-fertilisation. The Professor refers to my touching the wider question of the "supposed" superior advantages of inter-cross-

ing. He says, "From a florist's point of view this is undoubtedly, but the stimulus is not permanent. I do not feel sure of the intended scope of this remark, but I cannot believe that plants are under one law when wild, and under another in the hands of the florist. I believe that the florist works in accordance with natural law, and no other. It is impossible to endow any plant with a responsiveness it does not naturally possess. The "stimulus" of cross-fertilisation, the Professor says, is not permanent; but there is no reason, I believe, why it should be, for the "stimulus" in feral nature is reapplied from time to time in all cases where it obtains at all. The Professor says that this question was settled a quarter of a century ago—i.e., that habitual self-fertilisers have the advantage over those that are cross-fertilised. That certainly, in my opinion from what I believe to be the usual point of view, is not the case, for there never was a time when cross-fertilising was looked upon more seriously as the great principle of plant-life. The key to the Professor's position is shown, I believe, in the *Transactions of the Linnean Society*, where he writes, "Now, as Mr. Darwin observes, self-fertilisation secures this end, that of producing seed, with incomparably greater certainty than by any other means." This, of course, is true, and it is not open to dispute; we remember this, whatever may be the argument in favour of cross-fertilisation. As it is true, there must be some supreme advantage in cross-fertilisation which stands on different ground. We observe that practically all the higher plants, and practically all animals without exception, are cross-fertilisers. All nature, therefore, may be said to adopt cross-fertilisation. I think we may assume that nature found, first of all, a stupendous advantage in a means of increase which necessitated the fusion or interaction of distinct cells (sexual increase), and has subsequently found, for the same reasons, still greater advantage in proportion to the dissociation of these distinct cells. I am well aware that there is nothing I can point out that the Professor does not know; but I differ from him in the line of my argument, and Müller's *Fertilisation of Plants*, and Kerner and Oliver's *Natural History of Plants*, "Autogamy," kindly pointed out to me, and which I know well, seem only to confirm me in it. Kerner says it must not be inferred that the only method of reproduction in hermaphrodite flowers is by autogamy. "It is true that cross-pollination appears to be the primary object aimed at, but it is not true that autogamy is avoided. If cross-pollination takes place, there is naturally no necessity for subsequent autogamy; but if cross-pollination fails, autogamy assumes an importance of its own, and the contrivances which have been observed to bring about autogamy are no less numerous than those which favour cross-pollination." If cross-pollination is the primary object aimed at, autogamy is but a substitute and a provision in the event of the failure of the more desirable method. *R. Irwin Lynch*.

POA ANNUA.—In the *Gardeners' Chronicle* for July 11, 1903, p. 26, Mr. D. McDonald remarks, "It has been stated several times recently that this species of grass is obtainable from seeds. As one who knows something of the grasses of commerce, I say this is incorrect." Your correspondent is usually so accurate, and is always such a pleasant writer, that I regret having to point out that his statement does not agree with my experience. I have repeatedly obtained seeds of *Poa annua*, quite true to name, and free even from an admixture of *Poa compressa* and *P. pratensis*, which Mr. McDonald mentions as the common substitutes. In some parts of Bedfordshire and Cambridgeshire *Poa annua* is the most troublesome weed in fruit plantations where the ground is cultivated. Seeds are produced so continuously and abundantly that it is only by repeated hoeing the land can be kept even moderately clean. In London and other large towns, I know many lawns that are formed almost entirely of this grass, and where it can be kept well watered in hot weather and is not subjected to much hard wear, it has a bright appearance. But it cannot be recommended for general use, as it dies off

quickly in hot dry weather, and does not form a dense permanent turf that will endure much traffic. *Poa pratensis* is an abundant constituent of the pastures in this country; but why does Mr. Donald speak of it as the Kentucky Blue-grass, when it is so much more generally known as the Smooth-stalked Meadow-grass? *Poa compressa* is also well known in many parts of Great Britain, but I have not observed it as frequent in this county; it is easily distinguished from *Poa annua*. As I have been studying and growing the principal useful and ornamental grasses during the past twenty years, your correspondent will understand that I am interested in the subject. *R. Lewis Castle, Ridgmont, Bedfordshire.*

SUMMER FLOODS.—I had often wondered at the sudden appearance in my Thames land, subject to flood, of the Elders, because if they were to cover the former Osier-beds, why had they not done so sooner? The mystery is now explained. There had been no summer flood since 1879. The recent summer flood has killed at once every Elder except some two or three out of several hundred, and possibly all. It has also killed almost every Lilac, and nothing else, unless it is one of the wild Brionies, as we call the less common of the wild creepers, which, with a large leaf, creeps from branch to branch among the Poplars on the river-side. Where I had Lilacs, Persian, red, and giant white, among the different kinds of *Philadelphus*, the Lilacs are killed out and the *Philadelphus* left unharmed. The Virginian Creepers seem to have suffered, but to have survived. The Austrian Briars have also suffered. Of course every annual is destroyed, but that is by mere movement of the roots and deposit of mud. I need hardly add that these Lilacs and Elders thus killed by summer flood had passed through winter floods year after year without harm. *C. W. D.*

THE LATE W. THOMPSON OF IPSWICH.—In your Obituary of "Thompson of Ipswich" you make no mention of him as an author. His Catalogues were always excellent reading; but besides these he published in 1851-2 the *English Flower Garden*, a monthly magazine of hardy and half-hardy plants, in quarto, illustrated. Two volumes only were published, but they were excellent; I have often found them very useful, and prize them highly. The descriptions are excellent, and the plates, though small, are very good. *Henry N. Ellacombe, Bitton Vicarage, Bristol.*

THE LIZARD ORCHIS.—It may interest your readers to know that the Lizard Orchis, which has so often been reported as extinct, still exists in Kent. I had the pleasure of seeing it in magnificent flower on July 10. The following day, in company with Mr. Davy, I had the good fortune to find a wild bush of *Rosa pomifera*, on the cliffs of the foreshore between Walmer and St. Margarets, far from houses. *George Druce.*

SIMETHIS BICOLOR.—One of the rarest wild plants in England, soon I fear to be extinct, has come to me this week from Bournemouth. It was discovered in 1847 by a Miss Wilkins growing profusely in a plantation on the Poole Road. She sent specimens to Dr. Lindley, to Charles Babington, and to Mr. Dennes, Secretary to the Botanical Society; and I possess the letters which they wrote in answer. It was pronounced to be the *Simethis bicolor* of Kunth; not native, introduced possibly with seeds of Pinaster from Western France. The Bournemouth of that date has been wiped out by the speculative builder. The spot in Branscombe where it still grows, not now profusely, is marked for the erection of houses during next year, and it can hardly escape destruction. Two plants have been sent to me, which I hope to rear and present to the Oxford Garden. Meanwhile it seems right to chronicle in your columns what is probably its last wild appearance on English soil. *Corycius senex.*

SAXIFRAGA RHEI SUPERBA.—I am indebted to Mr. Jenkins for giving his opinion of *S. Rhei superba*, which I had purposely omitted from my notes of the pink Saxifrages until I had flowered it in good condition. It reached me from the Continent in bloom, but the flowers were almost white, and I was afraid that it might be a dis-

appointment. Since then, however, it has produced fresh blooms, and these are exactly as Mr. Jenkins speaks of them, being the same colour as those of the typical *S. Rhei*, but larger, and produced on longer stems. As Mr. Jenkins remarks, the foliage of *S. Rhei superba* is larger than that of the type. *S. Arnott.*

SOCIETIES.

NATIONAL SWEET PEA.

JULY 15, 16.—The closing of the Royal Aquarium, Westminster, forced this Society to seek a new place for its exhibitions, and in consequence of this the third annual show, held on Wednesday and Thursday last, took place in the Prince's Hall, within the precincts of the Earl's Court Exhibition grounds. The Prince's Hall is very close to the entrance in Warwick Road, Kensington, and it proved to be much more agreeable than the Aquarium, there being no distracting noise or incongruous scenes. The building itself is bare of any adornment, however, and during the afternoon the atmosphere became exceedingly hot. Thanks to the Committee having forbidden the use of wire, the flowers that were in water lasted well, but the wreaths and crosses looked dreary objects in the course of a few hours. The exhibition was a very full one, and the quality of the flowers excellent. Many of the classes contained quite a surprising number of collections,

and there were sufficient to occupy the space that had been provided.

It was remarked by those responsible for the show, as by others, that an improved effect might be obtained on a future occasion by disposing of a few Palms or other fine foliage plants along the centre of the tables. From the same point of view we would recommend that the vases in the back rows be raised a little, in order that they may be seen to better advantage. An increased height of three quarters of a foot even would effect this.

There were many new varieties shown for Certificate, and several of these are certainly desirable acquisitions. Mr. Horace J. Wright, the hon. sec., had charge of the arrangements; and although these were somewhat unusual, as the place was a new one, there was excellent order, and general satisfaction.

OPEN CLASSES.

Special Classification Class.—The Classification Committee recognises nineteen variations in colour in Sweet Peas, and this class was intended to bring together the best variety of each type. The exhibits consisted of nineteen bunches of flowers, one bunch only of each recognised colour.

The 1st prize collection was from Mr. C. W. BREADMORE, 120, High Street, Winchester, and his selection of varieties was as follows:—Lady Grisel Hamilton, Duke of Westminster, Salopian, Jeannie Gordon, Duchess of Sutherland, Princess of Wales, Lord Rosebery, Dorothy Tennant, Prima Donna, America, Miss Willmott, George Gordon, Lottie Eckford, Dorothy Eckford, Gracie Greenwood, Navy Blue, Coccinea, Hon. Mrs. Kenyon, and Black Knight. 2nd, Mr. MARK FIRTH, Wistow Hall, Leicester (gr., Mr. F. J. Clark), who was very close; 3rd, Mr. A. G. HAYMAN, Hapswood House, Frome (gr., Mr. Ackland).

Thirty-six bunches, distinct.—The 1st prize in this class was won by Mr. MARK FIRTH, Wistow, Leicester (gr. Mr. Clark), and as a representation of a good collection of 36 varieties an enumeration of them may have interest, especially as the exhibit contained the choice new ones, as King Edward VII., &c. They were Lord Rosebery, Agnes Johnson, America, Blanche Burpee, Emily Eckford, Lady Mary Currie, Navy Blue, Glorious, Countess of Radnor, Mrs. Eckford, Lottie Hutchins, Her Majesty, Jeannie Gordon, Shazada, Gracie Greenwood, Monarchy, Prince Edward of York, Salopian, Captain of the Blues, Hon. Mrs. Kenyon, Lottie Eckford, Colonel, Triumph, Lady Grisel Hamilton-Duchess of Sutherland, Miss Willmott, Prince of Wales, Black Knight, Duke of Westminster, Coccinea, Dorothy Eckford, Prince of Wales, Countess of Lathom, Countess Cadogan, and Lovely. 2nd, Mr. LEONARD BROWN; and 3rd, Mr. C. W. BREADMORE. The competition was very close.

Twenty-four bunches, distinct.—There were four exhibits in this class, and Messrs. JONES & SON, Shrewsbury, won 1st prize. Their varieties were Dorothy Eckford, Pink Friar, George Gordon, Salopian, Captain of the Blues, Apple Blossom, Coccinea, Lady Mary Currie, Queen Victoria, Countess of Lathom, Navy Blue, Lord Kenyon, Duchess of Westminster, Lovely, Jeannie Gordon, Countess of Powis, Triumph, Duke of Westminster, King Edward VII., Mrs. Eckford, Maid of Honour, Prince of Wales, Othello, and Prince Edward of York. Mr. C. W. BREADMORE, 120, High Street, Winchester, was 2nd; and Mr. LEONARD BROWN, Daffodil Nursery, Brentwood, 3rd.

Twelve bunches, distinct.—There were four collections in this class, and the exhibits gaining 1st and 2nd prizes were pretty nearly equal in quality. The dozen bunches of flowers from Mr. C. W. BREADMORE were composed of large, strongly-grown flowers, well set up, and relieved with foliage, that showed how vigorous were the plants that afforded the blooms. Another collection, from Messrs. JONES & SON, Shrewsbury, was composed of very fine flowers, of which the size and colour were splendid, and they were fresher than in the group already alluded to. Messrs. JONES & SON were awarded 1st prize. Their varieties were Triumph, Maid of Honour, Lovely, Hon. Mrs. Kenyon, Othello, Lady Grisel Hamilton, Miss Willmott, Dorothy Eckford, Salopian, Jeannie Gordon, Prince of Wales, and Captain of the Blues; Mr. C. W. BREADMORE, was 2nd; and Messrs. E. W. KING & Co., Coggeshall, 3rd.

AMATEURS' CLASSES.

Thirty-six bunches.—This very large class in the Amateur section was won by Mr. A. G. HAYMAN, who showed a very commendable collection; he was followed by L. H. BAXTER, Esq., Brentwood (gr., Mr. H. Holloway); 3rd, Mr. H. J. MICHELS, Kingston.

Twenty-four bunches, distinct.—Mr. A. F. WOOTEN, College Road, Epsom, won the 1st prize from four other competitors in this class. He staged the following varieties, Miss Willmott, Emily Eckford, Mrs. J. Chamberlain, Jeannie Gordon, Dainty, Lady Grisel Hamilton, Navy Blue, Lord Rosebery, Hon. Mrs. Kenyon, Triumph, Lovely, Dorothy Tennant, Dorothy Eckford, Gaiety, Salopian, Prince of Wales, Black Knight, and Eliza Eckford; 2nd, Mr. H. MICHELS, Farleigh House, Kingston (gr., Mr. Hughes); 3rd, Mr. R. BATHURST, Dean Lodge, Iron Acton, Glos.

Twelve bunches, distinct.—The competition in this class was very remarkable, there being fifteen or sixteen collections. After considerable difficulty in determining the points, the 1st prize was awarded to Mr. HUGH ALDERSEY, Aldersey Hall, Chester, who showed the varieties following: Royal Rose, Dainty, Duke of Westminster, Agnes Johnson, Triumph, Dorothy Eckford, Miss Willmott, Mrs. Walter Wright, King Edward VII. (new), Lady Grisel Hamilton, Lady M. Ormesby-Gore, and Jeannie Gordon; 2nd, Mr. T. LOYD DAVIES, Park House, Addlestone (gr., Mr. Geo. Crabbe); 3rd, Mr. H. J. MEYER, The Grange, Harlow; and 4th, Mr. MARK FIRTH, Wistow Hall, Leicester (gr., Mr. F. J. Clark). All the flowers in this class were very meritorious.

Nine bunches, distinct.—Seven exhibitors had collections of nine bunches, and Mr. HUGH ALDERSEY, Aldersey Hall, Chester, won the 1st prize with excellent flowers in size and colour. His varieties were Lady Mary Currie, Countess of Radnor, George Gordon, Lovely, Hon. Mrs. Kenyon, Lady Grisel Hamilton, Othello, Mrs. FitzGerald, and Agnes Johnson; 2nd, Mr. A. STEER, Royston Park, Pinner; and 3rd, Miss BECKFORD, Oxford House, Ham Common.

Six bunches.—Mrs. F. BREWER, Suffield House, Richmond, had six very pretty bunches, showing the varieties Admiration, Gorgeous (fine colour), Black Knight, Lord Rosebery, Lottie Hutchins, and Hon. F. Bouverie; 2nd, Mr. S. J. JACKSON, Danehurst, Epsom (gr., Mr. G. Boyd); and 3rd, Miss BECKFORD, Oxford House, Ham Common. There were eight exhibits.

BUNCHES OF SWEET PEAS TO COLOUR (OPEN).

The following classes were intended to illustrate the best varieties in the nineteen colour sections recognised by the Classification Committee. The best in any colour could be thus easily determined, and it was noticeable that generally there was greater agreement amongst cultivators than might have been expected.

Two Bunches of White.—In the three exhibits out of seven that gained prizes in this class the varieties shown were Sadie Burpee and the new Dorothy Eckford, the latter generally having the better appearance.

Crimson.—Again all the three prize-winners were unanimous in selecting the same varieties for exhibition, these were Salopian and Mars, and of the two the former showed to the better advantage.

Yellow and Buff shades.—The 1st and 2nd prize-winners chose the varieties Hon. Mrs. E. Kenyon and Lady M. Ormesby-Gore, varieties very similar to each other. In the 3rd prize exhibit, Mrs. Eckford and Queen Victoria were shown. There were four exhibits.

Pink.—The varieties shown in this colour included Lovely, Prima Donna, Countess of Lathom, and Hon. F. Bouverie. In the exhibit awarded 1st prize Lovely and Prima Donna were shown. In the 2nd prize exhibit they were Countess of Lathom and Lovely; and in the 3rd prize Prima Donna and Lovely. There were seven exhibits.

Rose and Carmine.—The varieties known as Lord Rosebery and Prince of Wales won honours in this class. The flowers of each are very fine, but there is a difference in the shade of colour, Lord Rosebery being the brighter, and freer from purple tint. In the 2nd prize exhibit the varieties were Prince of Wales and Her Majesty; and for 3rd, Royal Rose and Lord Rosebery.

Mauve.—The 1st prize varieties were Admiration and Dorothy Tennant, whilst Fascination and Dorothy Tennant were shown in the only exhibit remaining.

Blue.—The two best Blues were Countess Cadogan and Navy Blue, the former being of the lighter-coloured section, and the latter very deep. In the 2nd prize lot Navy Blue was accompanied by Emily Eckford, which, as shown, is somewhat variable, certain flowers showing greater degrees of reddish tint. These varieties were repeated in the 3rd prize exhibit.

Orange.—There is not much difference between the varieties Miss Willmott and Lady Mary Currie, but the latter had four flowers upon a stem more frequently than the other. These varieties were shown in the 1st and 2nd prize collections, and of the two Miss Willmott was the more attractive. In the 3rd prize exhibit, the varieties were Miss Willmott and Gorgeous. There were six exhibits.

Blush.—Duchess of Sutherland and Modesty were shown by the winner of the 1st prize, and Duchess of Sutherland and Countess of Aberdeen by the winner of the 2nd prize.

Picotee edged.—The winner of the 1st prize showed Maid of Honour, one of the most characteristic of this type, and Golden Gate. In the 2nd prize, the exhibits were Lottie Eckford and Golden Gate.

Striped and flaked, red and rose.—There were four varieties shown of this type, and the winner of the 1st prize had Gaiety, white marked with purple, and America, white marked with deep red. In the 2nd prize exhibit, there were Aurora and Mrs. Joseph Chamberlain, whilst America, and Pink Friar, won 3rd prize.

Striped and Flaked Purple and Blue.—There were only two exhibits in this class. The varieties winning 1st prize were Grey Friar and Prince of Wales, and 2nd prize, Senator and Prince of Wales.

Bi-coloured.—The best varieties in the class for flowers exhibiting two colours and two only were Triumph and Prince Edward of York, and both were shown well. In the 2nd prize lot were Jeannie Gordon and Prince Edward of York.

Violet and Purple.—Duke of Westminster and Duke of Clarence were shown by the winner of the 1st prize, and in the 2nd prize lot Duke of Sutherland displaced Duke of Clarence. Judging from the flowers staged the two sorts in the 1st prize lot are the best in the section.

Maroon and Bronze, distinct.—There were six exhibitors in this class, and the varieties Black Knight and Boreatton were the best varieties shown. Othello and Stanley were the only other sorts exhibited.

Lavender.—The only varieties shown in this section, which includes some of the most delicately coloured of Sweet Peas, were Lady Grisel Hamilton, Lady Nina Balfour, and Countess of Radnor or New Countess, which are regarded as synonymous. The winner of the 1st prize had Lady Grisel Hamilton and Lady Nina Balfour.

Fancies.—In this group are included any varieties that are considered to possess more than two colours. The winner of the 1st prize showed Lottie Hutchins and Gracie Greenwood. In the 2nd prize lot, Gracie Greenwood gave place to Dolly Varden. There were four exhibitors.

Magenta.—Only one exhibitor put in an appearance here, and he showed Captivation and George Gordon.

Cerise.—The two bunches might be similar in this class, consequently every exhibitor had Coccinea in duplicate, showing that the variety has no rival.

The principal prizewinners in these classes were Mr. C. W. Breadmore, Mr. Hugh Aldersey, Aldersey Hall, Chester; Mr. R. Bathurst, Dean Lodge, Iron Acton;

Miss Beckford, Oxford House, Ham Common; Mrs. F. Brewer, Suffield House, Richmond; Mr. M. Y. Green, The Lodge, Eynsford; Mrs. A. Tigsell, Harrow View, Southall; T. Lloyd Davies, Park House, Addlestone; and Mr. H. J. Michels.

DECORATIVE CLASSES.

There were several classes for flowers arranged for decoration. In the principal class for a decoration for the dinner-table, Miss C. J. COLE, The Vineyard, Feltham, was 1st, and Messrs. JONES & SON, Shoplatch, Shrewsbury, 2nd. There were six exhibits in a similar class confined to amateurs. Mrs. RAPLEY, St. John's, Withdean, near Brighton, was 1st, and The Rt. Hon. Earl SPENCER, K.G., Althorp Park, Northampton (gr., Mr. Silas Cole), was 2nd.

The nicest épergne of Sweet Peas was arranged by Miss C. J. COLE, The Vineyard, Feltham; Miss DOROTHY M. OLIVER, 97, Tollington Park, N., was 2nd.

Messrs. JONES & SON had the best bouquet of flowers, and Miss C. J. COLE the best basket.

NEW VARIETIES.

Awards were made to the following varieties:—

Scarlet Gem, exhibited by Mr. H. ECKFORD, Wem, Salop, of very bright red colour, may be described as "Sweet Pea scarlet"; excellent size and form. Awarded a First-class Certificate and also a Silver Medal offered for the best novelty of the year.

King Edward VII., of deeper red colour than the foregoing variety; very fine, of large size, and excellent standard. Shown by Mr. ECKFORD (First-class Certificate).

Bolton's Pink.—A very rich, pink-coloured variety, of good size, shown by Mr. ROBT. BOLTON, Carnforth (Highly Commended).

Florence Molyneux.—A very charming striped variety, shown by Mr. ED. MOLYNEUX and Messrs. DOBBIE & CO. (First-class Certificate).

Cupids.—The following varieties of the dwarf Cupid were shown: Royalty, rosy-pink (Highly Commended); Her Majesty, of very deep rose colour (First-class Certificate); Lottie Eckford, mauve colour (First-class Certificate); Mrs. J. Chamberlain, striped rose and white (Highly Commended); and Captain of the Blues (Highly Commended). These were shown by Messrs. H. CANNELL & SONS, Swanley.

Lathyrus latifolius albus grandiflorus.—This extraordinary white variety of the perennial Pea has been described many times in these pages. Shown by HOBBIES, LTD. (First-class Certificate).

NON-COMPETITIVE EXHIBITS.

Messrs. HOBBIES, LTD., Dereham, Norfolk, exhibited Rosas, Carnations, and Sweet Peas (Gold Medal); Messrs. DOBBIE & CO., Sweet Peas (Silver-gilt Medal); Mr. C. W. BREADMORE, Sweet Peas (Gold Medal); Mr. ECKFORD, Sweet Peas (Silver-gilt Medal); Messrs. H. CANNELL & SONS, Sweet Peas, including an excellent lot of Cupids in variety in pots (Gold Medal); Messrs. JONES & SON, Shrewsbury, Sweet Peas (Large Silver Medal); and Messrs. E. W. KING & CO., Coggleshall, Sweet Peas (Silver Medal).

ROYAL HORTICULTURAL Scientific Committee.

JULY 7.—Present: Dr. M. C. Cooke, V.M.H. (in the chair); Messrs. Holmes, Gordon, Maasee, and Saunders, Prof Boulger, Revs. W. Wilks and G. Henslow (hon. sec.).

Apple trees and Insects.—Mr. SAUNDERS reports as follows upon specimens received from Mr. Campbell, of Ardross, Leeds:—"The Apple-trees are attacked by the caterpillars of two different moths, but the habits of both kinds are very similar. The green caterpillars are those of the winter moth (*Cheimatobia brumata*), the brown and yellow ones of the great winter moth (*Hybernia defoliaria*); both belong to the family Geometridae, and are two of the most destructive pests to Apple-trees. The females of both kinds are either wingless or have only the rudiments of wings, so that they are incapable of flight. The chrysalides are formed in the ground, so that when the moths emerge, it is evident that they must climb up the trees if they wish to lay their eggs, as is their custom, near the buds. To prevent this ascent is one of the most important things to be done, if it is desired to protect the trees from attacks by the caterpillars. The simplest way of effecting this is to fasten grease bands round the stems, which the caterpillars are unable to cross. As this might injure the tree if the grease came in contact with it, a strip of grease-proof paper, 7 or 8 inches wide, and long enough to overlap an inch or more, should be tied round the trees, say 3 feet from the ground, and fastened top and bottom with best matting or soft string that will not cut the paper. Over this should be tied a strip of calico about the same width, also tied top and bottom; this must be well smeared with cart-grease, soft-soap,

and train-oil mixed, so that a soft, sticky compound is formed in which the moths will be caught. These bands should be put into position as early as the middle of October, and kept in working order until well after Christmas. To do this the bands should be re-greased every now and then, or whenever it is found that the grease is losing its stickiness, or, as is sometimes the case, that it is clogged up with the number of moths caught in it. Notwithstanding these precautions, some of the females may find their way into the young shoots. Some are no doubt carried by the males (who fly well) when coupled, so that it is useful, when it can be carried out, to spray the trees before the buds show any signs of opening with a caustic alkali wash, made by dissolving 1 lb. of caustic soda in half a bucket of water, add $\frac{1}{2}$ lb. of pearlash, and stir until all is dissolved, then add enough soft water to make 10 gallons, and finally stir in 10 oz. of soft soap which has been melted in a little hot water. This mixture is very caustic, and must not be allowed to touch the skin or clothes, or if it does it should be wiped off as soon as possible. A still day should be chosen, so that the wind will not blow it on to the operators; this spraying should kill the eggs if any are laid on the tree. To destroy the caterpillars the trees should be sprayed as soon as the fruit has set with paraffin emulsion, or $\frac{1}{2}$ lb. of Paris-green and $\frac{1}{2}$ lb. of lime mixed in 50 gallons of water. This mixture must be kept well stirred, as the Paris-green is very heavy and soon sinks to the bottom, and in this case some of the mixture will be too weak to kill the caterpillars, and the rest so strong that the foliage will be injured."

Lilac shoots and Frost.—Mr. MASSEE showed a curious and important effect of frost on the leaves of the Lilac. The apex was frost bitten, then, after a thaw, the leaf became attacked by Botrytis cinerea, which travelled down the region of the midrib and petiole, till it attacked the terminal bud between the leaves. As thousands of flower buds were thus destroyed in consequence of the late frost, great pecuniary loss accrued to the growers for the flower markets.

FLORAL COMMITTEE AT CHISWICK.

JULY 15.—Present: H. B. May, Esq. (in the chair); and Messrs. W. J. James, A. Perry, C. Jeffries, R. Dean, W. Cuthbertson, W. P. Thomson, H. J. Jones, J. W. Barr, C. R. Fielder, J. F. McLeod, and C. Dixon.

AWARDS OF MERIT.

Poppy Mephisto.—Plant of upright, vigorous habit, and very free-flowering. Flowers single, 4 or 5 inches across, with deeply-cut petals; colour crimson, heavily blotched with black. From Messrs. BARR & SONS, 12, King Street, Covent Garden.

Poppy Cardinal, white.—A sturdy-growing variety, 18 inches or so high, with lovely Hollyhock-shaped, snow-white flowers $\frac{3}{4}$ inches across. From Messrs. DOBBIE & CO., Rothesay.

Poppy "glaucum."—The Tulip-Poppy is well adapted for edgings, as it is neat in growth, rarely exceeding 15 inches in height. It is of branching habit, and displays beautifully-shaped crimson flowers, blotched with black at the base of each petal. From Messrs. DOBBIE & CO., Messrs. BARR & SONS, and Messrs. JAS. VEITCH & SONS, King's Road, Chelsea.

HIGHLY COMMENDED.

Poppy White Colossal.—Height, 2 feet 6 inches; upright habit. Flowers double, 5 inches across, white, like a narrow petalled Begonia. From Messrs. BARR & SONS.

Poppy Murselli fl.-pl., American Flag.—A strong-growing variety, about 2 feet high, with double Carnation-like flowers, white ground streaked and edged with purple. From Messrs. DOBBIE & CO.

Poppy Blush Cardinal Victoria (syn. New Double Victoria).—Height 18 inches. Plant of upright, sturdy habit; flowers double, pale pink. From Messrs. DOBBIE & CO.

Poppy "arcuarium."—Height 15 inches. Plant of slender habit, with scarlet flowers blotched with black at the base of each petal. A continuous bloomer. From Messrs. DOBBIE & CO.

MEETING OF THE CHAMBRE SYNDICALE AT GHENT.

JULY 6.—At the meeting on the foregoing date of the Chambre Syndicale des Horticulteurs Belges, the following awards were made:—Certificates of Merit for Cattleya Goossensiana var. magnifica (par acclamation), C. Mossii alba var. superbissima (par acclamation), and for C. Parthenia var. nobilissima (C. fimbriata x C.

Mossie, all from M. A. PEETERS, of Brussels; for C. Mossie, from Mme. L. DE HEMPINNE; C. Mossie Reueckiana, from the Marquis DE WAVRIN (*par acclamation*); and for C. Mossie Wagneri citrina (*à l'unanimité*), and for C. Mendeli delicata—these two plants also from the Marquis DE WAVRIN. Certificates were also allotted for Laelio-Catleya (C. gigas × L. elegans Turneri), from M. T. DE BIEVRE, head gardener at Laeken (*à l'unanimité*); for a group of C. Mendeli, from M. M. VERDONCLE (*par acclamation et avec félicitations du Jury*); and for C. Mendeli, from the same exhibitor.

Floral Certificates were won by Oncidium pulvinatum, from Mme. L. DE HEMPINNE; and for Odontoglossum Schlieperlanum, from MM. J. VANDEPUTTE ET CIE.

Honourable Mention was awarded for Trichopilia coccinea, from MM. POURBAIX FRÈRES, of Mons; and for Acriides Wagneri, from the Marquis DE WAVRIN.

Certificates of Merit were awarded to Anthurium Pourbaixi, from MM. POURBAIX FRÈRES; double Begonia Souvenir de Louis de Smet, from M. P. PARRÉ; for cut flowers of Dianthus barbatus, sent by M. F. VAN DRIESSCHE (*à l'unanimité*); and a similar award (*par acclamation*) was awarded for cut flowers of Dianthus barbatus, with double flowers, sent by the same exhibitor.

EALING HORTICULTURAL.

JULY 8.—The thirty-ninth exhibition was held in the Walpole Park on the above date, and, for the district, there was a good display of plants, flowers, and fruits. The weather was fine, in marked contrast to that of last year, when the show was held at Gunnersbury Park amid drenching rain.

Prizes open to all comers were for Roses only, and two trade competitors entered in both classes. Messrs. G. & W. BURCH, nurserymen, Peterborough, came South with some very fine blooms indeed, and took the 1st prizes both for forty-eight and twenty-four blooms; Mr. C. TURNER, Royal Nursery, Slough, coming 2nd in both classes. Such varieties as Her Majesty, Souvenir de Président Carnot, Ulster, Antoine Rivoire, Marchioness of Londonderry, Gladys Harkness, Bessie Brown, Frau Karl Druschki, Mildred Grant, Muriel Grahame, White Lady, Medea, Madame J. Ramey, and White Maman Cochet, were in fine character, and greatly pleased the local rosarians. Roses shown by local growers were very good for the season. The Society's Silver Cup for twenty-four blooms was won by Mr. W. OWEN (gr. Mr. R. Green).

Specimen plants were fair. Some good Fuchsias were staged, both as bushes and standards. The best specimen flowering plant was a fine Begonia corallina, and the best foliage plant a good bush of Asparagus plumosus. There were also some excellent table plants from Mr. F. G. GLEDSTANE'S, Old Manor House, Gunnersbury (Mr. F. Milson, gr.), among them Leea amabilis, a charming table plant, the leaves veined with silver on a dark olive-green ground—a plant that appears to be only imperfectly known; it is a stove subject.

Some good black and white Grapes were shown by Mr. MILSON, otherwise the Fruit classes were weak; while the vegetables grown by gardeners were distanced in quality by those produced by working-men on the allotment gardens.

Mr. J. HUDSON, gr., Gunnersbury House, sent blooms of Nymphaea stellata, also a deeper coloured Berlin variety named W. Stone, and a large seedling from N. gigantea, with a number of very fine blooms of the hardy varieties. Mr. GEO. REYNOLDS sent from Gunnersbury Park a fine group of flowering plants, in which Carnations and the blue-flowered Exacum macranthum were delightful features.

Messrs. FROMOW & SONS, nurserymen, Turnham Green, had a large group of Japanese Acers, mingled with white Lilies; and Mrs. H. B. SMITH, Court florist, Ealing, had a collection of most delightful designs in flowers, which formed excellent object-lessons to the ladies who exhibited in the foregoing classes.

DEVON & EXETER GARDENERS'.

JULY 8.—The annual summer outing of the Association took place on the above date, about ninety members, honorary members, and friends joining in a journey to Watermouth Castle, the seat of Mr. C. H. Basset, formerly M.P. for Barnstaple, and Master of the Devon and Somerset staghounds.

The castle, situated about five miles from Ilfracombe, stands on an eminence overlooking the Bristol Channel, with the Welsh coast and Lundy Island in the distance. Mrs. Basset and her daughter (Mrs. Curzon) welcomed the party, and the latter, with Mr. James Turner, the head gardener, accompanied the visitors on their walk through the gardens and grounds. Growing against a wall, in the open, a Citrus was noted, with many large ripe fruits on it. Hard by were two grand specimens of Acer polymorphum atro-purpureum, with Bambusa nobilis 20 ft. high near to them. Good examples of Chamærops excelsa were noticed, and of Halesia tetraptera. Bananas are well grown in the houses; and in a pool were noted some good

Nymphaeas—Laydekeri, rosea, L. lilacea, L. purata. Marilacea carnea, M. chromatella, Robinsoniana, aurora, Andreana, &c. These are growing at the foot of what is being converted into a wild or alpine garden. The mansion contains many art treasures and trophies of the chase. Under the quadrangle in front are many tunnelled subways formerly used by smugglers, and communicating with a series of caves adjoining, which were explored by the party.

Combe Martin, an ancient market town, once the headquarters of the local silver-mines, and now a straggling fishing village, consisting of a single street about two miles in length, was visited.

CROYDON HORTICULTURAL.

JULY 8.—Held on the above date in the grounds of Addiscombe Court, the residence of the Mayor. Undoubtedly the great feature of the show was the Roses, as these nearly filled a big tent, and were in unusual force.

The most interesting competition was in the Amateur class, for the new Challenge Vase, thirty six flowers being staged. This was won by A. TATE, Esq., Downside, Leatherhead (gr., W. Mease), with really very fine blooms, one of which, Mrs. J. Laing, was awarded a Silver Medal, as being the best in the exhibition. A few other fine flowers were François Michelin, La France, Her Majesty, Mildred Grant, Marie Baumann, White Maman Cochet, and Dr. Andry. Mrs. T. B. HAYWOOD, Woodhatch, Reigate, was a good 2nd, her gardener, Mr. C. J. Salter, having taken the Cup wholly last year. But this lady had good 1sts in the classes for twenty-four Roses, fifteen Teas, six trebles, and twelve of one variety, beautiful blooms of Mrs. J. Laing. Mr. E. MAWLEY, of the National Rose Society, was awarded a 1st in one class. Local amateurs exhibited very largely. The trade figured strongly also; Messrs. B. CANT & SONS, Colchester, coming 1st with forty-eight singles, having with others Marie Verdier, Ulrich Brunner, Dupuy Jamain, Mrs. J. Laing, La Havre, and Karl Druschki; Messrs. D. PRIOR & SONS, Colchester, were 2nd; Messrs. F. CANT, Colchester, 3rd. Messrs. B. CANT & Co. were again 1st with twenty-four blooms.

Messrs. D. PRIOR & SONS were 1st with twelve of one variety in fine blooms of Bessie Brown; Messrs. F. CANT & Co. coming 2nd with very fine flowers of Karl Druschki. In another class Messrs. F. CANT & Co. were 1st with beautiful flowers of Mrs. E. Mawley. Mr. SALTER had the only lot of twenty-four bunches of stove and greenhouse flowers; a fine collection of Orchids, Allamandas, Gloxinias, Pelargoniums, Cannas, &c.

Sweet Peas were shown in remarkable abundance, as also were hardy flowers in the numerous competitive classes; indeed, cut flowers were in unusual force.

MISCELLANEOUS.

The horticultural trade, as is usual at shows, figured largely, doing so very much to make another huge tent most attractive. Messrs. J. LAING & SONS, Forest Hill, had a fine group of Palms and other foliage plants, set on a base of brilliant Begonias; and against a background of hardy cut flowers. Mr. T. BUTCHER, Croydon, had a somewhat similar plant group, which included many fine Kalosantes, Hydrangeas, Pelargoniums, &c., and also a table of floral decorative material. Mr. J. B. BOX, Croydon, put up a very effective bit of rockwork and a superb lot of Beronias. Messrs. J. JACKMAN & SONS, Woking, and Messrs. PAUL & SONS, Cheshunt, had fine banks of cut Roses.

Messrs. T. WARE & SONS, Feltham, had quite a big collection of hardy cut flowers. Mr. AMOS PERRY, Winchmore Hill, also had these, also a fine collection of Nymphaeas in water; and Messrs. H. CANNELL & SONS, Swanley, put up one of their unrivalled collections of Cannas, in a group and in small pots—all held to be so easy to grow, yet singularly enough no one attempts to rival this firm in producing them.

FRUIT

was moderately shown, the only collection of six dishes coming from Col. INGLIS, Reigate (gr., Mr. Phillips), which comprised Black Grapes, Melons, Pineapples, Nectarines, Figs, Pears, and Royal Sovereign Strawberries.

The best White Grapes, very fine berried Buckland Sweetwater, came from H. PARTRIDGE, Esq., Casile Hill, Bletchingley (gr., Mr. Barber); Foster's Seedling coming 2nd and 3rd.

With Black, Mr. LINTOTT, gr., Marden Park, was 1st with well-finished Hamburgh; Mr. BLURTON, gr., Kingswood Warren, Banstead, was 2nd.

Mr. LINTOTT had a fine dish of Royal Sovereign Strawberries; Mr. BARBER coming 2nd with the same variety.

Mr. PHILLIPS had the finest dish of Tomatos, and Mr. BARBER, was 2nd.

Visitors crowded the tents and grounds during the afternoon and evening.

Mr. ROFFEY continues to be the affable and courteous secretary.

ULVERSTON.

JULY 10.—A good show of Roses and the best of music are attractions which have made this celebrated Northern show a success every year. Throughout the day the trains brought in crowds of visitors, and again the "gate" was early assured. The exhibition was held in Todbusk Park, the marquee erected covering a space of 210 feet by 30 feet. Had the weather proved propitious on the previous week, the entries would have exceeded those of any previous show at Ulverston, but the gale was of so furious a kind as to render many rosarians unable to compete.

In the Nurserymen's section, a very fine exhibit came from Messrs. ALEX. DICKSON & SONS, Newtownards, co. Down, who had truly marvellous blooms in the class for seventy-two distinct varieties. The best blooms were those of Bessie Brown, Alice Lindsell, Dr. Andry, Ulster, Frau Karl Druschki, Mrs. Conway Jones (a fine novelty), Mildred Grant, Robert Scott (extra fine), Mrs. D. McKee (a new yellow H.-T.), and A. K. Williams.

For sixteen trebles and for thirty-six distinct varieties they led the way with superb flowers of Lady Ashdown (new), Gladys Harkness, Mildred Grant, Alice Grahame, Alice Lindsell, Louis Van Houtte, Duchess of Westminster, Horace Vernet, Gustave Piganneau, Marchioness of Dufferin, and Bessie Brown. In the latter class, Mr. H. V. MACHIN, Worksoy, was 2nd with flowers of much smaller size.

In the class for eighteen distinct varieties, six dark, six light, and six Teas, Messrs. DICKSON were 1st, staging Lady Derby (new), Frau Karl Druschki, Bessie Brown, Luciole, and Gladys Harkness; Mr. H. V. MACHIN was 2nd. Messrs. DICKSON'S Teas were handsome. They had also the best twelve dark-coloured Roses in Tom Wood, and the twelve light in Mildred Grant, the best seedling in Lady Ashdown, a beautiful variety.

The same firm of nurserymen won the Bronze Medal for the best Rose in the show with Mildred Grant; Mrs. E. Mawley was their best Tea.

NEW ROSES.

The New Rose class consisted of Alice Grahame, Gladys Harkness, Duchess of Westminster, Lady Derby, Robert Scott, Countess of Annesley, Mildred Grant, Frau Karl Druschki, Duchess of Portland, and a seedling. The Gold Medal was awarded them for points. In almost every class Mr. MACHIN was very creditably represented.

Amateurs made an imposing addition, the Gold Challenge Cup and National Rose Society's Medal going for the second year in succession to F. W. TATTERSALL, Morecambe, with blooms of fine quality, and in variety similar to those previously mentioned. The Rev. R. T. LANGTREE had an unusually even lot of eighteen distinct varieties; and with Mr. MIDLEY and Mr. MACHIN honours were very evenly divided in the smaller classes. Mr. MACHIN scored with six trusses of Gustave Piganneau, the same variety winning for him the Bronze Medal. Mrs. W. J. Grant was the best H. T., shown by Mr. GARNETT.

The Ulverston District Challenge Cup was taken by Mr. T. J. HARRISON, Ulverston, and the Myles Woodburne Challenge Trophy by Mr. H. E. JOHNSON, for Innocente Pirola.

MISCELLANEOUS.

The J. Towers Challenge Trophy, value 20s., for Sweet Peas, brought out a splendid array, and Mr. MARK FIRTH, Leicester, won; as he also did for twelve bunches.

For one of ten guineas Dr. JACKSON proved victorious. Hardy cut flowers from Messrs. A. DICKSON & SONS were excellent, as were the Sweet Peas from Messrs. BOLTON & SONS; and a group of Souvenir de la Malmaison Carnations from Mr. Feuner, gr. to VICTOR C. W. CAVENDISH, Esq., M.P., formed a striking exhibit.

The onerous duties of arranging the show were ably carried out by the joint honorary secretaries, Messrs. Mackereth and W. Poole. *Orchid.*

MANCHESTER HORTICULTURAL.

JULY 11.—Manchester is a noted horticultural centre, holding some seven shows annually, and on the 11th inst. a very fine exhibition took place in the Royal Botanic Gardens in that city. The creepers on the roof of the spacious annexe scarcely afforded the amount of shade required, and long stretches of tiffany were put up, and as the day was somewhat overcast visitors were enabled to inspect the exhibits in comfort.

Before proceeding to mention the exhibits, there is an interesting fact to be recorded as to the future of the Manchester Botanic Gardens, and one that should gladden the hearts of all who know the good work that has been carried on in them, and who have of late years seen their future hanging in the balance. The Stretford Council, in whose district they are situated have been for some time in negotiation with the Botanical Council, and at the luncheon over which Mr. Alderman Gibson presided, Mr. F. Robinson, Chairman of the District Council, said that there were two things

on which both parties were agreed, viz., that since 1829 the Society had done a grand work in forwarding the study and spread of horticulture, and must continue to do so, and also that the gardens must remain for ever for the public benefit; and on these grounds the Stretford Council were unanimous in promoting both these ends.

Of the exhibition itself, we are able to speak in the highest terms. The Roses this year have suffered in Lancashire more from the weather than perhaps any other outdoor flowers, and great was the surprise afforded by the exhibits from Essex, Gloucestershire, Herefordshire, Worcester, Berks, and the North of Ireland, which entered the competition. Nor were the Lancashire Roses greatly below the usual standard of excellence, except that in several stands the blooms were deficient in size and not of good form. In every class competition was keen.

The class of sixty distinct varieties brought six competitors, and the highest award fell to Messrs. HARKNESS & Co., Hitchin, with a bright, varied stand of bold blooms, the following being among the more prominent varieties:—White Maman Cochet, Ulster, Mildred Grant, Mme. Hoste, La France de '89, Mrs. E. Mawley, Papa Lambert, Gustave Piganneau, Mrs. W. J. Grant, Her Majesty, Medea, Marchioness of Londonderry, Mrs. J. Laing, Duchess of Portland, and Frau Karl Druschki. Messrs. ALEX. DICKSON & SONS, Newtownards, co. Down, and Ledbury, were 2nd. Perhaps the flowers from the Irish firm were not so heavy as those from other sources; the collection was notable for containing the splendid new Rose Dean Hole, a flower of a deep flesh-colour; Dr. Davison, dazzling scarlet, shaded intense violet-crimson, and a great acquisition; and Mrs. D. McKee, a rich yellow H.T. The blooms of Mildred Grant, Louis Van Houtte, Lady Mary Fitzwilliam, and Alphonse Souper were distinctly good. Messrs. F. CANT & Co., Colchester, were 3rd.

Eight competitors showed in the class for thirty-six, distinct; and here again Messrs. HARKNESS led with very superior flowers, those of Bessie Brown, Killarney, Ulster, Ulrich Brunner, Gladys Harkness, Papa Lambert, Gustave Piganneau, Her Majesty, and Frau Karl Druschki being very conspicuous. Messrs. D. PHOIR & SONS, Colchester, were 2nd, showing capitally.

The most brilliant class in the show was that for twenty-four Teas or Noisettes, in which Messrs. F. CANT & Co. were placed 1st by very few points. Exquisite were the blooms of Etoile de Lyon, Francisca Krüger, Madame Hoste, Jean Ducher, White Maman Cochet, Mrs. E. Mawley, Cleopatra, Comtesse de Nadailac, and Emilie Gonin. Mr. G. PRINCE, Farringdon, was 2nd.

There were nine competitors in the class for twelve varieties of Tea Roses, the contest being this time in favour of Mr. G. PRINCE for a very beautiful lot of blooms.

There was in the classes for twelve single trusses the same keen competition, and the quality, substance, and colour of the blooms caused much admiration, the award for twelve of any white or yellow falling to Messrs. R. HARKNESS & Co., with White Maman Cochet; for twelve crimson variety, to the KING'S ACRE NURSERY Co., for A. K. Williams; and twelve any light coloured to Messrs. ALEX. DICKSON & SONS, with superb Mildred Grant. In this section Messrs. ALEX. DICKSON & SONS had the best H.P. or H.T. in Mildred Grant; and Mr. GEORGE PRINCE had the best Tea in white Maman Cochet.

AMATEURS.

Not less exciting was the contest waged in these classes, the six boxes of twenty-four distinct varieties being the equals of any in the exhibition. Mr. E. B. LINDSELL, Brearton, Hitchin, was 1st with blooms which could scarcely be surpassed, and we especially name Frau Karl Druschki, Horace Vernet, Dr. Andry, Alice Lindsell, Gustave Piganneau, Muriel Grahame, and Marchioness of Londonderry; Rev. J. H. PEMBERTON, 2nd, had smaller high-coloured blooms.

Mr. LINDSELL's flowers were of great merit in his 1st prize stand of twelve blooms distinct; Mr. R. FOLEY HOBBS being 2nd.

For the best eighteen Teas or Noisettes Mr. CONWAY JONES, Gloucester, carried off the honours in fine style with scarcely a faulty bloom, Comtesse de Nadailac, Medea, Innocente Piroia, Elise Fugier, and souvenir de S. A. Prince, being his finest; Mr. R. FOLEY HOBBS was 2nd.

Mr. R. PARK, Bedale, had a capital dozen of Teas or Noisettes; and for twelve blooms of any light-coloured Rose Mr. R. PARK was 1st with Bessie Brown; Rev. J. H. PEMBERTON, for twelve white or yellow, was 1st with Bessie Brown; and twelve any crimson he was 1st with Gustave Piganneau.

The display of garden Roses was not so good as usual, and the 1st prize went to Mr. JNO. MATTOCK, Oxford. Messrs. J. TOWNSEND & SONS had a canopy of well-flowered Crimson Rambler and other interesting varieties. By far the best lot of flowers were shown by Mr. PRINCE, who was 3rd.

Mr. MATTOCK had the best twelve bunches of button-hole Roses.

—Messrs. PERKINS, of Coventry, were 1st for three bouquets with Niphotos, Sunrise, and Catherine Mer-

met. The basket from the same exhibitors was light and graceful to a degree, the flowers and foliage of Sunrise harmonising perfectly.

SWEET PEAS.

Manchester has long been in the front in Sweet Pea culture, and improvements in the flower were noted in all directions, Mr. J. DERBYSHIRE, of Hale, gaining the Silver Medal for the best collection of these flowers; and Dorothy Eckford, Hon. Mrs. Kenyon, Lord Rosebery, Coccinea, Gracie Greenwood, and several new seedlings of great merit were observed. He was also 1st for twelve distinct varieties; whilst for twenty-five varieties Mr. F. SMITH staged many admirable vases.

A grand feature of the show was 100 vases of Sweet Peas from Messrs. JONES & SONS, Shrewsbury, the Silver-gilt Medal being a somewhat inadequate reward. Messrs. CALDWELL & SONS, Knutsford, had a charming collection of hardy herbaceous perennials, alpine, and bulbous plants; and Messrs. PILLING, of Hyde, and PATTON, of Shrewsbury, a large display of Violas.

There was also a magnificent *Lilium auratum* from Mr. J. W. WILLIAMSON, of Stretford, a model of good cultivation.

There was a fashionable attendance throughout the day, and an admirable military band provided the outdoor attraction. *Orchid*.

SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.

JULY 11.—On Saturday afternoon last the members of this Society richly enjoyed a visit to the famous vineries of Mr. Peter Kay, of Finchley. Led by their President and founder, Mr. George Schneider, and Mr. W. O. Hiehle, they journeyed from Broad Street to Church End Railway Station, where they were met by Mr. Thos. Bevan, and piloted to and through the vineries.

Many of our readers know something of the Grapes grown at Finchley, but it is interesting to record the fact that Mr. Kay has more than 20 acres of glass, and nearly all of this is devoted to the culture of the Vine. The only other crops are Tomatos and Cucumbers, and these in comparison with the Grapes are small. Not only are Grapes the principal crop in this great area of glass, but even of Grapes, only three varieties are cultivated. These are Canon Hall Muscat (a Grape that is never seen better than at Finchley), Black Alicante, and Gros Colmar. The young Frenchmen, also others of several nationalities (including a son of the head gardener of the King of Italy), and a few English friends, inspected most of the houses, and noted the excellent appearance of the Vines, from the Muscats already ripe to the latest batch of Gros Colmar for sale next winter.

Another very interesting feature at Finchley is the system adopted for preserving the water supply. Some years ago, Mr. Kay informed the party, the water question was a very serious one. He found that it was necessary to pay the water companies from £700 to £800 a year, albeit there was an average rainfall of 24 inches. He set to work and dug out a pit, puddled the bottom of it, and converted it into a lake to contain the water which fell upon the 20 acres of glass. From the lake a supply is allowed to run into a smaller reservoir, and it is then pumped up into a water-tower, from which it has a fall over the entire nursery, there being an excellent supply in every house, and pipes and hose wherewith to apply it. The water thus saved has proved sufficient for the needs of the place, and there is the additional advantage to that of economy, in that the plants are afforded nothing but rain-water.

After attention had been given to these and other object-lessons, Mr. and Mrs. KAY entertained the company of about fifty persons upon the lawn adjoining the residence, and a very pleasant time indeed was spent. President Loubet's visit to London having just terminated, this cordial hospitality to a Society of Frenchmen in London seemed doubly appropriate. Mrs. Kay, in French, proposed the health of the President; and Mr. Schneider, in English, that of the King; then were sung the National Anthems of both countries. Mr. Kay toasted the Society, and Mr. Schneider gave some particulars of the useful work the Society is doing in bringing together in social intercourse young Frenchmen who come to this country and remain for a year, or perhaps two years. There were many other speeches made, including one of much interest by Mr. HUNT, formerly Secretary of the Wellington Horticultural Society in New Zealand, who described the conditions under which land may be obtained in that colony.

It may be hoped that other proprietors of such establishments may invite the Society to spend a Saturday afternoon with them; the privilege will be greatly appreciated. The company dispersed with feelings of gratitude to Mr. Kay for his kindness, and many will remember for some time to come the home-made Grape-wine he offered them. English Grape-wine evidently is made at Finchley as well as at Cardiff, but in the former case the Grapes used are produced in glasshouses, whilst those at Cardiff are from out-of-door vineyards.

THE REVIVAL OF THE CO-OPERATIVE FLOWER SHOW.

It will be in the remembrance of many that a series of extensive flower shows was organised and carried out for a number of years at the Crystal Palace by the Agricultural and Horticultural Association. The series came to an end in 1901, owing to the discontinuance by the railway companies of the cheap travelling facilities offered to those attending the Festival, which also operated materially to diminish the number of entries from members of provincial co-operative societies. Probably there were very few exhibitions held about the country on which so much human interest centred as in the case of this particular one. Last year the Executive of the Festival organised a small flower-show; this year operations in this direction were considerably extended, with the result that a schedule of prizes of some eighty-two classes was issued, and they were divided into three sections of about an equal number of classes.

The classes were, on the whole, easy, and of plants, zonal Pelargoniums, Ferns, Coleus, Fuchsias, and Petunias some very fine specimens were staged, Musks, Harrison's in particular, being finely developed. Of annuals in pots, the most effective were Lavateras, Convolvulus minor, Schizanthus, Mignonette, Calliopsis coronata, and Phlox Drummondii. Cut flowers were represented by some of the best things in bloom in the open ground just now; there were very good Sweet Peas, and, considering the season, very good Roses in a few cases, the common fault evidently being to cut them too old. Fruit was fairly well shown, and there were some very good vegetables; but in every section the average was satisfactory.

A large collection of cut flowers in great variety was sent as a miscellaneous exhibit by Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, to which a Certificate of Merit was awarded; and the same award fell to SMITH'S Nursery, Crown Hill, Upper Norwood, who had a similar exhibition; and also to a collection of interesting Cacti, from some person whose name did not transpire.

A few Sweet Pea, of pale flesh-colour, bearing four flowers on a stem in seventy-five cases out of a hundred, and named Gladys Unwin, was shown by Mr. J. UNWIN, Histon, Cambridgeshire.

It is intended to materially increase the schedule of prizes for next year.

ANGER TO ANIMALS FROM POISONOUS SPRAYS.

—In the *Pharmaceutical Journal* for April 11 last, Mr. HENRY JOHNSON directed attention to the danger to animal life arising from the use of arsenical weed-killers and similar preparations. Subsequently the *Morning Post* expressed the hope that the question might soon be definitely settled whether wild animals would eat foliage after it had been sprayed with poisons, and whether the fact of their doing so would be injurious. In an editorial note which appeared in the *Journal* for April 25, at p. 600, it was stated that the answer was self-evident, but it was suggested that chemists and druggists residing in the country should collect evidence in support of the contention that the use of poisonous sprays does constitute a danger to animal life. So far, the chemists and druggists of the country have not forwarded any information to "headquarters" on the point, but conclusive evidence has been supplied by Vice-Consul A. W. W. WOODHOUSE (Nicolaieff), who, in a report dealing chiefly with agriculture in South Russia, writes as follows:—"Locusts are again appearing in large numbers. Successful attempts were made by an entomologist last June to poison some fields by sprinkling them with a solution of 1 lb. of Paris-green to 15 gallons of water. The larvæ, which were in the second and third stages at the time, were nearly all found dead by the evening of the third day. Care must be taken to keep sheep and cattle from such poisoned fields, as on the occasion in question some stray animals were poisoned a week after the experiment. . . . The Siberian marmot still requires attention, as although its numbers have been sensibly reduced by poisons and traps, it continues to occupy a prominent position among the farmers' enemies. The poison used is arsenic, with which grain is treated and dropped into the marmot holes. The trapping process is the better one, as useful birds are not endangered thereby; it is enforced by the rural administration." *The Pharmaceutical Journal*, July 11, 1903.

ANSWERS TO CORRESPONDENTS.

- ACER VARIEGATED:** *W. L.* There are two reasons for the production of green leaves—1, the green leaves may come from the stock on which the variegated form has been budded; 2, the variegated leaves frequently revert to the normal green condition.
- APPLE:** *Mr. Henderson.* The variety is Sturmer Pippin, well grown and finished, which in a great measure accounts for the good condition in which it has kept till this date. It would be interesting to know the conditions under which the fruit has been kept. We cannot say much for the flavour. If there were no good foreign Apples in the market perhaps these would be acceptable. The fruit sent might do for culinary purposes.
- ARBRE D'AMOUR:** What tree is meant by this name? *C.* [The Judas tree, *Cercis siliquastrum*, is sometimes called the "Love Tree" in England. *Ed.*]
- A WEEDY LAWN:** *F. B. D. G.*—Not much may be done at this season, but you might spud out, that is, lift with a clawed spud all the Thistles, Ranunculus (Buttercups), Dandelions, Plantains, and deep-rooted plants generally, filling in the holes left by the withdrawals with heavy loam, putting a pinch of grass seed of good quality on each, and beating it into the surface with the back of a spade. If there are many Daisies, these ought to be drawn out where most numerous sprinkling loam over the patches. Encourage the growth of the grasses by occasionally applying "Watson's Lawn Sand." If there is not much improvement noticed by the autumn, it will be advisable to manure and dig the soil one spit deep, and sow the best lawn grasses then or in early spring.
- BAMBOOS, BEST TIME FOR SHIFTING:** *M.* We have found early May the best time to shift Bamboos (Metaké included). The point is to do it just when there are indications of new growth, not before. They very often shrivel and look badly afterwards, especially if a dry spell sets in; but we have never found that the underground part of the plant suffers, and towards the end of the summer the upper part gets furnished. If you take off side-pieces with very little root the business is more risky, and in that case it is best to pot up the rhizomes and establish in heat. After transplanting they should be kept watered, and if possible syringed in dry weather. *W. J. B.*
- CAMPANULATE FOXGLOVES:** *P. J. R.* A very frequent occurrence, and referred to in this column as recently as last week.
- CERRIES DROPPING:** *X. Y. Z.* The flowers were not properly set owing to cold and ungenial weather—only too common this year. It is not a disease.
- CHRYSANTHEMUM LEAVES:** *P. J. P.* The caterpillars had escaped; syringe the plants with Quassia-water.
- CUCUMBER GOING OFF:** *Pasque.* Material sent quite insufficient.
- CUCUMBER PLANTS GOING OFF:** *C. J. D.* The material sent is insufficient, and you should send large pieces of the bine, full-grown leaves, and a few main roots, and sample of the soil the plants are growing in.
- CYPHOMANDRA BETACEA:** *Damian & Co.*—A bunch of the fruits was figured in the *Gardeners' Chronicle* for March 19, 1887, p. 383, and a tree growing in the Temperate house, Royal Gardens, Kew, in the issue for Feb. 18, 1899, p. 105.
- GLOXINIA:** *J. W. F.* The variety of which you send a specimen was formerly common. It is due to an outgrowth from the normal corolla.
- GRAPES:** *Lady E.* The spot disease all too common. It is due to a fungus called *Glaosporium*. Burn all the affected berries so far as possible. Try spraying with a 10 to 15 per cent. solution of sulphate of iron in the winter, before the leaves expand. Bordeaux Mixture might be used as a preventative in the same way. Take care not to use it when the leaves begin to expand, unless very weak.
- LATIN MOTTO:** *W. H. A.* The words *Prosunt gentibus artes* may be translated "The arts are beneficial to the nations."
- MELON:** *P. B.* You have not read your *Gardeners' Chronicle* attentively, or you would know how terribly prevalent this disease is. You can do nothing in the way of cure now, but you may prevent it by turning out the soil and burning the diseased plants. Do not plant again in the same pit. The Grapes have probably split from excess of water and lack of ventilation, perhaps from the excessive rainfall lately.
- MICE AND VOLES:** *J. W. K.* Do not use poison against the creatures, or dogs, cats, poultry, pheasants, &c., may be killed by it; but keep a cat or two, and make use of traps constantly. If you are living in the country do not kill owls, hawks, and carrion crows, and only destroy stoats and weasels if you keep fowls.
- NAMES OF PLANTS:** *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*H. J. Tuppen.* *Eucalyptus globulus.*—*F. W.* We cannot name varieties of Roses; your specimen had fallen to pieces.—*A. B. R.* 1, *Thalictrum minus*; 2, *Calycanthus occidentalis*; 3, *Saponaria vaccaria*; 4, *Sedum Ewersii*; 5, *S. spurium*; 6, *Lamium purpureum*; 7, *Lychnis* sps.—*A. W.* 1, *Erigeron philadelphicus*; 2, *Hieracium aurantiacum*; 3, *Chenopodium bonus Henricus*. The Currants and Cherry specimens shall be examined.—*R. M.* The Begonia leaves are disfigured by mites (*Tarsonymus*); dip them into tobacco-water.—*Correspondent (red card-board box without name).* *Bignonia speciosa* and seed-vessel; *Habenaria bifolia*; *Pernettya mucronata.*—*W. S.* 1, *Ginkgo biloba* (Maidenhair tree); 2, *Fraxinus excelsior*, golden-leaved variety; 3, *Hieracium aurantiacum*; 4, *Stenactis speciosa*; 5, *Pyrethrum parthenium*, double white; 6, *Tradescantia virginica.*—*C. P.* *Polygonum convolvulus*, a troublesome weed.—*E. M. B.* 1, *Phoenix dactylifera*; 2, *Adiantum cuneatum*; 3, *Adiantum hispidulum*; 4, *Gymnogramma ochracea*; 5, *Pteris tremula*; 6, *Dracæna intermedia.*—*F. H.* 1, *Rosa Blairii*, n. 2; 2, *Cupressus funebris* in juvenile stage; 3, *Trachelium cœruleum*; 4, *Statice Armeria*; 5, *Anthericum lineare variegatum*; 6, The yellow flower, *Celsia critica.*—*No name.* *Stanhopea Devonensis*; two garden varieties of *Begonia sub-peltata*; *Saxifraga umbrosa serratifolia*, and *Lilium Thunbergianum elegans.* Why not number the specimens?—*H. S.* Yes, your *Clerodendron* has a fungus on it. You must please remember that it is no part of our duty to name plants for you, though we are desirous to oblige so far as we can consistently with our proper work. Considering that you send no fewer than eighteen specimens, instead of six only, we think you should send us a small contribution for the *Gardeners' Orphan Fund*. 1, *Centaurea montana*; 2, *Alstroemeria aurea*; 3, *Deutzia crenata*, double; 4, *Pseudotsuga Douglasi*, the Douglas Fir; 5, *Hedera Rœgneriana*; 6, *Hedera helix digitata*; 7, *Colutea arborescens*; 8, *Spiræa Douglasi*; 9, not recognised; 10, *Lychnis chalconica*, double flowers; 11, *Aubretia deltoidea*; 12, *Phlox frondosa*; 13, *Phlox divaricata*; 14, *Linaria reticulata*; 15, *Thalictrum flavum*; 16, *Stenactis speciosa*; 17, *Helenium autumnale*; 18, *Rudbeckia* sp.—*Oliver.* *Buddleia variabilis*; *Veronica Traversii.*—*N. F. P.* *Spiræa trilobata*; *Saxifraga gem.* so far as we can tell without flowers.—*G. H. S.* 1, *Sonchus* sp. probably—no flower left; 2, *Senecio Hodgsoni*; 3, *Galega orientalis*; 4, *Lathyrus sylvestris*; 5, *Senecio sibirica*; 6, *Centaurea macrocephala*; 7, *Stachys (Betonica) grandiflora*; 8, *Silene Armeria*; 9, *Sanguisorba* sp.—*R. S. Q.* 1, *Genista alata*; 2, *Acæna novæ zelandiæ*; 3, *Viola cornuta*; 4, *Silene*, withered; 5, *Dianthus cæsius*; 6, *Sanguisorba*; 7, *Acæna*; 8, *Arabis lucida variegata.*—*A. F.* *Pyrethrum parthenium*, double-flowered variety.—*J. M.* *Trachelium cœruleum.*—*Miss C.* *Allium moly.*—*W. B.* sends 3s. for *Gardeners' Orphan Fund*, which we acknowledge with thanks. 1, *Anacyclus radiatus*; 2, *Pelargonium quercifolium*; 3, a *Linaria*; 4, *Leptospermum lævigatum*; 5, *Erigeron philadelphicus*; 6, *Aster alpinus*, white
- variety. The specimens were much withered when received. If you will send better specimens, we will try to make better guesses.—*C. G.* *Gladiolus communis.*—*R. B. G.* *Lathyrus magellanicus.*
- NURSERYMEN AT CAPE TOWN:** *Constant Reader.* Chas. Ayres, R. Johnson, Rondebosch, and R. Templeman.
- ONIONS DISEASED:** *Anxious, Boston.* Onion mildew. Destroy all affected plants, and do not sow on land once affected.
- PEACHES DROPPING:** *A. C. D.* The fruits sent for inspection have the stone split, allowing moisture to enter and set up decay in the kernel. This splitting may have been caused by some check, such as abundance of water afforded the border after a long period of drought will cause. It often happens that the gardener allows the soil to get unduly dry during the winter and early spring, and then affords a deluge. The soil should be kept moderately moist at those seasons.
- PLANTS OF PTERIS, CALANTHE, CATTLEYA ASPARAGUS, DOING BADLY:** *E. P. C., Chester.* The various plants are suffering from being grown under unsuitable conditions. The Orchid pseudo-bulb and leaf is *Maxillaria rufescens.*
- PORTABLE CENTRAL STAGING FOR A GLASSHOUSE:** *Reader.* The sort of staging most convenient for removal should be made in sections 10 feet long and 3 feet broad, and as supports to have trestles made with four legs each, and of the required height. The sections of the staging may readily be kept in position by having cross-pieces 2 inches deep nailed on to them about 2 inches from the ends, and the top of each trestle made 4 inches in width to serve as bearings. Dowls may be let into the latter, and holes to correspond cut out with the centre-bit on the under side of the staging. Let the staging be made of red deal, primed with red-lead paint, and painted twice with white lead. The trestles may be made of the same kind of wood, or any hard wood, and should be painted of some neutral tint, so as to be as little conspicuous as possible. Any country carpenter would furnish an estimate.
- POTATO:** *Ed. W.* We are unable to name the tuber.
- POTATOS:** *J. T. S.* We can see nothing to account for the buds remaining dormant. It is due to some "idiosyncrasy" in the particular tuber which we cannot account for.
- RED CURRANT LEAVES AND MORELLO CHERRIES FALLING:** *A. W.* *Septoria ribis* is injuring the Red Currant-leaves, and *Gnomonia erythrostoma* has killed the Cherry-leaves. The surest remedy is to remove all dead and injured leaves in both cases, and burn them. Thoroughly drench the trees during the early spring, before the buds begin to swell, with a solution containing 1 lb. of sulphate of iron in 5 gallons of water. *G. M.*
- REFRIGERATING ESTABLISHMENT:** *M. F.* We suppose you refer to a description of the cold room at Messrs. Thomas Rochford & Sons' nurseries, which was published in the *Gardeners' Chronicle* for Nov. 3, 1900.
- SUPPOSED MEALY-BUG ON IVY:** *F. W. Church.* The insect is *Lichtensia viburni*, a species of *Coccid* allied to the brown scales of the genus *Lecanium*. It is an extremely local insect in this country, feeding exclusively on Ivy and Laurustinus, but it does not cause any appreciable harm to its food-plants. The female is naked up to the time of egg-laying, when she covers her body with a thick sac of white wax, in which she lays her eggs, and dies.
- COMMUNICATIONS RECEIVED.**—*J. D. C.*—*H. Böhler*—*W. H.*—*F. W. B.*—*W. E. G.*—*W. W.*—*J. R. J.*—*Royal Gardens, Kew.*—*J. K.*—*A. J. Cook.*—*J. Snell.*—*J. T. S.*—*A. B.*—*S. C.*—*R. J. L.*—*W. E. M.*—*E. C. Lloyd.*—*J. B.*—*C. Jones.*—*L. W. C.*—*London County Council.*—*A. D.*—*E. K.*—*H. H. D'Ombrain.*—*G. O.*—*E. J.*—*Ed. M.*—*W. A. C.*—*Maurice & Co.*—*S. D. & Co.*—*Dicksons.*—*M. Kremer.*

ROSES AT THE ANTIPODES.

IT has been sometimes said as a matter of reproach that we are very insular, and carry our customs and ideas and habits of thought with us wherever we go; but the world is much smaller than it used to be, and sons and daughters of the Old Country are now to be found in large numbers in Australia and New Zealand, and it is no uncommon thing to hear of them taking a trip home without much thought of its difficulties and dangers, where formerly it was a question of a six months' voyage, which was never contemplated without a shudder. Amongst those things which we have carried with us to the Colonies has been our love of flowers—a love which has greatly increased within the last few decades; and surely it is a very happy thing that we can point to this as a very strong proof of the unity of the Empire! I myself have many relations in the Antipodes—my only surviving brother lives in Australia. He is a devoted student of Nature, and in his home at Melbourne he has a small zoological garden; and some of his children have in them that love of flowers which has been so great a pleasure and comfort to those of their relations who have stayed in the Old

Country. One of my nieces from time to time sends me a paper showing what they are doing with regard to the culture of the Rose, and has lately forwarded me one containing an account of a plebiscite which has been held at Melbourne, in which it has endeavoured to inform lovers of the Rose in the colony, and who have been engaged in its culture, what they consider the best Roses to grow; and it is interesting to notice the agreements and disagreements between such a list and that which the National Rose Society has given as the best Roses to grow in our own country.

Climate has, of course, a great deal to do with this, and we see some Roses assuming a topmost rank which we should not assign to them here at home; not that we differ from them as to the value of the Roses, but simply because in our climate we cannot manage them. Take one notable example. In their selection of the best twelve, Cloth of Gold takes its place. Now I suppose that there is not a grower in this country who would not like to include this in his list, but that he knows that his doing so would be but a fraud on his fellow-rosarians. There are only a few places where it can be grown successfully; but in the bright climate of Australia, where it has not to encounter such enemies as frost and snow, I can well understand that this, the finest of all yellow Roses, occupies a prominent place. Yet perhaps there are some places where it might be tried even here, only that people are afraid of its uncertainty.

The National Rose Society has been the means of forging a link between the Mother Country and her daughters. Affiliated societies have been formed both in Australia and New Zealand, and both the Gold and Silver Medals have been competed for and awarded in those colonies.

In dealing with the list furnished by the Melbourne Society it is well to bear in mind that it does not confine itself to exhibition flowers. We are told that the correspondents were asked to consider the Roses asked for as those which could be recommended for their all-round gardening qualities of hardiness, freedom of blooming, variety of shape and colour, and habit of growth, and hence the list which has been selected by the very numerous growers must not be taken up as a guide to us here at home, and which will be seen at once when I give the names of those selected. Besides Cloth of Gold already mentioned, there are La France, Maman Cochet, White Maman Cochet, Maréchal Niel, Devoniensis, Bouton d'Or, William Allen Richardson, Reine Marie Henriette, Prince Camille de Rohan, Safrano, and Bridesmaid. Bouton d'Or, a Rose of which we know little in this country, seems to find favour there; with us it is too full, although in the hotter climate of Lyons, where it was raised by J. B. Guillot in 1867, it is a very charming Rose; and so in the warmer climate of Australia it is no wonder it is found as a favourite. Again, that grand Rose, Maréchal Niel, is hardly suitable for out-of-door cultivation at home, except in the warmer parts of our isle, and therefore we do not wonder at the high place it takes among Australian cultivators; again, it is interesting to find that some of our best exhibition Roses are contained in the list of twelve furnished by the Society

of Melbourne, where we find Mrs. John Laing, Maman Cochet, White Maman Cochet, Prince Camille de Rohan, and Bridesmaid, one of the numerous sports from Catherine Mermet. Again, William Allen Richardson, that universal favourite, is put down among the twelve best Roses, not, be it remembered, as exhibition, but as best all-round Roses. I should almost expect to find Crimson Rambler contained in the list, but it is not included.

Accompanying this list there are some very sound and practical observations on culture, and it is evident that the multiplication of Roses by cuttings, which has never taken a very deep hold of our home Rose growers, is followed in Australia with a good deal of keenness; and of course the climate, without the rigours of our winters, is favourable for this method of culture. And I think we may bid all our fellow-rosarians in Australia to go on earnestly in the culture of our favourite, and hope that they may furnish us from time to time with some account of their progress.

Wild Rose.

NEW OR NOTEWORTHY PLANTS.

CRINUM LUGARDÆ, N. E. BROWN (n. sp.).

THIS new Crinum is a very distinct one, characterised by its comparatively small bulb and long, narrow, deeply channelled green (not glaucous) leaves, rough along the margins. It was discovered on the Kwebe Hills, near Lake Ngami, in the dry interior of Southern Africa, by Mrs. E. J. Lugard, who presented a bulb to the Royal Gardens, Kew, where it has recently flowered. A coloured drawing of it, however, has long been in the Kew collection, made by Mr. T. Baines at Koobies (Kobis), which is also in the region of Lake Ngami. Its nearest ally appears to be *C. Rautenianum*, Schinz, but it differs in having smaller flowers and a smaller bulb, which latter, according to a note on Mrs. Lugard's label accompanying a dried specimen, only attains to about "6 inches in circumference."

The following are its specific characteristics:—Bulb small, 1½ to 2 inches in diameter, ovoid, with a neck 2 to 3 inches long. Leaves 1½ to 2½ feet long, ¼ to ¾ inch broad, linear, acute, deeply concave, channelled down the face, minutely scabrous along the margins, otherwise glabrous, deep green, not at all glaucous. Scape 4 to 12 inches long, erect, slightly compressed, two to six-flowered. Bracts 1½ to 3 inches long, the outer ½ to ¾ inch broad, oblong-lanceolate, acute, with inrolled margins, the inner linear or linear-filiform. Pedicels almost none or up to ½ inch long. Ovary ellipsoid, ¼ to ½ inch long. Perianth-tube 3½ to 4 inches long, slender, cylindrical, curved, gradually (or according to a drawing, abruptly) passing into the funnel-shaped limb, green; segments 3 to 3½ inches long, 6 to 10 lines broad, lanceolate, revolute at the tips, white, with a rather light pink median stripe, and a thickened green apical point. N. E. Brown.

CHINA.

THE rich collection of specimens acquired in China by Mr. E. H. Wilson, on behalf of Messrs. James Veitch & Son, will be remembered with great interest by all those who had the opportunity of seeing them in the spring of the present year at the Royal Horticultural Society. The publication of new species in the *Botanical Magazine* and in our own columns will have also attracted the attention of plant-lovers. So successful was Mr. Wilson in his collection and transmission of valuable and interesting plants

that he was again despatched to Central China and it is confidently to be expected that the diligence and skill of the collector, no less than the intelligence and enterprise of his employers, will be rewarded by the introduction of yet more wonders and novelties. What collectors have to go through may be illustrated by the following extract from a letter of Mr. E. H. Wilson just received, for which we are indebted to the courtesy of Messrs. Veitch.

"Chungking.

"I have much pleasure in reporting my safe arrival at the above city. I left Ichang on the evening of April 24, and arrived here on the afternoon of the 21st inst. The voyage, though long and tedious, was free from any serious accident to ourselves or boat. We had one man drowned and several injured from falls, but this is only the usual thing. No part of the river above Ichang is free from danger, and some of the rapids are frightful. My boat's crew consisted of twenty-four men—seven on the boat, and seventeen ashore to pull her along. At all the rapids extra men are engaged; at the worst rapid, the Yeh Tan, it took nearly a hundred men to haul my boat over (large cargo boats employ 200 and upwards). At this rapid, where we lay for the best part of a day, I watched ten boats hauled over; of these ten, three were wrecked. The first was a total wreck, and sank almost immediately; I could not see how many men went down in her. The second had a hole knocked in her bottom, and was with difficulty beached. The third lost her rudder. We had eleventh turn, and got over safely.

"Immediately we were over, a small boat with five men in attempted to cross, capsized, and two of the five were drowned. Boats are wrecked and life lost every day at this river, and the people maintain a calm indifference. Life is cheap in this part of the world! Small red boats are stationed at the foot of all the bad rapids. The duty of these boats is to save all life they can, pick up all bodies, enclose and bury them. It is a splendid service—the best philanthropic institution I know of in China. I botanised whenever I could get ashore *en route*, but saw nothing fresh of horticultural value, and very little new to me botanically."

BULB GARDEN.

LILIES.

MR. WILLIAMSON, on p. 14 of the *Gardeners' Chronicle* for July 11, speaks of a finely-developed *Lilium auratum* that is giving three stems and a large array of buds. Your correspondent obviously would prefer a smaller number possessed of normal quality, as the hint of a reduced number distinctly implies. Indeed, these fasciated forms are not usually beautiful, rather do they but minimise the greater beauty of that grand hill Lily of Japan to which Mr. Williamson refers. Writing of this species in particular, one's thoughts revert to the superb central group of *Lilium auratum platyphyllum* (Shirley variety) included in the Messrs. Wallace's hardy plant group at the recent Holland House Show. Passing notice was made of this finely-developed form in the report of the meeting in question (see *Gardeners' Chronicle*, June 27, p. 421). In all its forms *L. a. platyphyllum* is really a superb Lily, and the one in question a veritable prince even among them. To give a better general idea of the plant in question, we may say the flower is virtually that of *L. a. virginale*, though more widely spread perhaps, and more massive and imposing generally. If we touch on the stature of the variety, we have none save the variety *platyphyllum* with which to compare it, and indeed it is just a fine form of this with a flower of great purity. Happily in the *platyphyllums*,

as a rule, we have vigour greatly superior to the typical *auratum*s, and markedly so when we come to compare the permanent characteristics of the two. And it is just this desirable point that distinguishes the Shirley variety. Not only was there exhibited a plant 6 feet or more in height, but there was good leafage nearly to the rim of the pot. Good roots at the base of the stem account for the extra vigour of these plants, and that is the key to the whole matter. Perhaps the most important information imparted at Holland House Show was that the entire stock of bulbs have been raised from a single bulb purchased a dozen years ago.

Speaking of Lilies in general, it is worthy of mention that many fine groups may now be seen at Kew in the border, sandwiched between the rock garden and the herb ground. Indeed one or two species, *L. candidum* and *L. testaceum*, are very good. Of each many groups may be found in the border, and in one or two of *L. testaceum* I counted the other day from a dozen to fifteen stems of about 6 feet in height, and bearing eight or nine flowers each. *L. candidum*, too, was very fine.

L. testaceum is extremely strong and vigorous, the rather dark-coloured stems well furnished with foliage, and the plants comparatively free from disease. The plant will usually succeed in rather heavy loam, and this, if of good quality, is preferable to soils that require constant additions of manure. *E. H. Jenkins.*

CONTINUOUS CROPPING OF LAND WITH ONE KIND OF PLANT.

I WAS asked the other day if it was credible that Strawberries could be cultivated continuously with the same plants on the same ground during a period of sixty years and still yield profitable crops. I have no doubt it is credible, though the oldest quarters of Strawberries I have known extended not greatly beyond forty years, one instance being in a market and another in a private garden.

The above question suggested if it is in every case wise to act too indiscriminately on the modern principle of changing crops from one part of the garden to another at intervals of short duration. Much must, of course, depend on the nature of the soil. In the instances just referred to, the soil in both cases was a strong loam; and though the practice of digging between rows of Strawberries has been repeatedly condemned as barbarous and ineffective, it did not prove so in these cases. On the contrary, I have no doubt it was distinctly beneficial, the process of digging being equivalent to a rough-and-ready annual pruning of the roots, and also acting on the soil mechanically and perhaps manurally.

Another curious instance of successful one-vegetable cropping within my own knowledge was the annual production of prize Onions on the same plot of ground.

Less striking is another case of which I am cognisant, in which Celery has occupied the same ground, the same trenches indeed, for the last thirty years, but extending beyond that time perhaps indefinitely. Celery-trenches are so heavy that the conditions are more favourable than in the case of either the Onion or the Strawberry, but not so much so as to detract from its being somewhat remarkable.

In another garden I can trace back during quite forty years a custom of producing Sweet Peas annually on exactly the same lines or rows; how much longer than that time it would be hard to guess, but at least twenty years. In the same garden, early Peas were always grown on the same bit of border, and always successfully.

In my own experience, the most striking example of continuous cropping I am able to cite is

in connection with the Brussels Sprout. On the light, heavily-manured soil here, Sprouts always proved unsatisfactory, producing "bulbs" large enough to satisfy the most exacting lover of mere size, but, alas, so little compact that they were not appreciated in the dining-room. Finding that one particular spot yielded firmer and less bulky sprouts, the crop was grown annually there during a space of fifteen years, no change whatever being affected in the way of cultivation, the plants of one year being set in the furrows, made in earthing those of the year previous, not infrequently the aid of a crowbar being required to make holes for the roots, as has occurred the present season. Alterations necessitated the shifting of the crop about eight or nine years ago, since when it has been produced on another piece of ground under like conditions, the soil meanwhile having been undug and unmanured.

During many years Tomatos, too, have been cultivated successfully in the same material. Indubitably larger fruits would result if the old material were replaced by new; but as the fruit invariably comes the right size for use, exchange would, on the whole, be of little or no benefit.

In the case of flowers, it may be interesting to remark that Narcissus have been cultivated successfully on the same ground from ten to twenty years, a portion being lifted annually for forcing and for pot-culture, and at intervals the whole of the bulbs are lifted, sorted, and replanted, the only manure employed on these occasions when the ground is re-dug being an application of superphosphate of lime. It is only right to add, however, that annual surface-dressings are applied with no niggardly hand.

It would be rash to say that all or any of the instances mentioned could be successfully adopted in other gardens. For example, I cannot depend on Sweet Peas succeeding two years in succession on the same ground. It was very earnestly desired to have a long row annually of one particular variety of these in the flower-garden; the second year there was a very perceptible decline in vigour and quality; and in the third, notwithstanding some extra trouble as to removal of soil, they were so disappointing that it was necessary to remove them and replace them with other plants. Moreover, it is true that a garden can be managed with the expenditure of less labour, and in other respects more cheaply when rotation of crops is the general rule.

My old friend of the unchanging Onion-bed was forced to undertake annually a preparatory course requiring no slight amount of labour. Rotation thoughtfully pursued saves much of that. Following Celery, for example, the trenches being levelled as the crop is lifted, ground requires merely "pointing" to fit it for the reception of Onions. If extra-sized bulbs are desiderated, an addition of manure causes a little more labour. To follow the Onion crop, Cabbages succeed well if the ground is stirred in the lines to be occupied by these plants, thorough cultivation being needed thereafter.

In connection with these remarks, it may be noted that quantities of used soil, generally fertile loam or turf in which short-lived plants have been cultivated, is sometimes equal in value with fresh soil for other plants. Soil rendered quite fibrous by the roots of Tomatos or of Cucumbers has often been employed instead of new soil with perfectly good results. Again, if the balls of used-up Chrysanthemums or of Cinerarias, both soil-absorbing subjects, are laid up for several months, the material will be found of much utility for growing a variety of common plants. Where there is an unlimited supply of turf, it is, perhaps, unnecessary to be careful of that once used; but it is worth while knowing that such material is not without value. It, indeed, does not seem unreasonable to suppose

that the roots of other plants besides Grasses are capable of affording food to other plants; and under the conditions of supplying large quantities of artificial and other manures that exist at present, it is not wonderful that used soil is so fertile as undoubtedly it is. B.

CULTIVATION OF CARNATIONS IN THE UNITED STATES.

THE first operation in the cultivation of these plants is propagation. Healthy plants are selected for furnishing cuttings, which should not have been forced, undue warmth under glass tending to weaken the plants. The best cuttings are obtained from plants which have ceased to flower, and the most suitable season is from the beginning of November to April. Having been head propagator in a large nursery in New Jersey, I am competent to advise the following methods to be followed. Set aside a bench of about 4 feet in width, over which place bricks evenly over the crocks on the bench to prevent the soil washing out; then apply water copiously to the bricks, for if this be not done the bricks will absorb much moisture from the sand, and the cuttings will dry up. Over the bricks place a layer of clean, not very coarse sand, 3 to 3½ inches thick over the bricks, and make it level and smooth with a stick; again apply water in abundance, and beat the sand bed very hard. The bed is now ready for the cuttings, which should be of firm texture, not too large or fleshy, or too small and weak. The bench having a width of 4 feet, place thirty-five to forty cuttings in a row across it, and afford water carefully to each row. The air of the house should be kept moist at all times. I cannot give any rule for applying water, but I have kept a houseful of cuttings of late varieties for a week without water; its application is a matter of judgment.

The most suitable temperature for a cutting-house is from 50° to 60° Fahr., and if it should become warmer afford air, but not too much, for if the cold air comes in contact with the cuttings very much, they will get wilted. When the cuttings are callused, apply water copiously, affording no more till they are rooted. When rooted do not allow them to get too dry, or red spider will attack them. When well rooted, pot them up, affording shade till the roots have taken hold of the soil.

FIELD CULTURE OF CARNATIONS.

The Carnation is by no means a tender plant, and in our latitude we plant about the middle of May. When the plants are put out in the field, a small trench is made along the rows so as to take the water afforded the plants after planting.

The pinching of the leading shoots is one of the most important details in the culture of Carnations. When the plants show any long flowering shoots, they should be pinched off, but not too low down. In the first week of September, when the plants are ready to be planted in the house, they should not show a sign of a flower-bud. Before lifting the plants a good over-night watering is afforded them, and care is taken when digging them up to preserve the roots from injury, and to keep as much soil around them as possible. They are planted at distances of about 10 inches in the rows, and a space of 12 inches is left between. Care is taken to prevent planting them too deeply or stem rot may set in. The plants should be cleaned before planting, and for a time afterwards the atmosphere of the house is kept close until the roots become again active.

By taking a little clay and mixing it in water a solution is obtained to smear the glass, which helps to keep the house a little cooler than it would be otherwise. The plants are syringed occasionally, and when the roots begin to spread a little more air is afforded, which is afterwards

FIG. 19.—WAVERLEY OAKS.

increased. The soil should be renewed annually, and it should not be too rich, but it may contain about one-sixth part of good fresh cow-manure and a little bone meal.

The temperature of the Carnation-house should be 50° at night and 65° to 70° during the day. Disbudding is done about once a week, the object being to concentrate the strength of the plant into the main flower-bud. David A. Dean, Waverley, Mass., U.S.A.

WAVERLEY OAKS.

I ENCLOSE you herewith six photographs showing some of the White Oaks (*Quercus alba*), as they appear in the State reservation at Waverley (Belmont), Massachusetts. For the greater part of the following information regarding them, I am indebted to several persons who sent replies to my inquiries through the *Boston Transcript*.

Six or seven miles from Boston, in the town of Belmont, near the Waverley Station, is one of the

FIG. 20.—WAVERLEY OAKS.

Height 80 feet; circumference at 5 feet from the ground 25 feet; age 800 years.

most remarkable groups of White Oaks in New England, and perhaps in the United States. Some of the largest grow on gravel ridges, which Professor Agassiz reported as probably the terminal moraine of a local glacier. Their roots, however, feed from the rich alluvial deposits near the ridges, and some of them drink from the waters of the Beaver Brook near by.

Professor Agassiz was interested in these trees, and I am told that he estimated the age of the largest, then lying partly decayed upon the ground, to be about one thousand years. There are in all in the reservation twenty-six of these aged Oaks, the most notable, perhaps, being eight which grow along the Kame.

Figure No. 19 represents a tree which stands on the lower end of the "Kame," and which is thought to be from five to six hundred years old. Since the State has taken an interest in these trees they have all been subjected to careful and skilful treatment, with satisfactory results. The dead branches were cut off close to the trunks in such a way that the healing operation would go on with the least interruption; the wood thus exposed was covered with tar, as it also was elsewhere when not protected with healthy bark, and the cavities and cracks were all filled in with cement.

The figure marked No. 20 grows, with another, on the highest part of this ridge. The one in front is supposed to be the oldest tree remaining. It measures 25 feet in circumference at 5 feet from the ground, and 28 feet over the swell of the roots, and the height is 80 feet. The longest branch is about 70 feet long. Its estimated age is eight hundred years.

By the lowest reasonable estimate all the trees figured and those adjacent must have been growing when Columbus crossed the Atlantic, and quite well grown when the Pilgrims landed.

A gentleman now nearly eighty years old, who takes a special pride in these trees, and who was born and has lived in Belmont or its neighbourhood all his life, says that neither he nor his father, whose memory carries the record back over one hundred years, ever saw a seedling White Oak start growth in the reservation. *Archibald Smith, Boston, Mass., December 18, 1902.*

MARKET GARDENING.

SOUVENIR DE LA MALMAISON CARNATIONS.

RECENTLY I observed on Messrs. Hugh Low & Co.'s stand in the flower-market, Covent Garden, a batch of the variety Churchwarden selling at 2s. per dozen, the plants being now two years old. The plants, growing in 32's, possessed three to four blooms each, besides unopened buds.

It may be of interest to Mr. Briggs to know that I have watched very closely all that pertains to the cultivation of these plants as market subjects, and also the profit side of the matter, with advantage to myself. The number of those engaged in this branch is increasing. As cut blooms I saw them sold for as much as 12s. per dozen on July 13, and even admitting that 6s. is a fair price, it is profitable business. I believe that there is more profit obtained from the older plant than from the young, although the latter produce the bigger blooms. The Guernsey growers, who send a regular supply, have done very well, obtaining as much as 10s. per dozen blooms. It is a moot-question with the smaller grower how to grow these plants at a profit, which can only be done when a specialty is made of the plants, and glass-houses built specially for them. Then, given a suitable locality, with suitable soil and good cultivation, Malmaisons are a success.

DICTAMNUS FRAXINELLA ALBA.

This is an excellent wet-weather plant. The Ash-like foliage and the erect spike of white

blooms, which are strongly scented, make *Dictamnus Fraxinella* a striking plant. The rose-coloured variety is rather difficult to propagate, except from seed, and *D. F. alba* is readily increased by division. Wet weather has no injurious effects on these plants, and I have a spike of flowers before me as I write which was cut to-day (July 19) in a heavy shower at Messrs. Wm. Cutbush & Son's Nursery at Finchley.

CISTUS LADANIFERUS.

Long introduced into this country, and a most deserving plant for pot-culture or planting in a border! The individual blooms last for only one day in hot weather, but a profusion of flower-buds is always coming on. All the Rock-roses have each their individual beauty, and in the case of this one the flowers are white with spots inside at the base of the petals. This plant is successfully grown at the Finchley Nurseries of Messrs. B. S. Williams & Son. It may be interesting to those who like the *Cistus* to know that they may be raised from seeds sown in March or April. So-called hardy varieties (*Helianthemums*) do well in certain localities as rock plants, &c., and in sunny borders; *C. ladaniferus* is safe under glass.

CAMPANULA ISOPHYLLA AND C. I. ALBA.

The former are much less common in market establishments than *C. i. alba*. Some growers afford small doses of Clay's fertiliser and Davis' manure, and they turn each plant round every few days so as to make them shapely all round. *Stephen Castle.*

C A M B R I D G E.

THE BOTANIC GARDEN.—It is a great pleasure to visit a garden which affords evidence of vitality apart from mere routine; and it is highly satisfactory to be able to see that things are done with a purpose and not in a haphazard fashion. Such are the general impressions derived from a hasty visit to the Cambridge Botanic Garden in mid-July. The surface is flat, and the general arrangement not remarkable; but when one comes to look into details and to consider what are the objects of the garden and how those objects are carried out, one can but congratulate the University on the possession of such a garden, and on their good fortune in having the services of so efficient a curator as Mr. Lynch.

The garden has on various occasions been described in our columns (see *Gardeners' Chronicle*, May 27, 1899, p. 329), so that it is not necessary to describe the comparatively new range of houses that has been erected; nor can we on this occasion specify their contents, as the time at our disposal only sufficed to gain an idea of the outdoor arrangements. It is enough to say that the range consists of a long corridor, from which project at right angles various separate span-roofed houses (the central one the larger) devoted severally to Succulents, to Ferns, Orchids, and to other plants.

In front of one of these houses the eye is at once attracted by a group of hardy *Opuntias*, of which a mass of *O. glauca* is very striking, with its huge, flat, plate-like joints now in full growth, producing numerous yellow flowers and young shoots. *O. cantabrigiensis* is almost equally fine. Other species are *O. missouriensis* in bloom, *O. arborescens*, *O. monacantha*, *O. bicolor*, &c., intermixed with such plants as *Agave utahensis*, *Cotyledon Purpusii*, *Echinocereus phoeniceus*, in flower. These hardy "xerophytes" are evidently quite at home; the soil is dry and calcareous, the exposure sunny, and the warmth and shelter afforded by the adjacent building very much to their taste. The bays between the projecting glasshouses afford warmth and shelter to a host of interesting plants which do not do so well, if at all, in the open garden. *Echeveria glauca* lives here all the winter, so do *Calsalpinia japonica*,

Cestrum fasciculatum, *Dasyliirion Hookeri*, *Beschorneria yuccoides*, &c. *Kniphofias* like *caulescens* and *Northia*, the yellow-flowered *Eremurus Bungei* appreciate the protection, and *Hymenocallis Harrisiana* and *Ismene calanthina*, now in full bloom, could hardly do without it. *Crinum Powellii* and the white variety are in full bloom, and near them, affording a great contrast, the singular *Polygonum equisetifolium*, and the equally curious *Clematis aphylla*. *Sauromatum guttatum*, which one expects to see in a stove, is quite happy in the open air, and so is the *Puya*, a plant of which from the Scilly Isles attracted so much attention at the Temple Show. But as we have no desire to write a catalogue, we must cease to enumerate the treasures that are to be found in those sheltered bays.

Close by is the rockery, and the list of interesting plants observed on it occupies several pages of our note-book. But as it is impossible to go into detail, and a mere enumeration of names would be tiresome, we forbear to transcribe them. We must be equally reticent with the contents of the herbaceous borders. Passing along, we note beds devoted to the illustration of "xerophytes," "halophytes," "hydrophytes"—that is, of plants peculiar to or preferring to grow in dry, saline, or wet soil respectively, so that the student may have the means at hand of studying the adaptations of structure and conformation to circumstance.

Hard by is the bog-garden, where the same principle is carried out on a larger scale. Bamboos encircle this morass, which is filled with an assortment of interesting plants, among them huge masses of *Saxifraga peltata* and *Oncoclea sensibilis*, *Primula rosea* and *Mimulus luteus* (thriving exceedingly), *Juncus spiralis*, which last, we were informed, reproduces its contorted form in the seedlings, and many more.

The Natural Orders are represented in irregular beds of varying size according to the number and importance of the members. This method of disposition is preferable on all accounts to the gridiron arrangement, as it allows a better idea to be formed of the importance and variety of the Order and of its affinities to neighbouring groups, while it is far more pictorial, and allows the "habit" of each plant to be more fully developed.

Here may be mentioned a curious fact that the hybrid between *Senecio squalidus* and *S. vulgaris* seeds itself, and those seeds reproduce the parental features. Who shall say then that hybrids may not be the progenitors of "new species"?

Speaking of hybrids, we are reminded of a series of hybrid *Gerberas* raised by Mr. Lynch, and from which much may be expected. In many a corner, indeed, we come across hybrids or plants grown for experimental purposes, grasses which have furnished Professor Marshall Ward with the material for his remarkable paper on the parasites of *Bromus*, or pans filled with rare Hepatics, grown to satisfy the curiosity of students and to furnish the information they are seeking. Everywhere evidences of the garden being put to uses such as befit a botanic garden, at the same time there is ample to interest and please the ordinary lover of plants and flowers, whose requirements are not so exacting as those of the research-student.

We append a few notes from the lately issued Annual Report of the garden, from which it will be seen that our hasty notes might have been largely extended:—Among the more interesting plants that have been received are *Lachnanthes tinctoria*, specially obtained through the New York Botanic Garden, a species yielding a drug supposed to be efficacious in bronchitis and tuberculosis, recently investigated by Dr. P. W. Latham (see *Chemist and Druggist*, July 12, 1902); *Mystacidium* sp. nov., contributed by Mr. Cyril Crossland, of Clare College, and

collected by him in British East Africa; *Coriaria japonica* (*Bot. Mag.*, tab. 7,509), remarkable on account of the brilliant red colour of the fruiting sepals, which give the effect of red berries; *Spiræa millefolium* (*Bot. Mag.*, tab. 7,810), a species with finely-divided foliage; *Scolopendrium vulgare* × *Asplenium ceterach*, a supposed bi-generic hybrid; *Corydalis thalictrifolia*, one of the new introductions from China; *Iris gracilipes*, a pretty species, and the only *Iris* of the section *Evansia* that, until recently, had not been introduced; *Ceropegia debilis*, a curious new species; the Wild Fig, or *Caprificus*, specially inquired for and introduced for the first time into this country (see Kerner & Oliver, *Natural History of Plants*, vol. ii., p. 160, fig. 240, p. 157); *Rodgersia pinnata* (*Bot. Mag.*, tab. 7,892); *Acanthus arboreus*, one of the finest plants of Arabia Petraea, whence it was sent by Professor Schweinfurth (*Gardeners' Chronicle*, April 5, 1902, fig. 70); *Primula megaseæfolia*, an interesting addition to the genus, from Pontus, in Asia Minor; several new Chinese trees, including *Liriodendron chinense*, *Magnolia Delavayi*, *Gleditschia Delavayi*, and one or two probably new Pines, the interesting Chinese herb *Podophyllum versipelle*; *Rehmannia glutinosa*, and *Rhus vernicifera*, the latter a small Japanese tree which yields the famous lacquer used for articles of furniture and small ware.

Among new plants that have flowered, and have been or will be published from Cambridge material are *Mystacidium* sp. nov., received from Mr. Cyril Crossland, of Clare College, and collected by him in British East Africa; *Sauromatum* sp. nov.; *Streptocarpus Armitagei*; *Colchicum* sp. aff. *montanum* (to be figured in the *Botanical Magazine*); and *Gerbera* "Brilliant," a cross between *G. Jamesoni* and *G. Sir Michael*, raised by the Curator, and finer than either parent in size and colour. Other new plants that have flowered are *Pittosporum Fairchildi*, an ally of *P. crassifolium*; *Campanula sulphurea*, exceptional in the genus in the colour of the flowers; *Arisæma mirabile*, probably a variety of *A. speciosum*; *Stapelia luxurians*, an interesting example of carrion flowers; and various hybrid *Gerberas* raised by the Curator.

The Botanic Garden has assisted, by the supply of material, in an investigation by Mr. H. A. D. Jowett, D.Sc., and Mr. G. E. Potter, D.Sc., of the Wellcome Research Laboratories, Snow Hill, London, on the "Variations in the Occurrence of Salicin and Salinigrin in Different Willows and Poplar Barks." The results of the investigation have been published in the *Journal of the Pharmaceutical Society*, August 16, 1902. As the Cambridge Botanic Garden possesses a well-authenticated collection of Willows, assistance has been given also to a gentleman desirous of determining the kinds of Willow required by hat-makers, for planting on his estate.

THE BIRMINGHAM BOTANIC GARDENS.

AFTER serving faithfully and well for thirty-six years as Curator of the Birmingham Botanic Gardens, Mr. William Bradbury Latham is about to retire; and we hope that he may live for many years to enjoy the rest he has so well earned.

Mr. Latham was born at Bicknacre, near Maldon, Essex, in 1835. At the age of thirteen he commenced work in the garden of W. McNeil, Esq., Wandsworth Common, and subsequently became apprenticed for three years to the late Robert Neal, of the old Wandsworth Common Nurseries, part of which exist still.

He next entered upon employment at the Royal Gardens, Kew, where he spent a period of two years and several months. The next move was to Chatsworth, Mr. Latham being desirous of studying for a time under the late Sir Joseph

Paxton, who subsequently interested himself to get Mr. Latham into the Jardin des Plantes, Paris, where M. Neumann was then the curator. Returning from Paris, Mr. Latham spent six months in the Holloway nurseries of Messrs. Parker & Williams, and left this establishment

MR. WILLIAM BRADBURY LATHAM,
Retiring Curator of the Birmingham Botanic Gardens.

to become head gardener to Lieut.-Col. Perkins, Birtley Hall, Chester-le-Street, Durham. At this place Mr. Latham had charge for eight years of one of the finest collections of Orchids and stove and greenhouse plants in the North of England.

In December, 1867, Mr. Catlin, Curator of the Birmingham Botanical and Horticultural Society's garden, retired after twenty-one years' service, and Mr. Latham was selected to succeed him.

MR. THOMAS HUMPHREYS,
Newly-appointed Curator of the Birmingham Botanic Gardens.

One of the first things the new Curator had to do under instructions from the Committee of the garden was to destroy one of the best collections of *Cratægus* and other Rosaceous trees and shrubs in the United Kingdom, for the purpose of making an archery ground. Mr. Latham deeply regretted this; but in other directions he quickly increased the collection of plants, two new glass-houses were built, and later the large and hand-

some conservatory was erected. Other improvements being needed, an appeal was raised for funds (£4,000 was obtained), and in 1885 a large portion of the old structure was pulled down and an extensive block of new glasshouses built.

Mr. Latham, in 1862, raised a hybrid *Dicksonia* from *D. arborescens* (St. Helena) and *D. antarctica* (Australia). *D. Lathamii* is now a splendid plant, as is also a hybrid Fern raised by Mr. Latham from *Cyathea insignis* and *Alsophila excelsa*. Mr. Latham was presented with a Veitch Memorial Medal by the trustees of the Veitch Memorial Fund, at a meeting of the Royal Horticultural Society on May 7, 1901.

An account of the history of the garden and a description of its contents in 1893, by Mr. F. W. Burbidge, was published in the *Gardeners' Chronicle* for December 9, 1893, and a supplementary illustration to the same issue afforded a view of the Tree Ferns growing in the new conservatory. Soon after the establishment of the garden Messrs. Knowles & Westcott published *The Birmingham Botanic Garden, or Midland Floral Magazine*; and this was succeeded by *The Floral Cabinet and Magazine of Exotic Botany*, of which three volumes were published, illustrated with nearly 200 coloured plates and some wood engravings.

THE NEW CURATOR.

We have great pleasure in publishing a portrait of the newly-appointed Curator, Mr. Thomas Humphreys, the well-known and universally esteemed Assistant-Superintendent of the Royal Horticultural Society's gardens at Chiswick. Mr. Humphreys commenced his gardening career at Chester, in his native county, and served for five years in the nurseries of Messrs. Jas. Dickson & Sons, Newton Nurseries. Owing to the knowledge of hardy trees and shrubs obtained in these celebrated tree nurseries, Mr. Humphreys was recommended to the Royal Gardens, Kew, in 1887, to take charge of the propagating department of the arboretum. Those best acquainted with the magnificent collection existing at Kew may imagine the opportunities that presented themselves in the propagating department of the arboretum for acquiring a perfect knowledge of this interesting section of plants, the use or misuse of which affects almost permanently our gardens and landscapes.

Mr. Humphreys left Kew in 1892, and became Assistant-Superintendent in the Chiswick Gardens. This was three years before the retirement of Mr. A. F. Barron, for whom Mr. Humphreys entertained great respect. He has since co-operated loyally with the present superintendent, Mr. S. T. Wright, in carrying out the work of the gardens, and of the meetings and shows at the Drill Hall, Temple Gardens, Crystal Palace, and Holland House. Mr. Humphreys has also acted in the capacity of secretary to the Floral Committee for the past nine years.

The experience gained at Chester, at Kew, and at Chiswick in working up stock of different species of indoor and outdoor plants will greatly help Mr. Humphreys in his new position, whilst his intimate experience in the promotion and management of the Royal Horticultural Society's shows will be scarcely less valuable.

Mr. Humphreys's task will not be a light one. There exists in Birmingham an amount of indifference that is most prejudicial to the interests of the Botanic Garden and of Birmingham horticulture generally. The Society's finances are not altogether satisfactory, and the immediate policy should be one that will reawaken an enthusiasm in the city for the future of the garden; and by making the garden as attractive as possible to the members of the Society, shall succeed in permanently increasing the number of its supporters. The Curator should not be hampered by lack of funds.

Professor Hillhouse, who has been secretary to the Society for many years; Mr. Neville Cham-

berlain, treasurer; and the Committee, of which Professor Poynton is chairman, are determined to do their best to place the gardens that John Claudius Loudon made in 1831, upon a basis that will do credit to its traditions; and it is earnestly hoped their efforts will meet with success.

Mr. Humphrey's removal from London will be much regretted by those who attend the meetings of the Royal Horticultural Society, and have experienced his invariable courtesy and kindness; but they will wish him a most successful and happy career in his new sphere of work. Like Mr. Latham, the retiring Curator, Mr. Humphreys is a member of the Kew Guild.

HOW PLANTS SCATTER THEIR SEEDS.

THE pageant of flowers, with all their varied, almost infinite tints and scents, forms and sizes, which we witness with unbounded interest and joy from the earliest spring to the latest summer months, will not be long before it draws to a close. From the Snowdrops and Daffodils amongst the leaders of the procession, to the Scabiouses, Hawkweeds, and Thistles amongst those which bring up the rear, there has been a constant succession of forms. The flowers had their brief reign, and died, were replaced by others not less beautiful and attractive than they; and these again by yet other dynasties of floral kings and queens—not a break in the whole long line of beings, until the summer sun shall fail of warmth and light, and autumn's more sombre season usher in less genial days.

What is the meaning of this cycle in the necessities of plant-life, this fixed period for the flourishing of each species in the vegetable world? The study of the mysteries of the phenomena of plant-life teaches us that a flower, as regards all its qualities of colour, scent, form, and size is a special adaptation of certain parts or organs of a plant for the attainment of the whole ideal of its life—viz., the production of progeny, the perpetuation of its species. The "flower" is the instrument whereby the opposite sexual elements are brought together and blend to build up the new individual. External agents in the form of insects are the most usual means to this end, and these winged messengers are busied in carrying the male element, contained in the pollen, of one flower to the female element, contained in the ovule of the other flower. That this work may be accomplished, these insect-agents must be first attracted to the plant, then encouraged by something which will induce repeated visits. The first of these requisites is afforded by the form, colour, and scent of the modified organs of the plant, and thus the "flower" comes into existence, pleasing to our human as well as to the insect senses. The second requisite is supplied by the honey and pollen, both serving as valuable and attractive food for the winged visitants. But besides these wonderful agents of fertilisation in the form of organised creatures, there is another, the wind, which plays the same though a more uncertain rôle in accomplishing the same end.

Now, that great agent of the hidden life-principle of the world, natural selection, has so distributed the periods of the flowering of the various forms of plant-life, and also of the activity of the various types of insect organisation, that there shall be a minimum of competitive struggle, and hence of the number of species of plant or insect flourishing at the same time of year. So that the great struggle for existence has caused many a flower and insect (for both these lines of organised life are interdependent the one upon the other) to reach their maturity in the earliest spring months, when the frosts of winter have barely relinquished their deadening grasp; others in the height of summer;

while yet others are forced to develop to their fullest in autumn's latest, darkening days. This distribution of the flowers through the varying seasons is thus the inevitable outcome and expression of the mighty struggle of each species of plant for the most adequate and surest means of fertilisation, and therefore of the perpetuation of its kind.

This act of fertilisation having resulted in the formation of seed, the next question which the plant has to solve is this: How to distribute that seed, each grain of which contains within itself the potentiality of a new individual plant.

Now, the first great condition on which the proper distribution of the seed depends is this—its dispersal over as wide an area and one as distant from the parent-plant as possible, so that the seedling plants shall have new soil and varied environment in which to start their life, for the greater the variation in the environment the greater the likelihood of fresh variation in the species, and of the eventual formation of a new species to people the earth. For if the seeds were merely to drop close round the parent plant, baneful results would follow, from two causes: the soil would probably be soon exhausted by the numerous thick-sown progeny springing up all round, and the overcrowding of the seedlings would cause many a one to go to the wall and perish by the fierce battle for existence which would ensue; whereas the wide scattering of the seeds would enable very many more to survive. Hence the phenomenon, which in the autumn or late summer comes especially before our eyes, of the preoccupation of all trees and herbs in the business (very vital to them) of dispersing their seeds in the way most advantageous to them.

It is of some of these methods of seed-distribution, as found amongst our native flora, that I propose now to treat; and it is extremely interesting to the lover of Nature to note the varied and ingenious means which plants have adopted to further their desired ends.

There are a large number of plants which rely entirely upon the smallness and lightness of their seeds or fruits for their adequate distribution, the wind being the agent employed for this object. In some, as in the Foxglove, the dry capsule simply splits open by its valves from top to bottom, thus liberating the seeds, some of which will doubtless be blown by the wind to some considerable distance from the parent plant. In others, as in the Stitchworts and Chickweeds, the capsule opens at the top only, by numerous small teeth, the seeds being shaken out between these latter. The Poppy forms square apertures all round the large swollen seed-vessel, just beneath its hard, flattened dome, and through these the very numerous small seeds are shaken out and scattered to some considerable distance as the wind sways the tall stalks of the capsules backwards and forwards. In the Harebell and other bell-flowers, or Campanulas, curious "windows" are constructed, either in the upper or lower part of the seed-vessel, by the obliteration of a small area of the tissue of the wall, and through these, as in the Poppy, the tiny seeds are shaken rudely out by the wind. Among other plants producing these small, light seeds are the Orchids, whose seeds are like dust in fineness, a single grain of the rare Scotch Orchid *Goodyera repens* having been found to weigh only 0.000002 gramme; also the Pyrola, Grass of Parnassus, Sundew, Sedums, Saxifrages, Rock Rose, Gentians, Purple Loosestripe. The common garden Scarlet Pimpernel has a globose capsule, opening, when ripe, transversely by a lid, thus liberating the light seeds. The lower orders of the vegetable kingdom, the Ferns, Mosses, Fungi, &c., produce seeds or spores far smaller and lighter than the seeds of any flowering plant, and which can thus travel immense distances on the wings of the wind. The obvious advantage of the produc-

tion of seeds of this class lies in the fact that great numbers can be produced by a single capsule.

Other plants, relying upon the same method of distribution, never set free their seeds, but each grain remains enclosed in a very small and lightly-constructed seed-vessel, easily detached from the stem, and transported by the wind, just as are the small seeds. Those which have adopted this course are the Nettle, the Mallow, the Labiate tribe, including the Sage, Mint, Thyme, Balm, Wood Germander, Bugle, Horehound, Dead Nettle, Betony, Ground Ivy, Self-heal; several of the Umbelliferous family, as the Celery, Hare's-ear, and Burnet Saxifrage; some Composites, as the Wormwood, Daisy, and Feverfew. In the plants so far considered, the fruits and seeds have no specially obvious adaptation in the shape of any modified or added structure to ensure their transportation by the wind; a simple diminution in size is what has chiefly taken place.

Very different, however, is the case of the next category to be described, in which special structures are found on the fruits or seeds which facilitate their dispersal by the wind. The first of these structures are the "wings." In seeds, the "wing" is usually the attenuated, enlarged margin of the flattened body, whose area is greater than that of the essential part of the seed, and the centre of gravity is so placed that the broad side of the seed is presented to the direction of its descent, thus enabling it to be the better buoyed up by the wind. Such a flattened seed with its broad membranous wing is clearly well fitted for carriage by the breeze. Examples of winged seeds are afforded by the Cow-wheat, Iris, Wallflower, Tulip; likewise by the Pine, Spruce, and Larch, &c., where the winged seeds are tightly enclosed in the compact woody cone, only to be liberated on the breeze when in the dry autumn or late summer days the scales of the cone part asunder and the seeds fall out.

Far more common, however, are winged fruits. How familiar on autumn days are the gyrating winged capsules of the Sycamore floating through the air; and no one can doubt that the large, veined, membranous "wing," a special outgrowth of the upper part of the seed-vessel, is eminently serviceable in scattering the fruits of the Sycamore and Maple far and wide. Scarcely less useful for this purpose must be the "wings" exhibited by the numerous fruits composing the "keys" of the Ash, although here the individual fruits and "wings" are smaller, but constructed on the same plan. Well known are the light green winged fruitlets of the Elm, as they fall from the trees in the early summer months. Here the broad, membranous "wing" surrounds the entire fruit, and is prettily veined. In the Umbelliferous family, the Wild Angelica and Cow Parsnip afford instances of flattened capsules with either a single or several longitudinal membranous wings, the general plan of structure being exactly that of the winged seeds. Similar instances are afforded by the Shepherd's Purse, Penny Cress, and Mountain Sorrel.

The necessary wings are often provided by the bracts or floral envelopes immediately surrounding the fruit. On any windy day in Epping Forest it may be seen how the large three-lobed bract, bearing the fruit in its hollow base, has successfully usurped the function of a wing in the transportation of its precious freight. The Meadow Grass, Canary Grass, and Soft Grass distribute their fruits by the wings on the paleæ or inner glumes. In several plants the corolla, calyx, or the green perianth constitute the wings, as in the Saltwort and Orache of our shores, the common Dock, the Milkwort, with its two large, persistent purple sepals, and some species of Clover. *W. C. Worsdell, F.L.S.*

(To be continued.)

QUEENSLAND PALMS.

OUR illustration (fig. 23), for which we are indebted to Mr. Bailey, the Colonial Botanist of Queensland, shows what he calls a "Scrub View," which might create envy in the minds of those who have to arrange a tropical-house in this country. The tall Palms to the left are *Archontophoenix Cunninghami*, with *Calamus Muelleri* in the foreground. The taller Palm has been figured as *Seaforthia elegans*, *Botanical Magazine*, 4,961, but differs in various particulars. The stems attain a height of 60 to 70 feet; the pinnate leaves measure 6 to 8 feet in length, each pinna linear, about 18 inches long. The Palm is fully described in Bailey's *Queensland Flora*, Part 5 (1902), p. 1,675.

ALPINE GARDEN.

THE SPECIES OF RUBUS.

THE genus *Rubus* is one which affords the gardener much valuable material, though it is not to be wondered at that the plants it yields have been more appreciated for their fruit than for their decorative value. Yet this has not gone unobserved, and many gardens are now enriched by these fine Brambles and allied plants, whose flowers and effective habit give attractions wherever they are grown. Of all the plants of the genus, hardly any receive so little notice from the cultivator of hardy flowers as the few dwarf Brambles and Raspberries, of stature sufficiently diminutive for the rock-garden. Generally of simple cultivation, they are usually pleasing in their foliage and pretty in bloom, the flowers being sometimes followed by attractive little "berries," grateful to the eye and often pleasing to the taste. Of two or three of these I desire to speak.

Rubus arcticus.—One of the most delightful of these is the Arctic Raspberry, or Bramble, as *Rubus arcticus* is colloquially termed, a widely distributed plant in Northern Europe, Asia, and America, extending far into the Arctic regions, and standing unharmed the rigors of such a clime as these northern lands afford. It delights in peat bogs and damp woods, but it adapts itself well to other conditions, and will thrive and flower quite happily in drier positions, such as those afforded by the base of the rockeries, where the moisture from above can reach its roots. It is a delightful little plant, often dioecious, with pretty little pink flowers, the berry-bearing plants producing delightful little light-red edible fruits, exquisitely fragrant. They are pleasant to the taste, being prized by Swedish epicures, and a few placed in a saucer are quite sufficient to scent a whole room. It may be observed for the sake of those who wish the fruiting plant that it is generally known in nurseries as *R. arcticus fœcundus*. The leaves are usually trifoliate, though sometimes five-foliate. The whole plant is only a few inches high, its height varying from 3 to 8 or 9 inches. It is increased by division or seeds.

Rubus chamæmoris.—Another beautiful little Bramble for the rock-garden is *R. chamæmoris*, the Cloudberry, which is also sometimes called the Mountain Bramble, Mountain Raspberry, or Knotberry. It also is widely distributed over Northern Europe, Asia, and America, and it is well known to climbers of our own mountains, where it flowers in July. The flowers of this pretty native plant are of a comparatively large size, and are succeeded by its pretty edible red fruits, which are greatly appreciated by many, and form a valuable food for the Laplanders and Norwegians, who sometimes preserve them by a kind of "cold storage" by burying them in the snow. The leaves are five to nine-lobed, while the flowers are dioecious. This species prefers a

damp soil, but is easily accommodated in the rock or bog-garden.

Rubus saxatilis.—This is one of the least desirable of the dwarf members of the genus, though it is not a tall grower, its general height being from 8 to 10 inches. The small-petalled flowers are a greenish-white or yellow, and the fruits are composed of a few large red clustered drupes. The habit is erect, and the plant is more suitable for stony ground than the two already named.

and we are referred to "*Sm. Pl. Ic. Ined.*, t. 63." I have not access to that work, so that I cannot compare my specimen, procured from Mr. Smith of Newry, with it. I have no reason, however, to doubt its correctness, and I have seen the plant flower for the first time this year with great pleasure. It is a low creeping *Rubus* with five-foliate leaves and attractive little white flowers about an inch across, which at first sight resemble those of a small wood Anemone. I look upon it

FIG. 23.—ARCHONTOPHENIX CUNNINGHAMI, WITH CALAMUS MUELLERI IN FOREGROUND, IN BRISBANE BOTANIC GARDENS.

The leaflets are ovate. *R. americanus* of Britton is considered by some a variety of *R. saxatilis*, and is *R. s. var. canadensis*, Michx., and *R. s. var. americanus*, Pers. One cannot consider this species worthy of being included in a select collection of such plants.

Rubus pedatus.—Unlike *R. saxatilis*, *R. pedatus* is one of the most desirable of the dwarf Brambles. It does not appear to be well known, and I cannot find any allusion to it in current works of reference, except that it is named in the *Index Kewensis* as a native of North-west America,

as the prettiest of these low-growing Rubi for the rock-garden. The weather this season was unfavourable for its fruiting, but from each flower there are a few small drupes of a dull red. I am cultivating it at the base of a rockery in much the same position as *R. arcticus*, and it is slightly dwarfer than that species.

Rubus xanthocarpus.—By way of Italy I received about a couple of years ago the Chinese *R. xanthocarpus*, which is of creeping habit and grows from 8 to 10 inches high. It is rather a pretty Bramble with long, light-green leaflets in

three, and large white flowers followed by yellow fruit. Even did it never flower this would be a pleasing plant for the rock-garden, although it is exceedingly prickly and not at all agreeable to handle, so penetrating are the hook-like prickles. It seems hardy enough. It is said to have been introduced in 1892, but it does not appear well known to the few growers of the dwarf Rubi in this country. *S. Arnott, Rosedene, Carsethorn by Dumfries, N.B.*

FLORISTS' FLOWERS.

CARNATION FRANCIS SAMUELSON.

(SEE ALSO P. 60.)

This fine seedling Carnation, which was awarded a First-class Certificate at the recent York Show, is undoubtedly the best of the apricot-coloured section of border Carnations yet raised. The colour is a particularly rich shade of apricot, deepening towards the centre of the flower, which is of large size, with smooth even petals regularly arranged.

Having seen this Carnation growing last summer along with several other choice seedlings, I can congratulate the raiser (Mr. George Brotherston) on securing such a desirable variety. Ereckenborough Hall, where it originated, is the Yorkshire residence of Francis Samuelson, Esq., a popular squire in the North Riding of the broad county, and one who takes a keen and lively interest in his gardens and estate. The gardens in particular, at the time of my visit, were specially interesting, the Carnations and Sweet Peas being very fine. *T. H. Bolton, gr., Baron Hill, Beaumaris.*

THE ROSARY.

THORNLESS ROSE ZEPHYRIN DRONAN [?].

I SEND flowers of this, to my mind, lovely Rose, very seldom seen, much less grown or known. It forms a suitable variety for covering a low wall, and is, in wet and cheerless weather, in flower before all others. *W. C. Leach, Albury Park Gardens, Guildford.* [We are unable to find the name of this Rose in any official list. ED.]

The Week's Work.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury.

Lælia anceps.—This plant being now in active growth, it should be afforded water at the root freely, also syringings morning and afternoon; and if possible shading should be removed early in the afternoon, sunheat by day and conditions comparatively cool and moist by night suiting it best.

The Odontoglossum House.—During very hot weather everything possible should be done to keep the air of this house a few degrees lower than that of the external air; and but little difficulty is experienced in so doing when the house is a lean-to facing north or north-east. When, however, a house is span-roofed and runs north and south, fully exposed to the sun all day long, coolness is attained with difficulty in the daytime. At Westonbirt we have such a house, and double blinds have to be employed during the warmer hours, and the floor, paths, &c., kept wet by distributing water twice daily.

Lælia Digbyana.—The requirements of this species has been much better understood of late years than formerly, and it has been proved that more satisfactory results follow when it is cultivated in a leaf-soil compost similar to that used for Cattleyas than when the usual thin layer of peat sphagnum and crocks is used; and the leaf-soil compost will build up strong flowering growths if due care and attention be afforded. When our plant starts into growth early in the year, it is removed from its resting quarters to a house where a genial growing temperature is maintained, and as growth advances the quantity of moisture afforded the plant is increased, moisture being much needed when growth is taking place, especially at the time when the pseudo-bulbs are forming. As soon as the flower-spikes become visible, the plant is placed in the Cattleya-house, in which house it remains till the flowers expand. When the flowers are removed, it is put into a very light position, and a long rest afforded.

Potting.—*Lælia Digbyana* may be repotted at this season, or when starting into growth next

year, the former being preferable, new roots now being emitted by the pseudo-bulb last formed. A compost identical with that recommended for Cattleyas in an earlier Calendar may be made use of, the usual surfacing of clean sphagnum being given. Either a pan for suspending from the roof or a pot for standing on the stage may be employed, but these must not be any larger than is absolutely necessary; the drainage must be very good, and the potting materials moderate in quantity. A repotted plant requires great caution on the part of the gardener in affording water, the potting materials being just maintained in slightly moist state. When re-established treat it in the same manner as a plant which has not been disturbed at the root, affording no more water whilst it is resting than will keep the roots healthy and pseudobulbs plump.

FRUITS UNDER GLASS.

By T. H. C.

The Pine Stove.—The recent warm weather has favoured the growth in the plants, it having been possible to afford full ventilation, and to husband the sun-heat at closing time, and thus reduce expenditure on fuel. At closing time syringe the plants lightly, and allow the temperature to rise with solar heat to 90°. The warmth at night should not exceed 70°. Damp down more or less as may be required. Young plants in a growing condition should not lack water at the roots, or growth will be stunted; on the other hand, a very wet state of the soil should be avoided. Plants intended for fruiting in the winter, which have been rested during the past month, should now be afforded tepid water copiously, and a higher top and bottom heat, in order to induce a start. If the bed is cooling unduly, let the materials be renewed in part, so as to carry the plants through the fruiting period without further disturbing them. The bottom-heat may range from 85° to 90°. Plants now in flower should be afforded a dry atmosphere, and not be wetted till flowering is past. When the flowers are set, apply manure-water when moisture at the root becomes necessary. Ripening fruits require a considerable amount of air, a high temperature, a dryness in the surroundings, and only clear water at the root, the quantity of which must be reduced as the fruits approach perfect ripeness.

Figs.—Trees with fruit ripening should be afforded air freely so as to ensure good flavour, making sure that the soil is not dry. Such of the trees as are carrying a heavy second crop of fruit will require to have the fruits thinned, and if large fruit be desired leave only two or three of varying sizes on a shoot. Regulate the shoots so that there is no overcrowding; cut away all unnecessary growths or those that shade the principal bearing shoots. The above remarks apply to Figs in pots now carrying a second crop of fruit. Much vigilance is needed in applying water betimes, so that no risk is run from dryness of the soil; and at this season water may be needed twice daily. An occasional dressing of sulphate of potash well watered in, and daily applications of weak farmyard liquid-manure are very beneficial. Syringe the plants vigorously morning and afternoon or red-spider will increase. Ventilate freely when the weather is favourable; close early, and with sunheat let the temperature rise to 85° or 90°; the night warmth may range between 65° and 70°. Trees in pots intended for forcing early next year should receive similar treatment at the roots so as to enable them to make strong shoots. It is important that the shoots be thoroughly matured by the end of the month of September.

THE FLOWER GARDEN.

By J. C. TALLACK, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

Layering Carnations.—Early layering is an important point, more especially if the rooted layers are to be planted direct to the beds or groups where they are to flower. If transplantation be done in October, and the layers are well rooted, they become established before the winter sets in. Late layering and coddling the plants through the winter in pots under glass are things to be deprecated, it being a cause of failure with border Carnations. In all the earlier parts of the country the layering of Carnations may now be undertaken. Let

NOTICES OF BOOKS.

LE LIVRE D'OR DES ROSES.

THE second part of this new Rose-book has recently appeared. As in the previous part the letter-press is interesting, the type excellent, and the small woodcuts here and there introduced are daintily executed, but the leading feature of the work, the gallery of portraits of the various types of Roses, is disappointing. In the first place most of the varieties depicted are now, at all events in England, seldom if ever grown. Out of the fifteen coloured illustrations of Roses in the present part only seven varieties are to be found in the latest edition of the National Rose Society's official *Catalogue of Exhibition and Garden Roses*—viz., Prince Camille de Rohan, Cristata, Madame Gabriel Luizet, La France, Marie Baumann, Eugénie Verdier, and A. K. Williams. But even of these, the more modern varieties, the latest was sent out as far back as 1877. This would not be so much a matter for regret if the portraits themselves could be regarded as faithful representations of the Roses selected, as then they would serve to illustrate to some extent the advances made in the Rose-world during the last thirty years. Unfortunately, the flowers are not drawn to the same scale, so that a fine exhibition variety like A. K. Williams is made to appear quite a small Rose when placed beside the portrait of Marie Baumann, while its perfectly imbricated form has almost entirely disappeared. Then, again, the stem of Madame Gabriel Luizet is represented as perfectly smooth, whereas in reality it is thickly covered with sharp spines, while the thorns on Marie Baumann appear to be all of the same size, instead of a mixture of small and moderately large thorns. Coloured illustrations of the Queen of Flowers are seldom satisfactory, but one might have hoped to see in a gallery of Rose portraits of the extent attempted in this rather ambitious work truer and more uniform representations of the varieties depicted, even if the colouring, as usual, fell short of what could be desired. *Edw. Mawley.*

HANDBUCH DES LAUBHOLZ-BENENNUNG (Berlin: Paul Parey).

THIS work, compiled by Messrs. Beissner, Schelle, and Zabel, includes a systematic as well as an alphabetical list of trees and shrubs other than Conifers which will endure the winters of Germany with little or no protection. The plants are arranged according to the system of Engler and Prantl. To each the adopted name and the principal synonyms are appended, with the name of the author, but no indication of the book in which published, and no reference to figures. With a view to show the thoroughness with which the work has been compiled, we note that the common *Berberis* has some thirty synonyms referred to it, besides some eighteen or twenty "formen" and "unterformen," and nine hybrids.

The value of a book of this kind can only be fairly estimated after frequent use, and it is probable that the views of the authors as to the identity and synonymy of the species might not always be shared by others. But this, of course, is quite inevitable. What is quite certain is that the book will be found indispensable to those whose business it is to study trees and shrubs.

a mixture of turfy loam, a year or longer time in stack, a small quantity of leaf-mould, and sufficient road-grit as will render the whole gritty to the touch, he got in readiness for the work, and after scooping out some of the soil, place round the plants to the depth of about 2 inches some of this mixture, and make the surface flat. Having done this, select three or four layers from each plant (never all the shoots), but leave some to keep the roots at work. In pegging down the layers see that the tongue of the layer is kept well open [old growers put a grain of wheat under it. Ed.], and make the soil firm round each layer, finishing off level; and if the weather be dry syringe them in the afternoon. Apply water to settle the soil, and generally keep the layers moist. By attention to these details roots will quickly form. I may add one word of caution. In dealing with new varieties of promise never discard an old favourite variety till it has been proved that the novelty of the same colour is a better flower, and the equal of the old variety in regard to constitution.

Iris.—Most of the winter or very early-flowering Irises, as *I. reticulata*, *I. alata*, *I. stylosa*—*unguicularis*, *I. persica*, including the new *Helldreichi*, should be planted as soon as possible; and flowering as they do when the weather is usually ungenial, sheltered positions should be chosen for them. If they can be covered with glass in some way, these Irises usually succeed, and the blossoms last in good condition for a considerable length of time.

Dahlias.—The shoots of the Dahlia being easily damaged by the wind, the plants should be gone over at short intervals of time, and fastened to the stake or stakes. Varieties of Cactus Dahlias which have a tendency to hide their flowers under the leaves when allowed to grow naturally, should have the upper shoots removed from around the flower-buds, and be disbudded as well if blooms are required for exhibition. Earwigs will now infest the plants, and they should be trapped in short lengths of Bamboo or Broad Bean-stalks placed among the branches, these being less unsightly than the usual flower-pots stuffed with moss or hay.

Violets.—Thoroughly syringe these plants daily, and afford them water abundantly when the soil has got dryish, doing this, and applying a mulch of leaf-mould or decayed stable-dung, so as to keep red-spider in check. In syringing, use an elbowed nozzle on the syringe, so as to get the water on to the lower sides of the leaves.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bioton, Budleigh Salterton, Devonshire.

Chrysanthemums.—The plants require much attention in regard to the state of the soil in the pots, three times a day being not too often to examine them. Whether water is or is not required may be ascertained by rapping the pots with the knuckles. As soon as the roots are seen to be working round the side of the pot, drainings from the cowyard, one of the best manures, or deer's or sheep's dung in the form of diluted mixtures with water, together with soot, may be applied once a week. With the exception of the early-flowering varieties the flower-buds should be removed from them until about the middle of next month, one or more growths being allowed to extend. Secure the best shoots so that wind or rain will not break them off; remove superfluous growths as fast as they appear, and syringe the plants after hot days, plying the water on the undersides of the leaves, adding some quassia extract if aphides appear. The plants are looking well and free from the Rust. Should the latter appear on any of the plants let them be isolated, and syringe or sponge the leaves with warm water to which a wine-glassful of petroleum in 4 gallons of the former has been added.

Carnations.—The Tree varieties now standing in the open air on a bed of coal-ashes should have the point of all shoots showing flower nipped out, and the growth secured to neat stakes; and as the pots fill with roots apply weak manure-water or soot-water once a week, soot being a capital manure for Carnations.

Souvenir de la Malmaison varieties of the Carnations, as the plants pass out of flower, may be layered forthwith, selecting the oldest or most leggy for the purpose. Knock them out of their pots and plant them in a cold frame or pit in a bed made up of good loam, leaf-soil, road-grit, or coarse sand. The plants should be laid on their sides, and the soil made firm about them. Then having selected the shoots to be layered trim off the bottom leaves, and with a sharp knife make a slanting cut upward through a joint on the under side of the shoot, and with a hooked peg, and the top of the shoot slightly raised, make it secure in the soil, placing a layer of soil about 1 inch thick over each one. Keep the lights fairly close, and afford shade for a few days if the weather is very bright, but do not apply water for twenty-four hours, which will give the surface of the wounds time to dry, afterwards the soil should be kept fairly moist. Plants intended to be grown on should be given a pot 2 inches greater diameter, and a compost consisting of good turfy-loam two parts, flaky leaf-soil one part, and thoroughly rotten manure (cow-dung if possible) one part, with the usual amount of coarse silver-sand. Pot fairly firmly.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PIGOTT, Bart., Wexham Park, Slough.

Endive.—The plants of the earlier sowings should be blanched when about half grown by tying them up in the same manner as Cos Lettuce, or by covering them with flower-pots, which should be placed firmly on the ground and the holes covered with a piece of slate so that the light cannot enter. The plants should be quite dry when covered. Later sowings should be well supplied with water at the roots. Make a sowing on a south or west border, and if the weather be dry thoroughly apply water to the seed-drills before sowing the seeds.

Lettuce, &c.—Make sowings every ten days or thereabouts of Cos and Cabbage varieties. Bath Cos, Hicks' Hardy White, All-the-Year-Round, and Brown Dutch, are excellent Lettuces for present sowing. Sow on a south or west border, and protect the beds with fish-netting. Afford the earlier sowings water in dry weather, and manure-water between the rows by means of a long-spouted watering-pot if growth is slow. Radish-seed in small quantities should be sown fortnightly, and the beds kept moist.

Dwarf and Runner Beans.—Make a large sowing of French Beans on a south border or other warm spot, applying water to the seed-drills before sowing if the land be dry. Runner Beans should be afforded water copiously, and liquid-manure occasionally. In hot dry soils apply a mulch of rotten manure to the rows, and during hot weather syringe the plants, and thus prevent the casting of the blossoms.

Beetroot.—The early-sown Egyptian Beet should be lifted when of middle size, as if left longer in the ground the flesh becomes stringy. Cut off the leaves all but about an inch, and store the bulbs in sifted coal-ashes on the north side of a wall. Stir the soil among later crops, and in showery weather apply slight top-dressings of artificial manure, in the proportion of nitrate of soda 400 lb., superphosphate 400 lb., and muriate of potash 100 lb. per acre.

Globe Artichoke.—Remove the heads when sufficiently large for use and before the stalk gets stringy, and store in a cellar with the butt ends of the stalks in a vessel of water. Afford manure-water to the plants, so that growth may be maintained for as long a time as possible.

Pot Herbs.—Cut these as the plants come into flower, and thoroughly dry in an open shed; afterwards wrapping each separately in small bundles in sheets of thin brown-paper, and hanging them in a dry place.

Celery.—Break up the soil finely and earth-up loosely, taking care not to bury the heart-leaves of the plants. Do not carry out the work in wet weather. Encourage late Celery by affording water copiously at the root and overhead in dry weather. If the Celery-miner is troublesome, hard picking must be resorted to, and the infested

leaves burned. Frequent dustings of soot applied in the early morning are beneficial to the plant, and act also as a deterrent to the fly. Beds of Celeriac should be kept clean; suckers should be torn off, and the plants kept well supplied with water.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

The Peach.—The fruits of Alexander, Waterloo, and Early York being now approaching ripeness on trees growing against south walls, the leaves that shade the fruits should be pushed aside for the purpose of heightening the colour and improving the flavour. In districts in which there are many blackbirds and thrushes, the fruits must be protected with fish-netting. If when gathering the fruits a piece of wadding is held at the back of the fruit, the bruising of the latter will be prevented. Peaches will keep for two or three days in a cool room if placed on sheets of wadding. Most early Peaches are lacking in flavour, but in a season like the present one, when dessert fruit is scarce, the fruits are not to be despised.

Apricots are ripening fast, and the gardener should examine his trees almost daily, gathering such as are ripe. Apricots keep much longer than Peaches after being plucked if carefully handled and kept in a cool room. The nests of the common wasp are not numerous this season, still, if any queen wasps are found they should be destroyed. Gas-tar may be employed in destroying nests, and where the use of this is impracticable Davis's Wasp Destroyer may be used instead.

Gooseberries.—Nets should now be placed over the bushes, for the early varieties are ripening fast. At Dropmore the crop is a heavy one, and of fine quality. When Gooseberries are grown as cordons on north or east walls (an excellent method of prolonging the season), the fore-right shoots should be cut back to 6 inches in length, and the leading shoots secured to the wall before the nets are fixed up. These remarks apply also to Red and White Currants grown on walls.

THE APIARY.

By EXPERT.

The Week's Work.—Swarms should be supered or shallow frames placed on the hives where necessary. Good strong swarms or two lots which have united will be found to have filled up ten frames, and to be quite ready for further work. In districts where food is scarce it will be as well to place the partly-filled sections at the front, and not give them too many sections; but in many places the full number of sections should be given. Straw skeps should have a hole cut in the top, and another skep or super placed over it; before doing which, place a piece of queen excluder, cut a little larger than the hole in the skep, and place it over it, keeping it in place with a few wire-nails pushed through and into the skep below; this will save time and trouble when the honey is ready to come off. In raising the upper skep or super, place under it the bee-escape, which will be found to be very valuable, as the bees escape down it into the parent stock below without any danger of the queen or drones blocking the escape. In all operations have the smoker going and a carbolio cloth in readiness. In an Apiary say of twenty or more hives two smokers should be in use.

Taking-off Sections.—Where these are taken away singly a little patience is necessary, and a good smoker is of the utmost importance in keeping the bees down, to enable you to get a good hold of the sections, which, as a rule, are firmly fastened down. Take hold of the section as far below the top as is possible, and gently pull it towards you, taking care at the same time not to pull off the top of the section, or any part of it. And one often marks the section with the fingers; this should be guarded against, as such sections are spoilt for sale purposes. Keep wax-moth down as much as possible, and continue to keep the Apiary supplied with clean water.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	JULY 28	{ North Kildare Horticultural Society's Show.
WEDNESDAY,	JULY 29	{ Midland Carnation and Picotee Society's Show at Birmingham; Chesterfield Floral and Horticultural Show.
THURSDAY,	JULY 30	{ Irish Gardeners' Association meet.
FRIDAY,	JULY 31	—Royal Botanic Society Lecture.

SALES FOR THE WEEK.

FRIDAY, JULY 31—Established Orchids and Japanese Trees, at Messrs. Protheroe & Morris' Central Sale Rooms, 67 & 68, Cheapside, E.C.
(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—63.4.

ACTUAL TEMPERATURES:—

LONDON.—July 22 (6 P.M.): Max. 72°; Min. 61°.

July 23 (Noon): Overcast, warm; 70°.

PROVINCES.—July 22 (6 P.M.): Max. 69°, Eastern Counties; Min. 52°, Shetlands.

We are so entirely in sympathy with Professor BEACH's proposals that we hasten to submit them to our readers. America is taking the lead in the development of scientific horticulture, if not of decorative gardening; but thanks to the identity of language, and owing to the closeness of our kinship, we can co-operate with her in the promotion of horticulture more fully than we can with Germany, a country which we have also allowed to take precedence of ourselves in this matter.

We must not delude ourselves into the idea that practical gardening and gardening amenities are everything, and that we continue to stand very high, and to take the first place in them. It may be so; but we shall assuredly lose that pride of place unless we are prepared to do as others do, and avail ourselves far more fully than we have done of the resources of science. We are happy in being able to derive from foreign countries that which we cannot produce for ourselves, but there is no reason whatever, apart from our sluggish indifference, why we should not very largely render ourselves independent of foreign aid. The Royal Horticultural Society, to which we look to take the lead and set the example in such matters, devotes itself too exclusively to exhibitions and to the commercial interests of the exhibitors. Its experimental garden is too much given up to trials at which the great commercial houses laugh, and to the culture for distribution among the Fellows of plants which could be bought for a minimum sum from the nearest nurseryman. Research and experiments, on the results of which the future of practical horticulture depends, and the welfare of its devotees, are neglected and ignored, in spite of the recommendations of its own Committees.

When the new Hall is completed we trust that, without any interference with the practical work of the gardens, which is in excellent hands, the establishment of a scientific department under a scientific director, and the reorganisation of Chiswick, will be the next matters taken in hand. The kind of work we have in view can for the most part be done just as well in the suburbs of London as elsewhere, and does not necessitate the formation of a new garden in the country. However desirable that may be—and we should be among the first to admit the desirability—it is not a matter of urgency, seeing that the lease at Chiswick has still many years to run.

So much by way of preface to Professor BEACH's proposal, which we now append:—

"It is proposed that there be organised a society for horticultural science, the object of which should be more fully to establish horticulture on a scientific basis. The membership would naturally be made up of the horticulturists of the experiment stations and of the United States Department of Agriculture, together with other scientists whose work has a horticultural bearing. The meetings would be held in connection with those of some kindred society, as the American Pomological Society, or the American Association for the Advancement of Science.

"The amount of scientific work being done in this country along horticultural lines is not fully appreciated in the scientific world, because in many cases it is obscured in presentation by a large admixture of popular features. In order to put this scientific work in the right light before the world, it must be freed from all distracting elements. Scientific features should be brought prominently into the foreground, and attention focused upon them. The scrutiny to which they would be subjected in this event would doubtless lead to a more complete investigation of some scientific points now imperfectly developed. In bringing about these results, a society for horticultural science would be a potent factor.

"Further, there is a large amount of general scientific work, especially in plant-physiology and physiological chemistry, which has a direct and important horticultural bearing, but which is not making the impress on horticultural investigation that it should do. This work should be reviewed from the standpoint of the horticulturist, and its horticultural applications should be clearly pointed out. This service also the Society for Horticultural Science could perform. Such a society could be made a rallying-point for horticultural investigators, crystallising about itself the scientific horticultural thought of the country.

"One large result of the organisation of this society would be the opportunity that it would afford for the differentiation of scientific and technical from popular features in the presentation of results. The scientific and technical framework of investigation could be presented before the society in the form of memoirs and be discussed in the technical language of the laboratory. At the same time the popular presentation could be rid of all those undesirable technical features, which under the present system are sometimes included, not for the benefit of the practical man, but simply for other investigators. This separate presentation of scientific features would emphasise their importance and tend to stimulate activity in further scientific investigation. That such stimulation is needed our station horticulturists are unanimously agreed. The creation of a society for horticultural science would be a logical and concrete expression of this need.

"This society would not supplant any existing horticultural activities, but would supplement all of them. It would aim to do for horticulture

in general what the Plant Breeding Conference did for one special branch—it would call forth and centralise the most advanced horticultural thought of the day.

"If a sufficient number of favourable replies are received, it is proposed to hold the first meeting in connection with the meeting of the American Pomological Society in Boston, September 10 to 12. If it is decided to organise, all who shall have signified their favourable attitude toward the project will be notified at once, and every effort will be put forth to have a worthy programme prepared for the occasion. The expense connected with the society will be only nominal."

OUR SUPPLEMENTARY ILLUSTRATION to the present issue has been prepared from a photograph kindly submitted to us by the Royal Botanic Society. The view is one in the large conservatory in the Society's gardens at Regent's Park, and will serve as a reminiscence to many of our older readers who may have visited and exhibited at the famous shows of fruit and plants that took place at Regent's Park more than a quarter of a century ago. It is approached from the park by means of a long corridor, in which it has been the custom to hold the spring shows; and when the exhibits could not be contained in this structure the overflow was disposed in various portions of the conservatory. The conservatory was built in 1845 by TURNER, of Dublin, who afterwards built the Palm-house at Kew. Both buildings consist of iron and glass, and therefore admit the maximum amount of sunlight possible; but the Kew Palm-house is much the larger building. At the time the Regent's Park conservatory was built, the gardens were under the care of ROBERT MARNOCK, formerly Curator of the Botanical garden at Sheffield, the site of nearly 20 acres having been converted from a nursery into a botanic garden about five years previously. The conservatory is not a hot-house, and the species of plants it contains belong to those that require a cool, or at most an intermediate temperature. Like most other botanical gardens that are not supported by the Government, that at Regent's Park has suffered badly for years past owing to lack of sufficient pecuniary means.

IMPERIAL SERVICE ORDER.—Gardeners will be pleased to learn that Mr. WILLIAM BROWNE, late Superintendent Royal Parks, whose portrait we gave on p. 30, has been invested by HIS MAJESTY with the Imperial Service Order. This is the first instance of the kind known to us.

KEW.—In the large herbaceous borders the yellow autumn composites and Dahlias have not as yet put in an appearance; but the old *Lychnis chalcedonica*, with its brilliant scarlet flowers, and *Salvia virgata*, with spikes of lilac-purple flower, are most effective. The white flowers of *Sidalcea candida* and *Chrysanthemum maximum* serve to tone down the brilliancy of the colour. A bed of *Begonia Count Zepphirin* [?], with very deep scarlet semi-double flowers, is noteworthy. *Kniphofia Northii*, with fine glaucous leaves like those of an Agave, but without spines at the margins, and with dense spikes of flowers, greenish-white below, reddish above, is just going out of bloom. The rockwork is so overflowing with interest and beauty that an attempt to note its contents would be futile. A few plants only can be noticed, among them *Dianthus viscidus*, with brilliant rosy-crimson flowers; *Campanula Tommasiniana* is remarkable for its long, tubular or cylindrical corollas, so different in shape from those of most of its allies; *Sidalcea Listeri* is remarkable for its pink flowers with deeply fringed petals; *Meconopsis Wallichii* is a stately plant, whose tawny, hairy surface forms a singular contrast to

the pale blue of the petals; *Potentilla nitida*, with its neat silvery foliage and small white flowers with pink stamens, is charming for covering the surface of rocks; *Halenia elliptica*, a blue-flowered gentian-wort, is a plant for the botanist by reason of its spurred flowers, like those of a *Linaria*, but otherwise so different. Among the Lilies, *L. croceum*, *testaceum*, and *candidum* are the most striking. In the Water-Lily tank near the laboratory are various specimens of Marliac's hybrids, among them *ignea*, *albida*, *Laydekeri*, *lilacea*, *Falconeri*, *flammea*, and others. *Solanum Wendlandi*, at one end of the Succulent-house, is so strikingly beautiful that the wonder is it is not universally grown where conditions are favourable, but as yet it seems little known. It was figured in our columns in 1899. At this time of year we felt inclined to pass No. 4, as there is so much to be seen outside; but let no one make that mistake, as that house is just charming. The contents are far too numerous to be detailed. We can only mention the brilliant *Hidalgoa Wercklei*, sometimes called a climbing *Dahlia*; but that would be no compliment to the graceful *Hidalgoa* unless a single *Dahlia* be intended. The finely-cut foliage and scarlet flower-heads are very beautiful. *Abutilon Golden Fleece* is full of bloom, and its pale yellow flowers drooping from the roof like so many bells are novel and effective. And here we must stop. Kew is much too rich and too varied in its contents to be dealt with in a paragraph. We allude to it with a view of inducing gardeners of all degrees to pay the gardens a visit, and to do so not only at this season, but at any time, for its interest is inexhaustible and independent of season.

— Not the least useful of the publications that emanate from this establishment are the lists of new garden plants published annually, and containing the names of the newly-introduced plants of the year, together with those of others which, having been lost sight of, have lately been re-introduced. The names are arranged alphabetically, with indications of the sources whence they are taken (European horticultural periodicals in general). Short descriptions are given, but generally speaking the names are taken as they are found. It would obviously be impossible to verify any but a very small proportion of them. Garden varieties are not included.

HORTICULTURAL CLUB.—The annual excursion of the members of this Club and their friends took place on Thursday the 16th inst., and despite the somewhat unfavourable state of the weather, was greatly enjoyed. The party, about eighty in number, met at Paddington terminus at 10 A.M., and proceeded in two saloon carriages to Windsor, where, thanks to the management of Mr. HARRY VEITCH, who undertook the arrangements, the courtesy of Mr. NUTT, the architect, Mr. MACKELLAR, the gardener, and Mr. TAIT, the farm steward, the Castle, the grounds, and the collection of cattle were all inspected in turn under the best of auspices. The Club, thanks to special permission accorded by the KING, enjoyed the unusual privilege of visiting the private gardens as well as those more generally open to inspection; and it need hardly be said the members were delighted, not only by the beautiful design of the gardens, but also by the order in which they are kept. On arriving at Windsor some of the party decided to drive through and around the splendid park; the major number, however, deterred by the threatened downpour, elected to visit the interior of the Castle, and although the State Apartments were not available for inspection, a tour through St. George's Chapel, the Memorial Chapel, and other adjuncts of the Castle itself was greatly enhanced by the presence of Mr. NUTT, who very kindly acted as cicerone to the party, pointing out the special points of architectural and historical

interest. To those who drove round the park the beauty of the scene was heightened rather than otherwise by the freshness imparted by the showers, the atmospheric effects on the long vistas of the avenues being charming. At 1 o'clock the party lunched at Messrs. LAYTON'S, and subsequently were conducted over the gardens by Mr. MACKELLAR, passing through the private gardens aforesaid and thence to the dairy, and finally reaching Frogmore. A capital tea had been arranged in one of the Royal conservatories, after which a couple of hours were spent in visiting the kitchen and other gardens, and eventually, under Mr. TAIT'S supervision, the prize cattle were paraded for the visitors' benefit, the party then being driven back to Windsor to dinner at Messrs. LAYTON'S. Mr. HARRY VEITCH presided, and after the toast of "The KING" had been gratefully honoured, the healths of Messrs. NUTT, MACKELLAR, and TAIT (the two latter gentlemen being present) were proposed and drunk with grateful recognition of their kind contributions to the enjoyment of the day, the function closing after a few words from Mr. HUNT, a visitor from New Zealand, with a similarly well-deserved recognition of Mr. HARRY VEITCH'S successful efforts to make it a red-letter day in the annals of the Club.

NATIONAL CHRYSANTHEMUM SOCIETY.—On Monday the 13th, the annual outing of this Society took place, a party of about 190 persons journeying by Great Western Railway to Reading, thence by water to the private landing-stage at Park Place, Henley-on-Thames, Mrs. NOBLE having kindly given permission that a visit might be made to the gardens and grounds. Dinner was served in a shady walk, over which the branches of trees formed an archway; then followed a perambulation of the grounds, after which tea was served, the party making the return by water to Reading, thence to London by train. It was an ideal day for such a visit, and it was greatly enjoyed by all; and Mr. GEO. STANTON, the steward, with Mr. W. T. POWELL, the gardener at Park Place, did all in their power to make the outing pleasant. Previous to embarking, photographs were taken of the group, the result being highly successful.

SUGAR-CANE EXPERIMENTS.—Reviewing the results obtained in Antigua and St. Kitts by Mr. WATTS, Sir DANIEL MORRIS says:—"The objects of the experiments are (1) to find disease-resistant varieties; (2) to discover a cane the equal or perhaps superior of the Bourbon, the cultivation of which has had to be abandoned owing to its susceptibility to fungoid attack. On the results of this year's experiments in Antigua, the Barbados seedling B. 208 heads the list. In St. Kitts the same variety also occupies the first place. In 1900-1, B. 208 was second and first in position in Antigua and St. Kitts respectively. Moreover, it occupied the first position in the Barbados experiments in 1900-01, and again this season. Mr. WATTS is therefore justified in recommending 'this cane with some degree of confidence for cultivation, always remembering that caution is necessary in the introduction of a new variety of cane.' Another variety of cane which stands out prominently is the Demerara seedling D. 95. During the last three years it has occupied a uniformly high position, and is worthy of careful attention at the hands of the Sugar-planters of the Leeward Islands. The caution of Mr. WATTS concerning the possible disappointment which may accrue to planters through their purchasing from distant places canes of the same name as those found to do well in their own locality, is worthy of notice. Planters would do well to exercise care in obtaining their supplies from a stock which has been proved to do well in or near their own districts. The chemical selection experiments are of great interest as indi-

cating a possible method of improving the Sugar contents of certain varieties by selecting only the richest canes for plants. These experiments are, however, not sufficiently advanced to warrant any generalisation being drawn from them."

MALMAISON CARNATIONS.—Each flower nowadays, or each category of flowers, is made the subject of a special literature. The Malmaison Carnation forms no exception to this rule. Under the title *L'Éillet à la Grande Fleur* (Paris, OCTAVE DOIN), M. RUDOLPH discusses the history and cultivation of these large-flowered varieties, and gives a list of those most frequently cultivated in France. The original *Souvenir de la Malmaison* was, it appears, raised in France in 1857 by M. LAINÉ, but a great step forward was made in 1895, when M. PERRIN, a nurseryman near Nice, exhibited a series of varieties at Cannes. In 1899 a number of new varieties were introduced from Bohemia. It is stated that a Bohemian military doctor was taken prisoner at Austerlitz and detained at Lyons; there he was attracted by the beauty of the Carnations he witnessed, and on returning to his native country he took seeds with him, raised new varieties, and by continued selection obtained a very fine race. M. RUDOLPH enumerates at some length the races produced, and the varieties exhibited by various raisers, but he is almost entirely silent as to what has been done on this side of the Channel. To him the Carnation Society is apparently unknown, and the names of MARTIN SMITH and DOUGLAS do not appear in his pages, though a few lines are devoted to the cultivators in the United States.

LATICIFEROUS TUBES IN CONIFERS.—M. CHAUVÉAUD, a pupil of M. VAN TIEGHEM, calls attention, in the *Comptes Rendus* for May 4 of the present year, to the presence of laticiferous tubes, some simple, others branched, in the liber of Conifers, whilst the resinous fluids are poured out of the cells in which they are formed, with intercellular resin-canals; the latex remains within the cells. The laticiferous tubes are specially seen in the young seedling plants.

THE GARDENS OF THE VATICAN.—In the last issue of his weekly journal, Mr. T. P. O'CONNOR has gathered together many interesting details concerning that remarkable man the late Pope Leo XIII. For us, here, the particulars respecting the POPE as a gardener, and the setting forth of the gardens, possess interest. "T. P." says the late Pontiff took a great interest in the Vatican gardens—would watch the growth of flower and fruit and tree with daily solicitude. He was very proud of the fact that the gardens produced 10,000 fine Oranges yearly; and one day he found that the gardener had allowed some of the Ivy to languish. The gardener excused himself on the ground that the soil was bad. The Pope replied, "You don't know what you are talking about, or else you think we believe everything you are pleased to tell us." After which admonition the Pope gave the gardener a regular lecture, which made him exclaim, as soon as the Pontiff's back was turned, "He can teach anyone, from the cardinals to the gardeners. They can't get over him!"

FULHAM PARK EXTENSION.—There was a double commotion at Fulham on Saturday last, a severe thunder-storm—thunder, lightning, and a deluge or two of rain—and the ceremony of opening the fine addition to Fulham Park. The former event brought consternation to the district; the latter brought Lord MONKSWELL and sundry members of the London County Council to the resort of the inhabitants of Fulham, and with all due ceremony and some expedition the ribbon bounding the older portion of the grounds from the new was severed, and the whole declared free for ever to the inhabitants of this one-time

distant suburb. The new portion (some 8½ acres) consists among other things of a fine sheet of water, with two KING'S swans floating on its surface; a fine sand-beach for the small boys of Fulham, whereon, with a little imagination, they can fancy themselves at Southend or Margate; a terraced promenade, a grotto of wildings, &c. When the season has really settled down to its work, the park, flower-beds, and shrubs, &c., will be duly appreciated by those for whom they have been provided.

IMPORTANCE OF SCIENTIFIC KNOWLEDGE.—

The following remarks apply to the gardener as well as to the farmer:—"Better knowledge of animal husbandry, of the physiology of plants, and the chemistry of soils, is most needed by the farmers of the United States as a gift of the year 1903. . . . The farmer who thinks is the farmer that is making the money by his crops to-day. We buy too much in the way of agricultural products from abroad—too much that might just as well be raised by ourselves within the limits of our own territory. This year we shall have purchased \$200,000,000 worth of plant products which we could have grown in the United States, and, in addition, another \$200,000,000 worth that might have been produced in our new tropical possessions. The more our farmers know, the more things they will be able to grow, and the richer we shall be. Half the people of this country live by the soil directly, and 65 per cent. of our exports go from the farmers. If the foregoing be true of the United States farmer, it is even more so of the West Indian planter. We have in previous issues of this journal pointed out the great importance and need of educating the young generation of farmers and planters in the scientific principles underlying agriculture, if we would obtain the best possible results from tillage of the soil. The raising at home of products which are at present imported from abroad in large quantities, is another point the importance of which has often been emphasised in this journal." *The Agricultural News*.

EXPERIMENTS AFFECTING THE LIFE-HISTORY OF THE BRAMBLE.—

M. GASTON BONNIER has contributed to a recent volume of the *Bulletin de la Société Botanique de France*, the results of some experiments made by him with Brambles. The usual life-history of these plants is as follows, so far as their arching branches are concerned. In the first year such stems produce leaves from the axils, of which come shoots, which arch over and become rooted at the tip, which forces itself into the ground. In the second year the shoots develop, and put forth rather short branches curved to about 45° from the horizontal plane, bearing a few leaves and terminating in an inflorescence. In the third year the whole arch dies, and consequently, buds formed on the second year's branches never develop. By fixing these arching stems in an upright position and maintaining them in that position for several years, M. GASTON BONNIER has induced decided modifications in the biology of the Bramble. The nutrition of the stems is influenced by their vertical position, since they can produce roots at one extremity only. Instead of the branches forming roots during the first and dying at the end of the second season, the life of these stems was prolonged for three or four years, while they put forth successively flowering branches the second season, and further, new shoots in the third season, a phenomenon never observed under natural conditions.

"NEWQUAY: THE VALE OF LANHERNE AND PERRANZABULOE." By FANNIE GODDARD. (Published by the Homeland Association for the Encouragement of Touring in Great Britain, St. Bride's Lane, Fleet Street, E.C.) This is No. 27 of the Homeland Handbooks, and is well up to their usual level of excellence. It is meant to

serve as a "sympathetic companion to the cliffs and headlands around Newquay," and should serve this purpose well, as it treats pleasantly of an interesting corner of Cornwall. The natural features and natural history of the place are dealt with, and the various interests that await the intelligent visitor. We are glad to be referred to local directories for information concerning church services and public institutions, and so to have a smaller handbook, more convenient and portable. There are a few blank pages for notes, and a map reduced from the Ordnance Survey map of the neighbourhood, that add value to the publication.

DEPUTATION TO CARDIFF.—The Cardiff and County Horticultural Society's Show took place on Wednesday and Thursday last in the Sophia Gardens, Cardiff. On Wednesday there was a deputation from the Royal Horticultural Society, including Mr. F. G. LLOYD, Rev. W. WILKS, M.A., and Mr. S. T. WRIGHT. We hope to give some details of the exhibition in our next issue.

DESTRUCTION OF PLANTS IN GARDENS IN

ABERDEEN.—Much indignation is being felt in west-end circles in Aberdeen, writes an Aberdeen correspondent, at the destruction caused in gardens by midnight prowlers. These persons have torn up and scattered about almost everything they could lay their hands upon. Their object has not been theft, as the more valuable plants and flowers have been left strewn all over the grounds. The absolute ruin for this season of some of these pretty gardens seems to be entirely malicious. One night recently, in the suburb of Queen's Cross, at least ten different gardens were visited by the scoundrels, and the whole of the beautiful and expensive plants which these gardens contained were torn up, tossed about, and trampled upon. Some idea of the destruction committed may be gained, says our correspondent, when it is stated that at one house at which I called, and which has a very small garden, the owner estimated the damage done at over £5, without taking into consideration the loss of the pleasure he derived from his garden. The loss entailed upon those with large gardens must be exceedingly great. In one case a long length of garden hose was destroyed, and after dragging it all over the ground as an implement of destruction, they left it lying in a side street. As may be supposed, elaborate precautions have been taken by the police authorities—precautions, it is sincerely to be hoped, that will lead to the capture of the delinquents.

KITCHEN-GARDEN PESTS.—The number of the *Profitable Farm and Garden* for July 11 contains a coloured plate representing the Asparagus-beetle, the Carrot-fly, the Celery-fly, and the Onion-fly.

NEW BORDER CARNATION.—Mr. G. F. BROTHERSTON, of Breckenborough Hall Gardens, Thirsk, sends for our inspection blooms of a seedling Carnation of a somewhat unusual shade of colour. The flower is of good form and substance, and of a rich orange-salmon colour. The calyx does not split. Altogether we think highly of this Carnation, to which, under the name "Francis Samuelson," a First-class Certificate was awarded at the York Gala on June 24. (See also p. 56.)

PRESIDENT ROOSEVELT AT HOME.—The *Pacific Florist* for July has a portrait of the President of the United States, with axe on shoulder, on his way to fell a tree, Gladstone-wise, at his summer residence, Oyster Bay, New York.

"THE WILD GARDEN."—The thing is so full of interest and beauty that we are not disposed to cavil at the name, in spite of its inappropriateness. To many, indeed, if not always to the professional

gardener, it has charms which no garden in the proper acceptation of the term could rival. It is the place for the plant-lover and the botanist to revel in. For these reasons we welcome the publication of the fifth edition of Mr. ROBINSON'S book under the above title, published by JOHN MURRAY. It contains abundance of useful hints for the utilisation of hardy plants, native as well as exotic, numerous pretty wood-cuts, and a copious index.

JOHN EVELYN CLUB.—With this very appropriate title for a Surrey society, and under the presidency of Mr. T. G. JACKSON, R.A., with Messrs. CLARENCE MORAN and RICHARDSON EVANS as honorary secretaries, a club has been established at Wimbledon to unite all residents who value grace, dignity, and interest in the aspect of their surroundings (1) in protecting from unnecessary impairment the picturesque amenities of the neighbourhood; (2) in promoting the study of its historical associations, zoology, and botany; (3) in preserving the fauna and flora, as well as objects of historical and archaeological interest. The club will act locally so as to advance the objects of such societies as the Commons and Footpaths Preservation Society, the Kyrle Society, the Selborne Society, the Birds' Protection Society, the National Trust, &c. We wish it every success. *Nature Notes*, July.

LATE STRAWBERRIES.—Prolongation of the season, flavour, free cropping, hardihood, freedom from disease, and substance, so as to endure transport, these are among the requirements which the raiser of new Strawberries pays heed to. Some of these points are of special consequence to the grower for market, but none of them is a matter of indifference to the grower of Strawberries for whatever purpose. We were reminded of these matters by the receipt from Messrs. BUNYARD & Co. of a collection of late fruits grown in the open field. Strawberries are not particularly well adapted for railway transit, and these particular samples did not reach us in first-class condition, but we were enabled nevertheless to form some opinion of their merits. Among them were:—

Givons Late Prolific, a new kind, of great value as being late, of good size and flavour. It is a handsome, wedge-shaped or sometimes cock's-comb-shaped fruit, often lobed, of a rich colour, juicy, and of good flavour. As the plants are still bearing flower, its merits as a late variety are incontestable.

Louis Gautier is a very prolific variety, with large, wedge-shaped fruit, whitish, very juicy, and of good flavour.

Queen of Denmark is a late variety, with fruits of moderate size, and flavour of the Alpine section.

Frogmore Late Pine, a deliciously-flavoured variety, of large size and a very dark colour.

Filbert Pine, a prolific variety, late, and of medium-size and flavour, conical in shape.

DR. ABEL, Director of the Imperial and Royal Horticultural Society in Vienna, died at Mönchkirchen on June 28.

A GENEROUS LANDOWNER.—We are glad to hear that LEOPOLD DE ROTHSCHILD, Esq., of Gunnersbury House, Acton, has just remitted fifteen per cent. of the half-year's rent to the market gardeners upon his Gunnersbury estate, on account of the extraordinary loss they sustained by the destruction of the fruit crops by late frosts. It is a happy instance of a landlord voluntarily sharing the misfortunes of his tenants.

CROYDON AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—"Tomatos" was the subject of a paper given before the members of this Society, at their rooms, Sunflower Temperance Hotel, George Street, recently; and the mode of culture recommended by

Mr. F. OXTOBY, Coombe Lodge Gardens, found hearty appreciation from all present. Mr. A. MASLEN will give the next paper, "Summer Pruning," on August 18.

ROYAL APPOINTMENT.—Messrs. THOMAS METHVEN & SONS, of 15, Princes Street and Warriston Nurseries, Edinburgh, have been appointed nursery and seedsmen to His Majesty the KING. The firm formerly held a Warrant from her late Majesty Queen VICTORIA.

THE GARDENERS' DINNER.—All those gardeners and others who purpose attending the Gardeners' Dinner at the Holborn Restaurant on September 29 will be interested to learn that the famous rosarian and amateur gardener, Dean REYNOLDS HOLE, of Rochester, has not only secured a ticket, but trusts that all being well he will be present. The Dean is a devoted lover of a garden, and he has only warm feeling for those who make and tend them. Many a gardener isolated from society in some remote spot has heard and read of the Dean, but may have never seen him. It is sincerely to be hoped that not only will he be present to support Mr. LEOPOLD DE ROTHSCHILD, but that hundreds of gardeners will be there to give both a hearty welcome. The chance to attend such a function offers only once perhaps in a lifetime. Already some 200 tickets have been sent out.

A MOTOR LAWN-MOWER.

So far as can be seen at present the motor is destined to become as common in our roadways as horse-drawn vehicles have been, and there appears no reason why it should not be employed also for cutting grass in gardens where there are extensive lawns. We have previously illustrated a lawn-mower provided with an electric battery for propelling purposes, also a lawn-mower driven by steam (see *Gardeners' Chronicle*, March 28, 1896, p. 401), and in fig. 24 is shown a petrol-driven machine manufactured by Messrs. Ransomes, Sims & Jefferies, Ltd., Orwell Work, Ipswich, who are amongst the first to anticipate a demand for an improved type of machine.

Amongst the advantages possessed by this machine are the following. There is no delay in starting, as in the case of a steam-motor, but it can commence work in five minutes. There are no coils or electric batteries employed for ignition, and no hoof-marks are left on the turf. One man can manage the motor lawn-mower with ease; and, riding on the motor, he can get over much more work during the day than when using a horse-power machine and walking behind it; and there is no need for the boy usually employed to lead the horse. The machine can be stopped or its direction turned without difficulty. There are smaller motor machines which are not provided with a seat for the driver.

attention to the fact that wherever moles have been the grass grows afterwards very luxuriantly. Miss Ormerod and Sir Herbert Maxwell have also written to the same effect. The Board of Agriculture publishes a leaflet on the habits and life-history of the cockchafer, in which it is stated: "Moles and shrew-mice feed upon cockchafers, and both of these animals should be protected." Moles, instead of being the farmer's foes, are really his friends; and we may yet see laws passed to save him from extermination at the hands of his senseless persecutors. "Certain it is that in the present depressed condition of agriculture" (to quote from an article in the *Nineteenth Century* by the Rev. Augustus Jessop), "it is difficult to estimate how much serious mischief is being done by the extermination of one of the farmer's best and most influential friends, the mole." *Joseph Collinson, 53, Chancery Lane, W.C.*

SWEET PEAS.—I was interested to find that the experience of J. J. Cole (p. 3) with Sweet Peas was similar to my own. I was one of the fortunates who last year obtained a white Pea from a packet of "Miss Willmott," bought from the firm of Eckford, and I cannot believe it was the result of accidental mixing of two varieties, but was a sport or reversion from "Miss Willmott." I saved seeds from this, but did not notice whether the seeds were of different colours. All the seeds were sown and carefully cultivated, and all have now without exception pure white flowers—in size, shape, and habit of growth the counterpart of "Miss Willmott." However, all

must first be deprived of its stamens before foreign pollen can have a chance to operate, but this being done cross-fertilisation is possible, though perhaps not easy. *John T. Blencowe, "Eastcott" Gardens, Kingston Hill.*

The communication from Mr. J. J. Cole re Sweet Peas in your issue of July 4, is a most interesting one. He has now arrived at the opinion that Mr. John Green and I once held regarding the origin of "Dorothy Eckford." The following statement may be interesting to those interested in Sweet Peas:—The first year "Miss Willmott" was sent out, Mr. Robert Sydenham told me to be on the look-out, as there was either a pure white mixture or a sport in that variety. My firm grew a number of plants at Rothsay, and among them one carried white flowers; but it was not possible to save seed on account of the wet summer. At Orpington an equal number was grown, but no trace of white flowers appeared there. The following season my firm had at Orpington a number of white-flowered forms in a long line of "Miss Willmott" (grown from seed saved by themselves), and was able to exhibit it at Wolverhampton under the name of "White Queen," where it obtained a certificate. Mr. Green also exhibited the same form under the name of "White Wings" in the Eastern Counties, and also obtained a certificate for it. When the matter came before the National Sweet Pea Committee at the time referred to by Mr. Cole, these facts were in the minds of the members. I made a statement at that meeting that in my opinion the variety was a sport, and Mr. Green confirmed this view. It was represented by a member (Mr. Simpson, I think) that it had been raised or selected a year or two previously by Mr. Eckford, and the seed of it and "Miss Willmott" had got inadvertently mixed. Ultimately, after a lengthened discussion, it was agreed to refer the matter to Mr. Eckford, and the Secretary was instructed to ask him for a declaration on the subject; and the decision of the committee was that if Mr. Eckford declared that he had had a stock of the two varieties, and that they had been accidentally mixed, he should have the credit of the variety, and it should officially bear the name of "Dorothy Eckford." None of us desired to rob Mr. Eckford either of the profit or of the credit of the transaction. Mr. Eckford made the declaration, and the matter was settled. Mr. Cole is therefore not quite correct in saying that "the decision of the National Sweet Pea committee was that it was the result of an accidental mixing of the seeds of a new white variety with that of 'Miss Willmott.'" It was not the decision of the National Sweet Pea committee *de facto*; it was the decision of Mr. Eckford. The scientific interest of Mr. Cole's communication is very great indeed, and I hope to have something to say on the question of [seed] sports later in the season. *William Cuthbertson, of Messrs. Dobbie & Co., Rothsay.* [Has any one seen a true sport or bud variation in the Sweet Pea or any other annual? Ed.]

FIG. 24.—A MOTOR LAWN-MOWER.

these points are not proof of its relationship. That proof is to be found in the fact that in a clump of "Miss Willmott" I have again a white flower identical with last year's novelty. In saving seeds I avoided all chance of mixing varieties, so I am persuaded that reversion to an earlier parent is the explanation of its appearance. In spite of careful selection "rogues" are always to be found, and I notice that these "rogues" are generally of a purple-maroon colour, or shades between that and the blue of "Captain of the Blues." This year the variety "Emily Henderson" has amongst it about 20 per cent. of the old "Apple Blossom," a variety I have not grown for five years. This seems to me to be proof that the two varieties have a common ancestry. The cross-fertilising of "Emily Henderson" would not account for "Apple Blossom," for I believe the latter is a much older variety than the white. If the "rogues" were the result of cross-fertilisation one would expect that the colours would be progressive, but I have not met with a "rogue" of a new shade, they are always similar to very old varieties. Many writers say that natural cross-fertilisation is impossible, because insects are unable to force their way to the stigma. This is an error. When a bee alights on a flower its hind-legs work up and down until the keel of the flower is pressed down from the stigma, and the bee collects pollen from the exposed stamens. That the flower is not cross-fertilised is certainly not the fault of the bee. The reason is without doubt the greater potency of its own pollen to effect fertilisation, compared with that from a foreign flower. In fact it is a case where the law of cross-fertilisation does not always hold. It follows then that for a flower to become cross-fertilised it

MELON AND CUCUMBER LEAF-SPOT.—Mr. Stephen Castle, writing in last week's issue of the *Gardeners' Chronicle* (p. 34), says, "This new plague of the gardener, for which apparently no remedy can be found, starts usually in damp or dull weather, and at the end of the house nearest to the door," adding, "that with sunshine it spreads very rapidly." As the statement appears to be somewhat inconsistent with the apparent cause and effect, I am sure that many growers, including myself, would be glad to learn from Mr. Castle how it is that the "spot," if caused through the implied influence of damp or dull weather, comes to spread "very rapidly" under the beneficial influence of sunshine. Mr. Castle also asserts in the last paragraph of his interesting note that "if Cucumbers could be grown on the old lines we should hear nothing of the 'spot,'" adding that "the grower must needs take two crops in a limited period of time, and that his (the grower's) methods account to his thinking the why and wherefore of the prevalence of the disease." Will Mr. Castle kindly explain for the benefit of growers of Cucumbers for market the manner in which Cucumbers were grown on the "old lines," also the method of procedure followed by the

HOME CORRESPONDENCE.

A PLEA FOR THE MOLE.—A writer in a recent issue of the *Daily News* says that "farmers owning much pasture land do not speak highly of the mole." That is quite true; there is a venerable and obstinate prejudice to overcome; but facts are facts, and text-books and works of reference clearly prove that the mole is not a destructive animal. M. Flourens states that the mole, if not exclusively, is essentially carnivorous, and probably the most voracious eater in the animal kingdom. He feeds on worms, snails, slugs, caterpillars, cockchafer grubs, and many other subterranean and surface creatures. Mr. E. A. Sterndale, F.Z.S., in his work on the *Mammalia of India*, says that moles are not trapped in India, and that their destruction in this country is carried on in a spirit of ignorance. Macgillivray, an observant naturalist, regarded the mole as a useful animal. I think it was Frank Buckland who called

growers of to-day, and at the same time give his reason for saying that the *modus operandi* pursued "accounts to his thinking the why and wherefore of the prevalence of the disease," as the bare assertion of facts or of assumed facts is of no practical use to readers unless reasons are adduced showing cause and effect, and suggesting a remedy? Bare assertions are insufficient to convey information to those desirous to learn the why and wherefore of any undesirable symptoms on their plants, &c. H. W. W.

OUT-OF-DOORS PLANTS INJURED VARIOUSLY.

—The specimens we are enclosing herewith we have had forwarded to us from a correspondent resident in Herts. He has sent them for opinion and determination of the causes from which they appear to be suffering, principally a wrinkling and browning of the foliage. He informs us that the gardeners in his locality term it the crimping-and-browning disease. It first made its appearance in 1899, and was then confined to a few things; but now it has spread to almost every plant inside and out, making it, we understand, an impossibility to grow any plants. Even the weeds suffer from the same cause. It appears to us to be a somewhat singular case, seeing that the damage is spread over trees, shrubs, and indoor plants alike, and we should be happy if you could give us your opinion upon the matter as to what is the cause or causes of this so-called disease. Also if you can determine its nature. Are there any remedial measures that could be applied to prevent its further spread? If you would kindly oblige us through your correspondence columns we should esteem it a favour. We have kept a duplicate of each number. C. S. [We append a reply from our authority on plant diseases to the various questions asked in the above communication. Ed.]—
"It is not one particular disease affecting all the plants sent, but several, quite distinct in their nature and origin. 1. Plane-leaf scorch, caused by *Gloeosporium nervisequum*; collect and burn the leaves as they fall, and next spring spray with dilute Bordeaux-mixture when the leaves are expanding. 3. Caused by an aphid or "green-fly"; spray with an insecticide. 6. Foliage injured by late frosts. 7. Injured by "green-fly"; spray with insecticide. 8. Attacked by the fungus called *Botrytis vulgaris*; spray with potassium sulphide solution—1 oz. in 2 gallons of water. 9. Foliage injured by frost. The remainder are undeterminable from the material sent. G. M."

THE ROYAL HORTICULTURAL SOCIETY'S COMMITTEES' CRICKET-MATCH.—This event, in which members of the Floral and of the Fruit Committees contended with each other for fun and fame on the bloodless cricket-ground at Gunnersbury Park last summer, the Fruit men proving the winners, is this year to have its replica on Saturday, August 8 next, the place of the contest being the ground at Holland House, Kensington, with the Earl of Ilchester's kind sanction. Messrs. W. Howe for the Floral team and the challengers, and that fine fruit-grower, Mr. G. Woodward, for the other team, will be the valiant and respective captains. The wickets are to be pitched at 11 A.M., luncheon at 1 P.M. Every member of either Committee is invited to play, and should do so. Members of all the Committees are invited to come with friends and see fair-play, as well as enjoy it. All communications should be addressed to Mr. T. Humphreys, Royal Horticultural Gardens, Chiswick. W.

SAXIFRAGA OPPOSITIFOLIA EATEN BY BIRDS.

—It is said that a favourite food of some of the sandpipers and suchlike birds which breed in the Arctic regions is the leaf-buds of *Saxifraga oppositifolia*. This evening I found what was apparently a homing pigeon, very tame, and seeming to be tired, in one of my Alpine frames, feeding upon the leaves of that plant, and apparently so well satisfied with his fare as to refuse coarse oatmeal which I offered, but continuing to pick the Saxifrage. Has any reader of the *Gardeners' Chronicle* observed that any birds are partial to this green food? If the wood-pigeons and stock-doves which abound round my garden find out that it is good, I am afraid there will not be much of it left by the end of winter. C. W. Dod, Edge Hall, Malpas.

BEGONIA CORALLINA.—This species of Begonia is not nearly so well known as it deserves to be on account of its free-flowering property. At Roundhay Park, Leeds, it has formed the chief centre of attraction during the past few weeks. The plant is trained on either side of the roof of a span-roof plant stove, a position which shows off its blossoms admirably. On the occasion of the visit I paid to the park on the 19th inst. this plant was in full bloom. The plants are planted in boxes filled with turfy loam, peat, leaf-soil, and a small quantity of decayed manure, and a sprinkling of rough sandstone. Many of the present season's shoots measure 3 feet in length. J. F. Donoghue.

POA ANNUA.—Fair comment on one's sayings is a point I admire, but is it honest criticism to take a few words from a paragraph and play upon them as representing the full context of another's arguments? Mr. Castle handles me very uncharitably on p. 43, yet, notwithstanding his desire to act as a tutor, I prefer to stand by the statements on p. 26, save the word "from," which the printer changed from "in." When referring to the seeds of *Poa annua* I wrote as a commercial man, and intended to convey that this grass was not obtainable as a seedman's commodity; and this I still adhere to in face of the paragraph appearing on p. 41. I also feel that I have as much right to call *Poa pratensis*, Kentucky Blue Grass, as Mr. Castle would have in describing Wellington Apple as Dumelow's Seedling. But all this is beside the question that grass seeds are being sold as *Poa annua* which are not true to name or description. Donald McDonald.

THE STRAWBERRY-GRAPE.—At the Drill Hall on Tuesday last I exhibited six fine bunches of Strawberry-Grapes. They had not been at all thinned, and in spite of that the berries were of a respectable size. Had they been thinned by an expert the berries would have been much larger, and probably comparable with those of Black Hamburgh. It seems a pity that this richly-flavoured Grape should not be more grown by amateurs, if not for market. In the autumn I shall be able to supply cuttings of this choice Grape, and perhaps some rooted plants also. Should anyone care to try it, I shall be glad to send some to him or her. It is prolific, and sets extremely well. At all events, for home consumption, it would be an acquisition. There is an extraordinary Grape with berries upwards of 1½ inch long. It is called "Cornichon," of two varieties, white and purple, of which a picture appeared in the *Bulletins d'Arboriculture*, &c., published in Ghent. If experiments were made to cross this with the Strawberry Grape something still more extraordinary and choice varieties might be the result. It is almost hopeless to expect professional horticulturists to undertake such experiments. They grow things for profit, and therefore cannot afford the time and glass-room for experiments that may or may not succeed. This branch of scientific horticulture is essentially the function of [Chiswick and of] wealthy amateurs who have extensive grounds and houses and an expert establishment. The seedlings, after all, would not require very much space to test their values, for grown on the single cane system, a large number could be accommodated in one long house. Then there would be the additional satisfaction of giving to the world a new and valuable Grape, should any of the crossed seedlings turn out an acquisition. Do wealthy amateurs do as much as they could do for the progress of Horticulture? They have wealth and accommodation, and probably ignore their function in the higher branches of horticulture—that is, the creation of new fruits and other things. E. Bonavia, M.D., July 22, 1903.

CARNATIONS AT LEIGHTON HOUSE, WEST-BURY.—A successful cultivator of the Carnation in this neighbourhood is Mr. Geo. Bound, head gardener at Leighton, whose display for several years past of Tree, Souvenir de la Malmaison, and border varieties in their respective seasons has been unusually good. One division in a range of glass is devoted almost exclusively to Carnations in pots, the health of which and the vigorous spikes and large, deeply-coloured blooms betoken careful cultivation. Fungous diseases, which cause so much havoc among Malmaisons

in many gardens, is scarcely remarked here, a weekly spraying of Condy's fluid in a diluted state keeping down this pest so successfully that but little injury is done. The robust health of the plants also tends to ward off attacks, and if a case should occur the plant receives immediate attention. The house, a three-quarter-span, is well ventilated, and is fitted with roller-blinds, which are employed in sunny weather. Though some of the newer introductions are included in the collection, the old Blush still remains the favourite variety. The deeper-coloured Rose Malmaison is also a conspicuous variety in its season of blossom. Iolanthe, Lady Ulrica, Lord Welby, Mrs. Torrens, Princess May, Churchwarden, Sir Evelyn Wood, and Lady Grimston are a few I noted as giving bold and bright blooms. Tree varieties, viz., Uria Pike and Bendigo, are much grown for cutting and as pot plants for conservatory decoration. Many named border varieties, like the potted stock of Carnations, are successfully treated. Here, as in many other places, complaint is rife about the injury due to the inclement weather, the excessive rain and cold winds being more destructive than actual frost. W. S.

ALYSSUM SPINOSUM.—Those who have not been so successful as Mr. S. Marshall Bulley in cultivating *Alyssum spinosum* would be pleased to read his note on the plant in the *Gardeners' Chronicle* of July 18, and to see the photograph reproduced on p. 42, which shows such a fine plant. It is pleasant to see that a plant with which a good many of us have not been so successful as we would desire is doing so well at Haslemere. One can only speak of plants as one has found them and as others have recorded, so that such notes as those of Mr. Bulley are exceedingly valuable. S. Arnott.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 21.—The usual fortnightly meeting of the Committees on Tuesday last was not the only attraction at the Drill Hall on that day. There was an unusually fine exhibition of Carnations, under the auspices of the National Carnation and Picotee Society. The date happened to be a suitable one to catch the flowers in fine condition, and they appeared at their best. A detailed report is given on p. 65.

The Royal Horticultural Society's Show was necessarily smaller than usual, there being less space available.

The ORCHID COMMITTEE recommended a First-class Certificate, a Botanical Certificate, and an Award of Merit to novelties, and only one Medal for a group of plants.

The FLORAL COMMITTEE recommended one First-class Certificate and five Awards of Merit to novelties, and nearly a dozen Medals for groups of plants, including Carnations.

The FRUIT AND VEGETABLE COMMITTEE recommended a First-class Certificate to the Loganberry.

In the afternoon a considerable number of new Fellows was elected; and a LECTURE was given by Mr. HUNT upon "Horticulture in New Zealand."

Floral Committee.

Present: H. B. May, Esq., in the chair; and Messrs. C. T. Drury, John Green, J. F. McLeod, W. Howe, C. R. Fielder, Chas. Dixon, W. Bain, C. J. Salter, H. J. Cutbush, R. W. Wallace, Chas. E. Pearson, H. J. Jones, Charles E. Shea, W. P. Thomson, E. H. Jenkins, Geo. Paul, W. J. James, A. Perry, Chas. Jeffries, E. T. Cook, J. Fraser, Jno. Jennings, R. Dean, James Hudson, and H. Turner.

The Chairman, speaking on behalf of the members of the Committee, expressed regret that the Committee will shortly lose the services of the Secretary, Mr. Thomas Humphreys, who has acted as such for the past eight years, and wished him every success in his future sphere of work as Curator of the Birmingham Botanic Gardens.

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, N., exhibited a collection of cut Roses, in about forty varieties, large bunches of each being arranged in vases. Some of the most attractive were Mrs. W. J. Grant, shown as Belle Siebrecht; Madame Ravary, a salmon-coloured H.T.; Louis van Houtte, the intense crimson-coloured H.P.; Gruss an Heppitz, rich velvety

crimson H.T.; Frau Karl Druschki, the new white H.P.; Duke of Edinburgh, Royal Scarlet, Horace Vernet, &c. (Silver Banksian Medal).

Messrs. W. PAUL & SON, Waltham Cross Nurseries, Herts, exhibited a large collection of decorative Roses. Excellent growths and flowers of the new H.P. Frau Karl Druschki were conspicuous among the many varieties shown, and a new Tea Rose named Earl of Warwick was shown, the flowers being of large size and a salmon shade of pink in colour. One of the brightest coloured bunches was one of the Tea Rose Souvenir de J. B. Guillet, rosy-scarlet (Silver Banksian Medal).

An excellent exhibit of Water-Lily flowers was made by LAWRENCE CURRIE, Esq., Minley Manor, Farnborough, Hants. They were all varieties of *Nymphaea*, and were arranged in large earthenware pans of

chester, had an exhibit remarkable for its splendid seedling varieties of *Iris Kämpferi*, which varied in colour from pure white to intensely deep purple. These were only distinguished by numbers at present. Lilies included *L. longiflorum giganteum*, the yellow *L. Szwevitzianum*, *L. elegans*, the elegant and pretty *L. Krameri* (of palest pink colour), *L. excelsum*, *L. Martagon dalmaticum* (intense purple colour), *L. auratum*, &c. *Calochortus clavatus* is a very large fine yellow species. *Gladiolus Colvillei* varieties, Pentstemon "Newbury Gem," perennial Phlox "Fiancée" (white), &c., were also noticed in this exhibit (Silver Banksian Medal).

A collection of upwards of thirty varieties of Sweet Peas was shown Lady PLOWDEN, Aston Rowant House, Wallingford (gr., Mr. Black).

yet seen of the new *Passiflora maculifolia*, which was figured in a Supplement to the *Gardeners' Chronicle*, November 8, 1902. The three-lobed, truncate leaves were larger, and the yellow and purple variegation more highly developed. It is remarkable that the Floral Committee should have passed such a decorative new species.

An excellent strain of Sweet Williams was shown by Messrs. DOBBIE & Co., Rothesay, as their "Auricula-eyed" strain. The flowers were good, and the colour pure and brilliant. The Committee awarded a Cultural Commendation.

Messrs. JAS. VEITCH & Sons, Ltd., Chelsea, S.W., showed a floor group of warm-house *Rhododendrons* (*Javanicum* and *Jasminiflorum*) in variety, the plants having a height of 2 to 4 feet, and being generally

FIG. 25.—*NYMPHAEA GIGANTEA*: COLOUR PALE BLUE; HALF NATURAL SIZE.

water, containing *Nymphaea* foliage in a similar manner to that Mr. HUDSON has adopted for some years past. There were twenty-four pans, and in some of these as many as ten open flowers were shown. The most showy of those shown were *Nymphaea Marliacea albida*, *N. m. carnea*, *N. m. rosea*, *N. alba candidissima*, *N. Laydekeri rosea*, *N. Ellisiana* (rich red colour), *N. odorata sulphurea*, and *N. Marliacea chromatella*, both pale yellow-coloured flowers, &c. The flowers were unusually large and strong (Silver Flora Medal and Cultural Commendation).

Messrs. WM. BULL & SON, 536, King's Road, Chelsea, exhibited a number of varieties of *Fuchsia*, the plants being in 5-inch and 6-inch pots. Some of the most attractive were *Prince of Orange*, *Nautilus*, *Burel*, *Lena*, *Muriel*, and *Valliant*.

Messrs. R. WALLACE & Co., Kilnfield Gardens, Col-

Mr. H. B. MAY'S exhibit of Ferns from the Upper Edmonton Nurseries on this occasion was a collection of species and varieties of *Gymnogrammas*, thirty-six distinct forms being included. Prominence was given to beautiful specimens of *G. schizophylla gloriosa* and *G. s. g. superba*. The much-crested, heavily-powdered forms included *G. chrysophylla ramosa* and *G. grandiceps superba*, both gold coloured; *G. peruviana cristata* and *G. p. argyrophylla* are equally powdered with silver colour. A striking difference from these types was shown in *G. japonica variegata*, this species having a superficial appearance akin to that of a *Pteris*. Altogether, the exhibit was full of interest to those who admire Ferns, and it included the rare *G. Muelleri* (Silver Banksian Medal).

Sir TREVOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. Bain), exhibited the best cultivated plant we have

well furnished with flower trusses. We noted *Princess Beatrice*, pinkish fawn, a fine large truss; *R. multi-color Latona*, flowers canary-yellow, a neat truss; *Lord Wolseley*, possessing a telling truss, well furnished with orange red coloured blooms; *Ophelia*, of light rose, with a yellowish shade; *Indian Chief*, an orange-coloured flower; *Ne Plus Ultra*, flowers of brilliant scarlet, one of the most vivid coloured varieties; *Princess Alexandra*, still one of the most beautiful, white with a pink tint; *Amabile*, flowers light pink and of large size; *Javanicum*, one of the parents of this breed; *Imogene*, flowers of a pale priurose tint; *luteo roseum*, soft rose; and *Monarch*, of a deep orange tint. The firm likewise arranged a floor group of hardy herbaceous perennials as cut flowers, set up in big bunches in vessels of water. There were the bright yellow *Heimerocallis Thunbergi*, *Centaura*

ruthenica, Achillea eupatoria, having massive flat corymbs of yellow flowers; Galega officinalis albiflora, Chrysanthemum maximum var. Triumph, showing some doubling of the florets; Achillea Millefolium rubrum, Dracocephalum virginicum album, Centaurea glastifolia, having yellow flower-heads; Campanula alliariaefolia, a species with long spikes of white flowers; the double-flowered var. of Hemerocallis disticha, Rudbeckia californica, Cimicifuga racemosa, some very fine strong specimens of Lychnis chalcidonica, Pentstemon, Everlasting Peas, Eootheras, Phloxes, Geraniums, Veronicas, &c.; also a collection of Sweet Peas (Silver-gilt Flora Medal).

Messrs. H. CANNELL & SONS, Swanley, Kent, showed a quantity of tuberous-rooted Begonia in double forms of flower, and single flowered bedding varieties of varied shades of crimson, pink, and blush, the latter grouped under the name Eureka. Amongst the first named we remarked Gen. Baden-Powell, deep crimson, of a beautiful form, double; Lord Milner, also double-flowered, of a rich magenta; King Humbert, a scarlet flower that often comes with several centres; Lord Stradbroke, similar in form of flower and colour to Gen. Baden-Powell; Lady Mary Leyland, a fringed flower, nicely double, and of a cherry-red colour; Mrs. Thompson, pale yellow, very distinct.

Messrs. BARR & SONS, King Street, Covent Garden, set up a stand that included among its attractions a piece of Japanese rockwork consisting of cement, and furnished with pigmy trees and Azaleas in flower. The other exhibits consisted of hardy herbaceous perennials, such as Liliums, Eootheras, Achilleas, Iris Kämpferi in variety, Dianthus Napoleon III, having bright-crimson flowers; a good many varieties of Phlox, Helianthus, Lychnis chalcidonica, Campanulas, Shirley Poppies, a few Water-Lilies in pans of water, Androsace coronopifolia Brodiaeas, &c.

Mr. AMOS PERRY, Hardy Plant Farm, Winchmore Hill, showed Water-Lilies Laydekeri, Marliacea varieties, the fine rich coloured Nymphaea Ellisiana, N. Seignoureti, rich pink; N. chromatella, Robinsoni, Gladstoniana, white, with vivid yellow central petals; N. gloriosa, deep crimson; N. Brakleyi, and several others. Other subjects shown consisted of Geum Heldreichi, Lilies of species, Campanulas, varieties of C. lactiflora and the type species (Silver Banksian Medal).

Awards.

Asparagus plumosus cristatus.—This is a crested variety of the best-known decorative Asparagus. The growths terminate before they are much more than 12 inches high in a great crest like that possessed by varieties of Pteris Fern. It is not likely to be so attractive or useful as the type. Shown by Sir TREVOR LAWRENCE (Award of Merit).

Begonia Marie Bouchell is a variety of Begonia with bright-red double flowers. It partakes of the B. boliviana type in regard to the arrangement of the stamens, and in this case all the stamens having become petals the flower appears like a bright rosette over two large ordinary petals. Amongst Begonias it may take a place as a decorative flower similar to that of the Japanese flowers in the Chrysanthemum. A large plant covered with blossoms was shown in a basket, for which form of cultivation it is specially suitable, the growths being of a straggling character 3 to 4 feet long. Shown by W. GREENWELL, Esq., Mardon Park, Wodingham (gr., Mr. W. Lintott), (Award of Merit).

Lilium elegans, Peter Barr.—An excellent variety of this popular Lily, colour orange-yellow with very few spots, as described on p. 41 of our last issue. The flowers are very large, and the petals broad, recurving a little at the tips. Shown by Messrs. BARR & SONS (Award of Merit).

Nephrolepis Fosteri.—An American variety of N. exaltata, producing fronds 3 feet long and nearly 8 inches across. After making the ordinary pinnae, there occurs proliferation, each of the pinnae producing small fronds, again bearing normal pinnae. The variety is said to reproduce itself truly from spores. Shown by Messrs. J. HILL & SON, Lower Edmonton (Award of Merit).

Nymphaea gigantea var. Hudsoni.—This is a seedling variety of the handsome blue Nymphaea illustrated on p. 63, fig. 25. It was raised by Mr. J. Hudson in the garden of Leopold de Rothschild, Esq., Gunnersbury House, Acton, W., and has larger flowers than those of the type and deeper in colour. The petals are of greater breadth and are more reflexed. Whilst the flowers of the type are described as lying upon the surface of the water, those of this variety, being borne upon stouter stems, stand erect above the water.

Shown by LEOPOLD DE ROTHSCHILD, Esq. (gr., Mr. Hudson), (First-class Certificate).

Pteris metallica.—This is a strong-growing Pteris with thick, metallic-looking fronds about 14 inches high, the pinnae being 3 to 4 inches long and an inch across, similar in habit to P. cretica major. Shown by Mr. H. B. MAY (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas O'Brien (Hon. Sec.), De B. Crawshaw, W. Cobb, J. Douglas, H. T. Pitt, T. W. Bond, W. H. Young, W. Boxall, J. W. Potter, H. Little, H. Ballantine, W. H. Pollett, and M. Gleeson.

There was a small but select show of Orchids.

The only group was a very showy one staged by Messrs. SANDER & SONS, St. Albans, and for which a Silver Flora Medal was awarded. The chief feature in the collection was a fine series of varieties of Lælio-Cattleya × Bletchleyensis (L. tenebrosa × C. Warscewiczii), and which ranged from the light rose-purple petalled typical form through various shades of bronzy-rose with purple lip, and culminating in the gorgeous L.-C. × bletchleyensis "Illuminator," which is one of the finest and most richly coloured of the hybrid Lælio-Cattleyas (see Awards). There were also shown varieties of Lælio-Cattleya × Martinelli, all beautiful, but showing great variation in colour. Two plants of the white and rose-coloured Pachystoma Thompsoni, Cattleya Mossiae celestis, like C. M. Reinckiana, but with bluish markings on the lip; the new Lælia × crispa-brosa (crispa × tenebrosa), with light lilac-tinted flowers veined with claret tint on the lip; Cypripedium × barbato-Rothschildianum; the curious and elegant Eranthes grandiflorus, and other species.

Messrs. HUGH LOW & Co., Bush Hill Park, showed a good Cattleya Mossiae Wageneri, a pretty blush-white form of C. Mendellii, C. Harrisoniana alba, and Lælia majalis.

Messrs. T. ROCHFORD & Co. showed Cattleya Mendellii King Edward VII., a white variety with chrome-yellow disc to the lip; and a white form of C. labiata Gaskelliana, with a small rose blotch on the labellum.

J. GURNEY FOWLER, Esq., Glebe-lands, South Woodford (gr., Mr. J. Davis), sent a fine cut inflorescence of Eulophiella Peetersiana which had borne twenty flowers, and now had thirteen. Also a beautiful branched spike of Renanthera Storiei with rich red flowers, the large lateral sepals of which were blotched with crimson.

MALCOLM S. COOKE, Esq., Tankerville, Kingston Hill (gr., Mr. Buckell), showed a form of Odontoglossum crispum with lilac-tinted flowers bearing a few brown spots.

Awards.

FIRST-CLASS CERTIFICATE.

Lælio-Cattleya × Bletchleyensis, Illuminator (L. tenebrosa × C. Warscewiczii), from Messrs. SANDER & SONS.—Perhaps the finest in colour of any of its section. Sepals and petals orange-salmon with a purple glow extending from the small whitish base of each segment. Lip entirely of a dark velvety-purple colour, with a maroon veining from the base.

AWARD OF MERIT.

Cypripedium × Ultor (Lawrenceanum ♀ Sanderianum ♂), from REGINALD YOUNG, Esq., Fringilla, Linnet Lane, Sefton Park, Liverpool (gr., Mr. T. J. Poyntz).—The plant from which the flower was taken was shown at the last meeting and described in the *Gardeners' Chronicle* report July 11, 1903, p. 28. The plant, which is a very free grower, has beautiful light-green foliage reticulated with dark-green, and handsome flowers with an Indian-yellow ground colour, the upper sepal having a chocolate-purple central band with five or six dotted dark-purple lines on each side. The petals, 6 inches in length, were arched as in C. Sanderianum, and bore on the lower halves the inverted purple markings as in that species, the outer portions being rose colour. Lip large and of a rosy-mahogany colour. The long ovaries derived from C. Sanderianum display the flowers better than in others of the class.

BOTANICAL CERTIFICATE.

Cirrhaea Warreana, from Messrs. SANDER & SONS.—A singular species, with short, dense, pendulous racemes of insect-like flowers of a yellowish-green tint marked with purple. The singularly formed labellum is white, blotched with purple, the apex being emerald-green with dark markings.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq., in the Chair; and Messrs. Jos. Cheal, Henry Eslings, Geo. Woodward, S. Mortimer, A. Dean, W. Bates, Geo. Kelf, R. Lewis Castle, J. Jaques, C. G. A. Nix, J. Willard, A. H. Pearson, H. Balderson, and Owen Thomas.

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, S.W., exhibited fruits of a new Strawberry raised from a cross between Waterloo and Lord Napier. The fruit is very dark in colour, and similar in appearance to Waterloo. The variety is to be tried at Chiswick.

Mr. WILL TAYLER, Osborn Nursery, Hampton, Middlesex, exhibited six fruits of a Peach named "Libra," a seedling from Early Alexander.

Mr. H. BECKER, Imperial and Cæsarian Nurseries, Jersey, exhibited some large fruits of a yellow Gooseberry named Grouville Giant; also some Perfection type Tomatos named Becker's Excel-All, of remarkably good appearance.

HOBBIES, LIMITED, Norfolk Nurseries, Dereham, exhibited some fruits of a Cucumis under the name of Lemon Cucumber. The fruits were about the size of small Lemons, with irregular furrowed exterior, and the flesh and flavour almost identical with those of the Cucumber.

Messrs. JNO. K. KING & SONS, Coggeshall, Essex, exhibited a collection of garden Peas, including as many as sixty-four varieties, all in good condition (Silver Banksian Medal).

Awards.

FIRST-CLASS CERTIFICATE.

The Loganberry, which has been described and exhibited so many times, was shown by Messrs. JAS. VEITCH & SONS, who had excellent fruits and plants of same. It is supposed to be a hybrid between the Raspberry and an American variety of Blackberry, and produces fruits an inch long, purplish-black, with a greyish shade over. The fruits are luscious, with a pleasant acidity, and the plants crop very freely.

CHISWICK, JULY 14.—A second meeting of the Fruit and Vegetable Committee was held here on the above date. Present: Mr. Bunyard, in the chair; and Messrs. O. Thomas, W. Bates, H. Eslings, J. Jaques, H. Markham, S. Mortimer, G. Wythes, G. Kelf, and A. Dean.

Prior to the usual business, Mr. Bunyard feelingly referred to the severe illness from which his esteemed colleague Mr. William Marshall is suffering, and suggested that Mr. Wright send him from that Committee a cordial expression of sympathy.

Mr. Bunyard handed round a boxful of fine rich-coloured and capital-flavoured fruits of Mr. Peters' new Strawberry, Givon's Late, which has had a First-class Certificate awarded to it. The sample evoked the warmest commendation. It seems to do remarkably well at Maidstone.

The large collection of mid-season and late Peas was then inspected, and First-class Certificates were awarded to Peerless (Sutton & Sons), a very fine cropping 3-foot marrow of high quality; and to Improved Monarch (C. Sharpe & Co.), a tall, robust variety and a heavy cropper. Awards of Merit were given to Coleman's Favourite, 3 feet high, a very abundant cropper; Webb's Kaiser, 3 feet, pods long, green, and of high quality; Rivenhall Wonder (Cooper, Taber & Co.), only 20 inches in height, a remarkable cropper; Aristocrat (Sharpe & Co.), 4 feet high, of great excellence; Sherwood Forest (Hurst & Son), a fine tall Pea, carrying a great crop of pods; Progression (Jas. Veitch & Sons), tall, and a heavy cropper; and Feltham Gem (Veitch & Sons), 2 feet in height, carrying an abundant crop.

Two breadths of spring-sown Cabbages were seen, but both were irregular stocks, and tending to coarseness. There is a big collection of Potatos to be seen later, the majority showing robust growth. The trial of Vegetable Marrow plants now looks more promising, the plants, mulched with manure, having made a good start. Kidney Beans also will soon be ready for examination.

RAYLEIGH AND DISTRICT HORTICULTURAL.

JULY 15.—The third annual exhibition of plants, flowers, fruits, and vegetables was held on the above date in a meadow adjoining Rayleigh town, the weather and attendance of visitors being everything that could be desired by the most anxious committee and treasurer.

The exhibits, staged in three marquees, showed in number and quality a great improvement upon pre-

vious years, especially in the Cottagers' classes, which generally were well contested, thereby showing that the efforts of the Society to promote a better knowledge of the cultivation of plants, flowers, fruits, and vegetables, among those residing in this part of the county, are meeting with deserved success.

Mr. A. Mathews, gr. to A. C. CORK, Esq., Barringtons, Rayleigh, was the most successful exhibitor among gentlemen's gardeners. He took nine 1st and four 2nd prizes in the principal classes for collections and specimens of stove and greenhouse plants, exotic Ferns, group of miscellaneous plants arranged for effect, Fuchsias, fruit, &c. The several exhibits staged by Mr. MATHEWS bore evidence of cultural skill, and were clean, healthy, and fresh looking. His half dozen exotic Ferns included excellent plants of *Adiantum cuneatum* and *Nephrolepis exaltata*.

Other successful exhibitors in this class were Mr. W. Denyer, gr. to GEORGE VERNELL, Esq., The Elms, Rayleigh; Mr. Francis, gr. to W. H. CLARKE, Esq., White House, Rayleigh, who took 1st for twenty-four Roses, and 1st for a collection of Sweet Peas, which included good blooms of Lady Grisell Hamilton, Gorgeous, and Salopian; and Mr. Sears, gr. to W. FOX, Esq., Hockley. In the Ladies' classes for table decorations and bouquets, Miss MABEL TAYLOR took two 1sts and one 2nd for bouquets, consisting of choice flowers arranged to the best advantage. Mrs. and Miss CORK (Barringtons); Miss LONSDALE, Rayleigh House, Rayleigh; Mrs. GRAYSON, The Poplars, Rayleigh (whose elegant arrangement of suitable flowers for dinner-table deserved a higher award); and Mrs. ARDLEY, were also successful exhibitors in these classes, which were well contested, and attracted a good deal of attention from visitors.

FORMBY HORTICULTURAL.

JULY 15.—The Liverpool Horticultural Association has not for several years held its summer show, consequently exhibitors have drifted to other centres. Formby, sheltered as it is behind a huge stretch of sand-hills, may now lay claim to be one of the leading shows. In no other part of Lancashire are Roses so finely grown, and the texture and colour of the blooms are excellent. The inhabitants of Formby are very enthusiastic horticulturists, and the Committee, consisting entirely of gentlemen amateurs who work together amicably, are able to acquire fine prizes, the Rose section alone having for its share eleven Silver Cups.

For twelve varieties distinct, Mr. B. KENNEDY, a noted grower whose garden is one of the sights in the district, staged a grand box, the best of which were Medea, La France, Killarney, A. K. Williams, Captain Hayward, and Duc de Rohan; Mr. F. A. ROCKLIFF, 2nd. Mr. KENNEDY also won with twelve Teas or Noisettes with charming blooms of Maman Cochet, Cleopatra, Kaiserin Auguste Victoria, and Madame Cusin: Mr. F. A. ROCKLIFF was again 2nd.

For a stand of twelve in not less than six varieties, Mr. KENNEDY was 1st with handsome flowers of Empress Alexandra of Russia, Mrs. E. Mawley, and Innocente Pirola. He was also 1st with a splendid vase of La France.

The competition was keen in the other classes, the winners of the higher prizes being Messrs. LUTHER WATTS, T. CARLYLE, T. PUGH, G. LUNT, and G. H. PAGE. National Rose Society's Silver Medals were awarded for the best blooms to Mr. W. DODD for Caroline Testout; and to T. CARLYLE for blooms of Maman Cochet.

The Sweet Pea class for twelve distinct varieties, not more than twenty spikes of each, brought out six competitors, Mr. W. DODD for the third year in succession securing the valuable Five-guinea Silver Cup presented by Mr. H. Middlehurst, with fine flowers of the following:—Black Knight, Countess of Lathom, Lady Grisell Hamilton, Dorothy Eckford, Salopian, Prima Donna, Gorgeous, Emily Eckford, Miss Willmott, Jeannie Gordon, Hon. Mrs. Kenyon, and Blanche Burpee; Mrs. LUTHER WATTS, 2nd; Mr. E. E. ALLEN, 3rd.

Stove and greenhouse plants were not of large size, but of fine quality; the tuberous-rooted Begonias from Mr. L. WATTS, the Pelargoniums from Mr. J. FORMBY, and Gloxinias from Mr. E. STOREY, and Ferns from Mr. ROCKLIFF made attractive features.

Hardy fruits and vegetables were admirably shown.

Orchid.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 17.—The members of the Committee present on this date were Messrs. Cypher, Duckworth, Holmes, Upjohn, Parker, Rogers, MacNab, Cowan, and Weathers (hon. sec.).

Exhibits at this season are always scarce. Messrs. J. CYPHER & SONS, Cheltenham, exhibited two good hybrid *Cypripediums*—viz., C. × Transvaal and C. × Phoebe, Cypher's var., both of which received an Award of Merit. The former is a good cross between C. × Rothschildianum × C. Chamberlainianum, and is a fine tall flower, intermediate in character. The second cross is between C. bellatulum × C. laevigatum, and somewhat resembles C. × Vipani.

S. GRATIUS, Esq., Whalley Range (gr., Mr. Cypher), received First-class Certificates for *Laelio-Cattleya Martineti*, West Point var., and *Laelio-Cattleya* × *Ingrami*, Gratrix's var., both being excellent forms and worthy of distinct varietal names.

W. DUCKWORTH, Esq., Flixton (gr., Mr. Tindall), exhibited the beautiful *Miltonia vexillaria* var. *Queen Alexandra*, a chaste form, which was awarded a First-class Certificate. A Bronze Medal was awarded to the group shown by this amateur.

Messrs. SANDER & SONS, St. Albans, received a Bronze Medal for a nice group, which contained several hybrid *Laelio-Cattleyas*, and a few good forms of *Miltonia vexillaria*.

CHAS. PARKER, Esq., Ashton-on-Ribble, exhibited a good *Cypripedium* hybrid, C. × *Cassandra*, the parents being C. × *Goweri* × C. *Sanderianum*. The flowers were rather young, but gave promise of being a valuable addition to the already large stock of hybrids (Award of Merit).

Mr. A. J. KEELING staged a small group of plants, to which a Vote of Thanks was awarded. P. W.

NATIONAL CARNATION & PICOTEE.

JULY 21.—Probably never before was a finer display of Carnations and Picotees made by the above Society than that brought together in the Drill Hall, Westminster, on this occasion. There had been times when growers had experienced some anxiety as to the form their flowers would take in July, but the conditions of weather seemed to have united to produce heads of bloom of a highly satisfactory character. The refined bizarres and flaked varieties were not so numerously produced as in previous years, still there were very fine blooms in some of the stands, and there was a purity and refinement about the white-ground Picotees that could not fail to fascinate. The chief attractions lay in the direction of the glorious selfs, yellow grounds, and fancies, which were displayed to the best advantage; they have come to rival the Malmsons in their size and fulness of petals. The skill of the dresser may, and indeed does, something in the way of re-arrangement of the petals, but it is the grower which provides size, rotundity of petal, and brilliant markings. One could see by the spots at which visitors congregated where the chief attractions of the show lay.

Mr. F. A. WELLESLEY'S marked success in Division I., in which he was also the recipient of the Cup awarded to the exhibitor who gained the highest number of points was well deserved, and no one withheld congratulations from him. The entries in the smaller classes were unusually numerous, testifying to the number of devotees that are being attracted to the charmed circle of Carnation culture.

Improvements in staging are necessary; too little room was reserved for some of the classes—a defect which can be readily remedied by a little simple calculation. It is a pity judging does not commence at the time specified, and not three quarters of an hour afterwards. It is unfair to those exhibitors who stage their flowers in good time that they should have to stand exposed to heat and dust so long after the proper time named for an inspection by the judges. Necessary reforms find their way slowly into the practice of special floricultural societies.

DIVISION I.

This comprehended the leading classes, and was open to growers of large collections. It may be stated that in the following five classes for twenty-four blooms there were required no fewer than twelve varieties.

Carnation Blooms, Bizarres and Flakes, white grounds.—With twenty-four blooms, there were three entries, Mr. THOMAS LORD, florist, Hole Bottom, Todmorden, taking the 1st prize with a stand containing some refined, pure, brilliantly marked flowers, chief among them P. F. Gordon Lewis, C. B. J. S. Hedderly, S. B. Robert Hougrave, R. F. Merton (a beautiful variety), C. B. George, C. B. Master Fred, S. B. Robert Lord, P. P. B. William Skirring, S. F. Sportsman, P. F. Geo. Melville, C. B. Guardsman, C. B. J. D. Hextall, S. B. Admiral Curzon, R. F. Mrs. T. Lord, and R. F. H. Shoe-smith. Mr. MARTIN H. SMITH, Hayes Common, Kent (G. Blick, gr.), came 2nd, also with some good flowers, the principal of which were new varieties of his own raising, such as S. B. Dorothy and Halin, C. B. Nestor and Adonis, P. P. B. Elphinstone and J. S. Hedderly, P. F. Geneva and Flava, S. F. Gladiator, R. F. Sweet Nell Markham and Dalby; 3rd, Mr. C. TURNER, Royal Nursery, Slough.

Selfs.—With twenty four blooms Mr. SMITH took the 1st prize with a brilliant set, large, full, and of high quality. He had of maroon and deep crimson shades—Bir Bevs, Gulnare-Kara, Agnes Sorel, and Don John; crimson—Roderick and Duke of Norfolk; scarlet and rose—Barra-Bomba and Waldemar; rose—Anna Boleyn, Helen and Floradora; apricot—Swashbuckler; yellow—Cecilia, The Naiad and Dailodil; white—Hudegarde, Blanche and Mrs. Eric Hambro'. Mr. F. A. WELLESLEY, Westfield, Woking, came 2nd, also with finely finished blooms. He had Agnes Sorel, maroon; Almones, Falcon and Cecilia, yellow; Mrs. W. Mostyn, purple;

Benbow, buff; Mr. J. Douglas, rose; &c. 3rd, Messrs. W. ARTINDALE & SON, florists, Sheffield.

Fancies.—Mr. F. A. WELLESLEY came conspicuously to the fore in this class with large, even, and superbly-finished blooms of Hidalgo, Charles Martel, Monarch, Argosy, Perseus, Amphion, Voltaire, Primrose League, Guinevere, Queen Bess, Paladin, Ormonde, Gipsy Queen, Ossian. Mrs. F. A. WELLESLEY (a beautiful new variety, for a description of which see seedlings), and Charles Martel. Mr. M. H. SMITH was a very good 2nd indeed. His chief flowers were Lily Duchess, Bedemer, Hesperus, Bellicent, Athelstane, A. W. Jones, Queen of the Isles, Cavalier, Corporal Trim, The Seer, Thos. Hidalgo, and Rameses; Messrs. BLACKMORE & LANGDON, Twerton Nursery, Bath, were a good 3rd.

Picotees, White Grounds.—Here Mr. F. A. WELLESLEY was again 1st, having good-sized, pure, well-marked flowers of high quality. Of heavy red edges he had Brunette, W. E. Dickson, Ganymede, and John Smith; light red, E. Thomas William; heavy purple edges, Amy Robsart, Muriel, Miriam, and Fanny Tett; light purple edges, Somerhill; heavy rose edges, W. H. Johnson, Clio, and Mrs. Payne; light rose edges, Fortrose, Nellie, and Favourite. Mr. M. R. SMITH was 2nd also with highly creditable blooms for the season. He had of light red edges, Grace Darling; heavy red edges, Manners, Brownie, and Ganymede; H. P. E. Amy Robsart, Beau Nash, and Miriam; L. P. E. Duchess of York; H. R. E. Tiptop, Mrs. Beswick, Acushla, Little Phil, Miss Sophy Grahame, Duchess of York, and Lady Louisa; L. R. E. Fortrose and Favourite. Mr. C. TURNER was 3rd.

Picotees, Yellow Grounds.—Mr. M. R. SMITH came 1st in this class with some beautiful blooms, chief among them Gronow, Badoura, Pere, Lucy Glitters, Espoir, J. Seult, Schiller, Chryseis, Verena, Laura, Leonora, Koh-i-noor, Speranza, (a fine new variety), Dalkeith, Lord Napier, and Mrs. Walter Heriot. Mr. F. A. WELLESLEY came a close 2nd; 3rd, Messrs. ARTINDALE & SON.

Single Blooms.—With six blooms of any one variety of self Carnation, Mr. SMITH was 1st with Daffodil, a fine pure yellow flower; Mr. F. A. WELLESLEY came 2nd with Germania, still very good; and Mr. C. TURNER with Sir Bevs.

With six blooms of any yellow or buff fancy, Mr. F. A. WELLESLEY came 1st with Mrs. F. A. Wellesley; Mr. M. R. SMITH 2nd with King Solomon, heavily marked with vivid red on a light ground; 3rd, Messrs. BLACKMORE & LANGDON, with Richness, a fine new variety.

With six blooms of one variety of fancy Carnation Messrs. BLACKMORE & LANGDON were placed 1st with perfect blooms of Millie (pure white with some slight rose pencillings at the point of each petal, one of the most distinct varieties in cultivation); Mr. F. A. WELLESLEY was 2nd with the same variety; and Mr. M. R. SMITH was 3rd with Jno. Sebright, a beautiful flower, bright pinkish-rose, handsomely marked (for description see seedlings).

The best six blooms of a yellow ground Picotee were those of Mrs. WALTER HERIOT, a variety of good quality with a mere edge of rose; Mr. WELLESLEY came 2nd with Lady St. Oswald; and Messrs. ARTINDALE & SON 3rd with Childa Harold.

Flowers in small Vases.—With twelve varieties of selfs, fancies, or yellow grounds, three blooms of each, without dressing, Mr. M. R. SMITH was 1st with fine blooms admirably staged, but unnamed, in defiance of the regulations; Messrs. BLACKMORE & LANGDON were a good 2nd.

SINGLE BLOOMS.

Scarlet Bizarres.—1st, Messrs. THOMSON & Co., florists, Birmingham, with Robert Hougrave; Mr. F. BUTT was 2nd with the same; and Mr. B. PASH 3rd with Admiral Curzon.

Crimson Bizarres.—1st, Mr. WELLESLEY; 2nd and 3rd, Mr. F. BUTT, in each case with J. S. Hedderly.

Pink and Purple Bizarres.—1st, Mr. D. WALKER, Kilmarnock, with William Skirring; and Mr. WELLESLEY 3rd with the same; Mr. E. J. WOOTEN was 2nd with Sarah Payne, probably the oldest named Carnation in cultivation.

Purple Flakes.—1st, Mr. W. SPENCER, Windsor; and 2nd, Mr. WOOTEN, with Geo. Melville; Mr. J. FAIRLIE coming 3rd with Gordon Lewis.

Scarlet Flakes.—1st, Mr. WOOTEN with Sportsman; 2nd, Messrs. THOMSON & Co., with J. J. Keen, a vividly-marked new variety of decided promise; Mr. B. PASH coming 3rd with Sportsman.

Purple Flakes.—1st and 2nd, Messrs. W. PEMBERTON & SON, Walsall, with Merton; and it was 3rd also, being shown by Mr. WOOTEN. Indeed, it gained all the five prizes awarded in this class.

Selfs, Blush or White.—1st, Mr. R. C. CARTWRIGHT, and 2nd, Mr. A. J. COOK, with Ensign, one of Mr. Smith's white selfs; and the former was also 3rd with Much-the-Miller.

Rose or Pink.—1st, Mr. W. H. PARTON, Birmingham, with Lady Hermione; Mr. WOOTEN coming 2nd with a seedling, and Mr. COOK 3rd with Bomba.

Scarlet, Red or Crimson.—1st, Mr. SPENCER with a scarlet self sport from S. F. John Wormald; Mr. CAR-

WRIGHT being 2nd with a seedling; and Mr. WALKER 3rd with Siraar, brilliant in colour.

Maroon or Purple.—1st, Mr. E. CHARRINGTON with Helco, crimson-purple shaded with mauve; and 2nd with the same. Mrs. W. Mosyn, a purple self, was 3rd, the name of the exhibitor not stated.

Yellow.—1st, Mr. WOOTTEN with Almoner; Mr. E. CHARRINGTON being 2nd and Mr. SPENCER 3rd, both with Germania.

Buff.—Mr. Smith's Benbow won all the prizes. Mr. WELLESLEY was 1st, and Mr. R. C. CARTWRIGHT 2nd and 3rd.

Fancy Yellow Ground.—Mr. NASH came 1st with Monarch, Mr. WELLESLEY 2nd with Mrs. F. A. Wellesley, and Mr. CARTWRIGHT 3rd with Argosy.

Other Fancy than Yellow Ground.—1st, Mr. SMITH with Nestor, white ground pencilled with crimson; Mr. CARTWRIGHT was 2nd, and Mr. WOOTTEN 3rd with Artemus, with scarlet flakes on a lavender ground.

Picotees.—H. Red Edging: 1st, Mr. PASH, with Thomas Anstiss; 2nd, Mr. J. J. KEEN; and 3rd, Messrs. PEMBERTON & SON with John Smith, L. Red E.: 1st, Mr. KEEN, and 2nd, Mr. SPENCER with Thomas Witham; Mr. BUTT coming 3rd with Grace Darling, H. Pink E.: 1st, Messrs. THOMSON & Co. with Fanny Tett, a fine variety of the late Mr. Dodwell's raising; Messrs. PEMBERTON & SON were 2nd with Amy Robsart; Mr. BUTT coming 3rd also with Fanny Tett, L. Pink E.: 1st, Mr. WELLESLEY with Somerhill; 2nd, Mr. WOOTTEN with Pride of Leyton; 3rd, Mr. BUTT with Lavinia, H. E. Rose or Scarlet: 1st, Mr. WOOTTEN, with Fortrose, having a heavy edge; Messrs. PEMBERTON & SON came 2nd with Lady Louisa; and Mr. SPENCER 3rd with Mrs. Payne, L. E. Rose or Scarlet: 1st, Mr. WOOTTEN, and 2nd, Mr. SPENCER with Favourite; 3rd, Mr. WELLESLEY with Fortrose, H. E. Yellow Ground: 1st, Mr. KEEN with Gronow; 2nd, Mr. SMITH with Dalketh; this variety was also 3rd, but no exhibitor's name was attached. L. E. Yellow Ground; 1st, Mr. SMITH with Mrs. W. Heriot; 2nd, a flower without name of variety or exhibitor; Mr. NASH coming 3rd with Heliodorus.

Premier Blooms.—Bizarre, C.B. J. S. Hedderley, shown by Mr. WELLESLEY; and he also had the premier flake in P.F. Gordon Lewis, finely coloured. Self, Ensign, white, from Mr. CARTWRIGHT. Fancy, Mrs. F. A. Wellesley, shown by Mr. WELLESLEY. H.E. white-ground Picotee, H.E. John Smith, H. Red E., shown by Mr. J. J. KEEN. L.E., L.P.E. Lavinia (Douglas), from Mr. A. J. ROWBERRY. H.E. yellow ground, Dalkeith, from Mr. M. R. SMITH. L.E.Y.G., Childe Harold, a beautiful bloom, from Mr. H. E. BUCKLAND.

A valuable Cup offered by the President, Mr. M. R. Smith, for the winner of the greatest aggregate number of points in Division I., was taken by Mr. F. A. WELLESLEY.

DIVISION II.

The exhibitors in this division were generally growers of smaller collections, and here Mr. W. SPENCER, of Windsor, came to the fore, showing splendid blooms in some classes, and gaining the greatest number of points. He became the winner of the Silver Cup offered by the President in this division.

Carnations, Bizarres, and Flakes. With twelve blooms distinct, Messrs. PEMBERTON & SON, Walsall, were placed 1st, chief among their flowers were—R. F. Merton, S. F. Flamingo; P.P.B., J. D. Hextall; P.T. Geo. Melville; R.F. Mrs. Rowan; P.F. Charles Henwood; S. B. Robert Houldgrave, and S.F. Sportsman; Mr. W. SPENCER came a good 2nd, and Messrs. THOMSON & Co. were 3rd.

With twelve Sells, Mr. SPENCER came 1st with very fine blooms of Almoner, Barras, Hildogarde, Jocelyn (a heliotrope self), Sultan, Much-the-Miller, Orpheus, Orlon (a fine bluish self), Benbow, Germania, Helen, and Britannia; Messrs. THOMSON & Co. were 2nd, with excellent blooms of Enchantress, Mrs. F. Sims, The Sirdar, Vivian, &c.

With twelve fancies, Mr. SPENCER again won the 1st prize with superb blooms of Paladin, Voltaire, Galileo, Argosy, Artemus, Queen Bess, Monarch, Ormonde, Mrs. Tremayne, Oberon, and Amphion, a valuable selection; Messrs. THOMSON & Co. were 2nd.

With twelve white-ground Picotees, Mr. B. NASH, Woking, came 1st with nice neat pure flowers; Messrs. PEMBERTON & SON were 2nd; and Mr. NASH was also 1st with twelve Y.G. Picotees, staging excellent blooms of Heather Bell, Lady St. Oswald, Lady Bristol, Heperia, Evelyn, Mohican, Mrs. Douglas, &c.; Messrs. THOMSON & Co. were 2nd.

The best six blooms of a self Carnation, one variety, were Mrs. Eric Hambro', white, from Mr. SPENCER; Mr. NASH coming 2nd with the same. With six blooms of a yellow or buff fancy, Mr. SPENCER came 1st with a grand Voltaire; Mr. B. NASH was 2nd with Mrs. Tremayne.

With six blooms of one variety of fancy Carnation other than yellow or buff, Mr. E. CHARRINGTON came 1st with Ivo Sebright (see seedlings); and Mr. BROOKES SMITH was 2nd with a variety bearing her name, white flaked with rosy-crimson. With six blooms of any yellow ground Picotee, Mr. H. W. MATHIAS came 1st with the Pilgrim; Mr. NASH 2nd with Heliodorus.

With six varieties of selfs, fancies, and yellow grounds, Mr. S. MORRIS, Wrexham Hall, Thelford, with very fine blooms; Mr. W. SPENCER, being 2nd.

DIVISION III.

contained smaller classes, some ten in number for those growing a limited number of plants. The blooms were shown both on boards and in bottles. Mr. JAS. FAIBLE took the 1st prize for six bizarre and flake Carnations; Mr. CARTWRIGHT for the best six selfs, and also for the best six fancies; Mr. W. E. WILSON coming 1st with six Picotees; and Mr. E. H. BUCKLAND for six yellow-ground Picotees (in this stand was the very fine bloom of Childe Harold, selected as the Premier Y.G. Picotee in the show).

In the class for three blooms, Mr. E. CHARRINGTON was a successful exhibitor. A Cup was also offered in this division, and it was awarded to Mr. R. C. CARTWRIGHT. The entries were very numerous in this division.

Undressed Flowers (without Cards).—Seven classes were set apart for these, and the schedule of prizes set forth that "there must be no manipulation of the calyx, and a split pod is a disqualification." Some of the blooms were fair good in each, and some excellent flowers were staged. Mr. E. J. WOOTTEN was a successful exhibitor in these classes, and he was awarded a Silver Cup, having gained the highest number of points. A class for six blooms of any type was also set apart for those who have never won a prize at any exhibition of the Society, and it is therefore a kind of recruiting ground for it.

Carnations in Pots.—This appears to be a declining feature, as although four classes were provided, there was but one entry, that in the class for a group to cover 50 square feet. This was from Mr. C. TURNER, and was awarded the 1st prize.

Floral Decorations.—Mr. C. BLICK was 1st for two bouquets of Carnations, one was of white, the other of mixed colours, and they were nicely arranged with elegant foliage; Mr. D. OLIVER was 2nd, having one of white, the other of pink Carnations. Mr. BLICK was 1st for a vase of Carnations, having a bold arrangement of good blooms and foliage; Mr. HEALING, Reigate, was 2nd. Mr. SPENCER had the best three sprays, and Mr. BLICK the best three button-holes.

SEEDLING CARNATIONS AND PICOTEEES.

Certificates of Merit were awarded to the following:—

Fancy Carnation Mrs. F. A. Wellesley.—Pale sulphur ground, with markings of rose, scarlet, and maroon on the petal edges; a highly refined variety with stout shell petals and full substance. From Mr. F. A. WELLESLEY, Woking.

Fancy Carnation Ivo Sebright.—A novel and beautiful variety; the ground rosy-pink with flakes of pale heliotrope towards the edges. From Mr. M. V. CHARRINGTON, Edenbridge.

Yellow Picotee Speranza.—Pale yellow ground, heavily edged with deep rose, fine and distinct. From Mr. MARTIN R. SMITH, Hayes.

Fancy Carnation Richness.—A rich and striking variety, yellow ground, heavily edged with bright red; extra fine quality. From Messrs. BLACKMORE & LANGDON, Twerton Nursery, Bath.

MISCELLANEOUS COLLECTIONS OF CARNATIONS.

Messrs. CUTBUSH & SON, Highgate Nurseries, N., staged a bold and striking ground group of Carnations, including Malmaisons, and interspersed with foliated plants. Merlin, Sabrina, and Brigadier were very good yellow-grounds; and among the Malmaisons was one having a large flower of a crimson colour. The Royal Horticultural Society awarded a Silver-gilt Banksian Medal.

Messrs. VEITCH & SONS, King's Road, Chelsea, had a table-group of Carnations in pots, which included Trojan, white self; Galatea, yellow ground; Mrs. C. Baring, fancy; Lord Roberts, yellow self; Queen of Scots, salmon; Bendigo, purple; Mrs. Nicholson, deep pink, &c.

Messrs. J. PEED & SONS, nurserymen, West Norwood, had Malmaison and other Carnations in pots nicely displayed with Palms, Ferns, &c.

Messrs. PHILLIPS & TAYLOR, Carnation Specialists, Bracknell, had vases of various Carnations; and also Bamboo stands of the same with Water-Lilies in front.

Mr. R. H. BATH, LTD., Wisbech, had a large collection of Carnations in pots, bearing blooms of good quality, and also small vases of blooms.

A notable exhibit was the noble vases of Carnations set up by Mr. A. T. DUTTON, The Nurseries, Bexley Heath, Kent, and which suggested a future feature for the National Carnation Show. A table of such vases would be indeed an alluring feature. The varieties were Royalty, soft, pleasing pink; G. H. Crane, brilliant scarlet; Mr. Thos. W. Lawson, a very fragrant pink; and Madame Melba, delicate pink, a lovely variety. The blooms were all on long stems, and arranged with great taste, fit for the table at any royal function. The Carnation Society could make no further award than a

Certificate of Merit (the Royal Horticultural Society awarded a Silver Flora Medal).

Mr. JAMES DOUGLAS, Edenside Nurseries, Great Bookham, exhibited a number of fine flowers of new and choice varieties, and was awarded a Silver Banksian Medal by the Royal Horticultural Society.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period July 12 to July 18, 1903. Height above sea-level 24 feet.

Remarks.—Rather dull weather, with some thunder-showers towards the end of the week.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 18, is furnished from the Meteorological Office:—

"The weather was fine at the opening of the period, but gradually became very unsettled over the whole kingdom. Very heavy rains were experienced at several western and northern stations between the 14th and 16th, and in London and at Shoeburyness on the 17th. Thunder-storms were rather general over the central and southern parts of England towards the end of the week.

"The temperature was below the mean in most districts, the deficit in Scotland, N. and E. being 4° and 5° respectively. In England, S, Ireland, S., and the Channel Islands, however, the mean was just equalled. The highest of the maxima were recorded on somewhat irregular dates as a whole, but on Wednesday over the more southern parts of England. They ranged from 77° in England, S. and Ireland, S., to below 70° in England, N.W. and over Scotland, and to 64° in Scotland, N. The maxima on the north and north-east coasts of Great Britain were frequently very low—55° or even less. The lowest of the minima—registered, as a rule, either on the 13th or 14th—varied from 35° in Scotland, E., and 37° in Scotland, N., to 40° or a little higher in most other districts, and to 49° in the Channel Islands. Thermometers exposed on the grass during the night of 13th-14th recorded 31.1° at Fort William, and 33.1° at Hillington.

"The rainfall exceeded the mean generally, but only just equalled it in the Midland Counties, England, S.W., and the Channel Islands, and was less in Scotland, N. and England, S. The heaviest aggregate fall for the week was 2.72 ins. at Aspatria, but the heaviest amount for any one day was at Douglas on Tuesday, when 1.64 ins. was collected. This was closely followed by 1.50 ins., which fell within five hours in London during the early hours of Saturday.

"The bright sunshine was deficient excepting in Scotland, N., and the Channel Islands. The percentage of the possible amount of duration ranged from 52 in the latter district, and 33 in England, S., to less than 20 in Scotland, E., and England, N.E., and to only 10 in Ireland, N."

THE WEATHER IN WEST HERTS.

Cool and Showery Weather.—On one day the temperature in the thermometer screen never rose above 56°, which is about 12° colder than is seasonable, and on

the coldest night the exposed thermometer fell to within 3° of the freezing-point. As a rule, however, the nights were fairly warm. The soil is now at about an average temperature at 2 feet deep, but 2° colder than is reasonable at 1 foot deep. Rain fell on four consecutive days to the total depth of rather more than ½ of an inch. Previous to this there had been no rain worth mentioning since June 19, or for very nearly a month. Of the rainfall above mentioned about a tenth of an inch has come through the bare-soil percolation gauge. For three weeks previously there had been no measurable percolation through that gauge. On two days during the week no sunshine at all was recorded, and on two others the sun shone for less than a quarter of an hour. Throughout the week the atmosphere has been very calm, and on one day the total record for the twenty-four hours was only ⅙ miles—making this the calmest day I have yet recorded here in July. The amount of moisture in the air was on most days exceptionally large for the time of year. *E. M., Berkhamsted, July 21, 1903.*

MARKETS.

COVENT GARDEN, July 23.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. ED.]

REMARKS.—A few home-grown Apples are coming in, realising 4s. to 4s. 6d. half-bushel. The Cherries are very much cracked, owing to the recent rains. Some really good Strawberries only are in request, and they are worth as much as 18s. dozen punnets. Some Italian Pears in baskets, 4s. Lisbon Apples in large cases fetch 12s. to 13s. Cape Oranges, box or tray, 1s. 6d. to 2s. Some good French Tomatoes in pecks are selling for 2s. 6d., and in crates at 4s. Foreign Green Gages in boxes fetch 1s. to 2s. 3d., according to size; in pecks and half-bushels, 4s. to 12s. 6d. respectively.

POTATOS.

French, 4s. to 5s. per cwt.; home-grown, 5s. to 6s. 6d. per cwt. *John Bath, 32 & 34, Wellington Street, Covent Garden.*

FRUITS AND VEGETABLES.

GLASGOW, July 22.—The following are the averages of the prices during the past week:—Apples, Australian and Tasmanian, 12s. to 16s. per box; Tomatoes, 6d. to 1s. per lb.; Oranges, Valencias, ordinary, 420's, 22s. to 23s. per box; large 420's, 21s. to 27s. do.; extra large 420's, 25s. to 30s. do.; 714's, 27s. to 30s. do.; Lemons, 6s. to 10s. per box, and 7s. to 14s. per case; Grapes, English, 1s. to 2s. 6d. per lb.; Onions, 6d. per bag and case; Cherries, 6d. to 8d. per lb.; Strawberries, 4d. to 9d. do.; Dublin Gooseberries made from 21s. to 24s. per cwt.; Scotch do., 21s.; and Dutch 19s.; Dutch Carrots, 4s. to 7s. 6d. per hamper.

LIVERPOOL, July 22.—Wholesale Vegetable Market.—Potatoes, per cwt., Kidneys, 6s. 9d. to 8s.; Early Regents, 4s. 9d. to 5s. 6d.; New, 1s. 6d. per 21 lb.; Turnips, 6d. to 8d. per 12 bunches; Carrots, 8d. to 10d. do.; Onions, foreign, 4s. 9d. to 5s. per cwt.; Parsley, 4d. to 6d. per dozen bunches; Lettuces, 6d. to 10d. per dozen; Cucumbers, 1s. 6d. to 3s. do.; Cauliflowers, 1s. to 2s. 6d. do.; Cabbages, 6d. to 1s. 2d. do.; Peas, 7s. to 8s. per hamper; Beans 2s. 9d. to 3s. 6d. do. *St. John's*—Potatoes, new, 1d. to 1½d. per lb.; Asparagus, 2s. to 4s. per 100; Peas, 1s. to 1s. 6d. per peck; Cucumbers, 3d. to 6d. each; Apricots, 1s. to 1s. 6d. per dozen; Gooseberries, 3d. per lb.; Currants, white, 4d. do.; do., Red, 4d. do.; do., Black, 6d. do.; Cherries, 6d. to 8d. do.; Strawberries, 6d. to 8d. do.; Grapes, 1s. 6d. to 3s. 6d. do.; Pines, foreign, 4s. 6d. to 6s. each; Mushrooms, 1s. per lb. *Birkenhead*—Potatoes, 1s. 6d. per peck; do., new, 1d. per lb.; Peas, 10d. to 1s. 6d. per peck; Cucumbers, 2d. to 4d. each; Strawberries, 4d. to 8d. per lb.; Currants, Red, 6d. to 8d. do.; do., Black, 8d. to 10d. do.; do., White, 6d. to 8d. do.; Peaches, 4d. to 6d. each; Cherries, 6d. to 10d. per lb.; Apricots, 1s. to 1s. 6d. per dozen; Gooseberries, 3d. to 4d. per lb.; Grapes, English, 2s. to 4s. 6d. do.; Tomatoes, English, 6d. to 8d. do.; Mushrooms, French, 1s. to 1s. 4d. do.; Filberts, 8d. do.

CORN.

AVERAGE PRICES OF British Corn (per imperial qt.), for the week ending July 18, 1903, and for the corresponding period of 1902, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

ENQUIRY

CATTLE POISONING BY BUTTERWORT. — Mr. F. W. Moore, of the Botanic Gardens, Glasnevin, would be glad if any of our readers could inform him if they know of an authentic case of cattle being poisoned by eating the Butterwort, *Pinguicula vulgaris*. Personally he is inclined to believe that this plant is harmless, and that it is not eaten by cattle; but there is such a widespread belief in Ireland to the contrary, and he is so often asked for information as to how *Pinguicula* can be eradicated, and its baneful influence on cattle counteracted, that he is induced to seek information concerning the plant, and its effects, if any, upon cattle.

TRADE NOTICES.

THE writer of the note in our last issue, p. 42, omitted to state that he (Mr. Golding) had only purchased the local retail business carried on at No. 199, High Road, Kilburn, until recently as a branch by Mr. W. H. Hudson, of 34, High Road, Chiswick.

THE business of nurseryman, market-gardener, and fruit-grower, hitherto carried on at Claydon Gardens, Claydon, Bucks, has been taken over by the Claydon Nursery Co., who have appointed Mr. J. Milsom as their general manager, to whom all business communications should be addressed.

BELL & BIEBERSTEDT.—Mr. Alexander Cross, formerly of Cross & Donaldson, desires us to inform our readers that he has joined the staff of Messrs. Bell & Bieberstedt, wholesale seed-merchants and growers, Leith.

ANSWERS TO CORRESPONDENTS.

** The reports which our Correspondents have kindly sent us upon the condition of the FRUIT CROPS will be published in our next issue.

** EDITOR AND PUBLISHER.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the literary department, and all plants to be named, should be directed to the EDITOR. The two departments, publishing and editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

BLACK GRAPES: S. T. The fruit sent shows no trace of mealy-bug or of stickiness. It is unlikely that the exudation of sap, as the gardener suggests, would occur to cause this, unless aphides had perforated the leaves and green shoots. The excrements of these insects when abundant cause stickiness, as witness the honey-dew of Lime-trees when infested with aphides. The Grapes were of fine size and colour. Mealy-bug is difficult to

eradicate. The usual dressing the Vines receive should be supplemented by lime-washing the walls, cleansing the hot water-pipes and the woodwork and glass, and the removal of the surface-soil to a depth of 3 inches, replacing it with fresh loam. During spring and summer a sharp look out must be kept for isolated specimens, touching these with a camel-hair pencil dipped in methylated spirits. The sum of 2s. 6d. kindly sent for the Royal Gardeners' Orphan Fund will be sent to the Treasurer of the Fund.

CORRECTION.—*Vide* report of Croydon show, Fruit classes, p. 46, in *Gardeners' Chronicle*, July 18, for "Barber," Castle Hill Gardens, read "Barks."

CUCUMBER PLANTS FAILING: *J. J. P., Stroud.* The plants are suffering from the Spot-fungus (*Cercospora*); but that is not the whole cause. We suspect something wrong at the root. Please send roots, &c.

CUT FLOWERS FOR MARKETING: *J. D.* Just what you please. Study our market reports, cultivating any plants there named that you like and will best suit your purpose. If you do not know anything about their cultivation, go into a market establishment for a year or two and acquire the necessary knowledge, otherwise it is probable that you will lose your money. Gardening, like everything else, has to be learned by experience, and even flowering plants in pots will not give satisfaction unless intelligently handled.

EARLY HIGH-COLOURED RHUBARB: *Enquirer.* The earliest, Daw's Champion, Myatt's Victoria, Linnaeus, and Kershaw's Paragon.

EMPLOYMENT AT KEW: *H. D. P.* Yes; but you may have to wait some time before a vacancy occurs. Apply to the Curator, furnishing copies of testimonials, when, if these be found satisfactory, you will be furnished with a form to be filled up.

GOOSEBERRIES: *W. T.* We are unable to name the fruit.

GRAPE: *M. & Co.* We are unable to name the variety with certainty from such scraps; perhaps White Tokay.

GRAPES: *C. B.* Grape spot. Burn the affected berries. You can do nothing till the leaves are off, then spray the rods very carefully with the Bordeaux-mixture, and again in spring before the leaves are out.—*B. & W.* Specimen rotten when received.

MELON GOING OFF: *Alva.* Material sent quite insufficient. Please send roots, leaves, shoots, and soil.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*S. B.* 1, *Dendrobium Dalhousieanum* of gardens; 2 is not an Orchid, but a Gingerwort, probably *Zingiber officinale* (Ginger-plant), or a close ally of it.—*E. K.* *Cirrhaea viridipurpurea*.—*F. C. L.* A Moss, a species of *Polytrichum* not in fruit.—*A. W. S.* *Trachelium ceruleum*.—*J. R.* A form of the Norway Maple, *Acer platanoides*.—*F. P.* *Adlumia cirrhosa*.—*Sodbury.* The petals had all fallen. It seems very like one we see in the markets.—*Bob.* 1, *Malva moschata*; 2, *Centaurea macrocephala*; 3, *Lysimachia clethroides*; 4, *Lychuis chalcidonica*, double; 5, *Lilium Martagon*; 6, *Ruellia Devosiana*.—*B. F. S.* *Chenopodium olidum*.—*Phyto.* 1, *Circaea lutetiana*; 2 and 3, Willows, quite indeterminate from leaves only; 4, *Rhodiola rosea*.—*J. J. M.* 1, *Codiaeum Queen Victoria*; 2, *C. trilobum*; 3, *C. Evansianum*; 4, *C. van Erstedii*; 5, *C. angustifolium*; 6, *C. Johannis*.—*J. T., Paisley.* *Miltonia Roezlii*.—*E. R.* *Galega officinalis*.—*W. R.* *Spiraea filipendula*, double fl.—*R. D. R.* 1, *Oncidium incurvum*; 2, *Epidendrum oncidoides*; 3, *Celoglyne speciosa*.—*M. K., Potsdam.* Good varieties of *Cattleya Leopoldi*.—*R. G.* 1, *Spiraea Lindleyana*; 2, *Spiraea* sps.; 3, *S. Douglasi*; 4, *Agrostemma coronaria*, richly coloured.—*No Name.* 1, *Agrostemma coronaria*; 2, *Alchemilla alpina*; 3, *Lamium purpureum* var. *aureum*.—*Constant*

Reader. 1, *Linaria purpurea*, white var.; 2, *Sedum album*; 3, *Erigeron mucronatum*; 4, *Euphorbia cyparissias*; 5, *Lathyrus magellanicus*.—*D. W. Y., Chesterfield.* 1, *Lamium purpureum* var. *aureum*; 2, *Adiantum concinnum*; 3, *Adiantum trapeziforme*; 4, *Adiantum hispidulum*; 5, *Adiantum tenerum*.—*C. V. A.* 1, *Juniperus japonica variegata*; 2, *Cupressus pisifera* var. *plumosa* (*Retinospora*); 3, *Cupressus pisifera*, squarrose form (*Retinospora*); 4, *Cupressus pisifera aurea* (*Retinospora*); 5, *Cupressus Lawsoniana aurea*; 6, *Juniperus excelsa*.—*F. D.* *Magnolia cordata*.—*W. C. B.* *Rhus Toxicodendron*; *Lychnis sciscia*.—*G. E. R.* 1, light, *Spiraea callosa*; 2, *Spiraea Bumalda* var.; 3, *Rubus nutkanus*; 4, *Punica granatum*; 5, *Forsythia viridissima*; 6, *Gleditschia*; 7, *Symphoricarpos racemosus* varieties.—*S. H.* *Valeriana officinalis* var.—*W. C., Shrewsbury.* *Sisyrinchium bermudianum*.—*E. G. H.* *Chironia linoides*.

NOTICE TO QUIT SERVICE: *G.* You are entitled to one month's notice, or money in lieu thereof, if there be no written agreement otherwise dealing with the matter.

PARASITE ON PELARGONIUMS: *S. C.* The parasite is *Cuscula epithymum*, Lesser Dodder, more frequent in England than *C. europaea*, common on Heaths, Thymes, and other small shrubby plants. Probably imported in peat or loam employed in the nursery. The plant and the host should be burned as soon as noted.

PALM LEAF: *R. J. L.* The leaf is infested with a scale-insect peculiar to Palms, which may be killed with water at 150° F., or petroleum emulsion used in the proportion as follows: $\frac{1}{4}$ pint petroleum, $\frac{1}{2}$ lb. soft soap, 3 gallons of rain or soft water. Put the soap and petroleum together in a vessel, and with a stick mix them together until there is no liquid left, then add warm water and stir thoroughly. This may be used with a syringe or piece of sponge. The plants should be laid on their sides to drain.

PEACH AND NECTARINE FRUITS INFECTED BY A FUNGUS: *C. Best.* The greenish-black spots are caused by a fungus, *Cladosporium carpophilum*. The sunken spots on the Nectarine by *Gleosporium laticolor*. Nothing can now be done but to gather affected fruits and burn them. Another year apply the Bordeaux-mixture several times after the fruits set.

PEACH STONES SPLITTING AND FRUIT FALLING FROM TREE: *A Constant Reader.* See reply to a question asked by *A. C. D.*, p. 48, in the *Gardeners' Chronicle* for last Saturday.

POTATO-SETS NOT GROWING: *J. T. S.* The Potatos sent afford no evidence as to why they did not grow, and it is hopeless to speculate on the subject. [One of the sets, after remaining in our office for a week, has sprouted strongly.]

ROSE: *E. Kromer.* Some old-forgotten variety of no merit whatever, which we are unable to name. Some of the larger Rose nurserymen might recognise it.

RANUNCULUS: *A. B.* As such perennials as *Begonia tuberosa*, Dahlias, Marvel of Peru, Gloriosas, and the like; and certainly not to be classed as annuals, which have to be raised from seeds, and live for a year only.

REFRIGERATOR: *M. F.* We cannot trace the article you require.

ROSE LEAVES SPOTTED: *W. E. M.* There is no fungus present on the leaves. We suggest that the injury has been caused by some caustic wash or insecticide; or that a powerful sun acting through tiny globules of water (as through a lens) has caused the injury.

SHOWER BOUQUET: *G. R.* The more suitable kinds of flowers are those having a drooping habit, or which can be made to droop without imparting unnaturalness to the arrangement. Flowers of a stiff, formal style of growth are suited only for the upper part of the bouquet, and there only in small numbers. Some varieties of the Rose, such as *Niphetos*, *Maréchal Niel*, *W. Allan Richardson*, and a few other T's and H. T's are admissible. We need not

further specify suitable flowers, as with these few hints you ought, with the aid of Fernfronds and *Myrsiphyllums*, to be enabled to make pleasing bouquets of the kind desired. These may measure 2, 3, or more feet in length, and are usually fitted into a wire cornucopia covered with a paper or satin holder.

TENNIS COURT: *Tweedside.* Asphalt or York paving-stone is as good as anything you can employ. The court should have a kerb of thick granite at the front, and the floor should be carefully laid or made.

TOMATOS: *H. L., Ree.* The too-well-known Tomato-spot. Burn the plants, and spray the foliage of the healthy plants with weak Bordeaux-mixture. Not a week passes but we have to give this information, and the disease has been frequently figured.

TURNING A SEMI-DOUBLE BEGONIA FLOWER INTO A PERFECTLY DOUBLE ONE: *R. J. L.* You might increase the size of the flower by rich feeding, but not necessarily add to the number of its petals.

VINE BORDER: *J. D.* Dig out the staple if unsuitable for Vines 2½ feet deep, and to begin with make a 5-feet-wide border; lay in drains of broken stone in V-shaped cuttings 12 feet apart and 4 feet deep, also an outfall drain at the furthest limit of the border when fully made up, giving this drain a fall of 1 in 12. Cover the rubble drains with sods, then fill in the 5-feet space with good pasture loam, roughly chopped, crushed bones about one-sixteenth of the whole, charcoal about the same, lime-rubble one-eighth, but no manure. When settled, plant the Vines in the dormant state, or when growing in April or May.

COMMUNICATIONS RECEIVED.—*St. V. D., Singapore*—*D. C. T. D.*—*Dr. Charlton Bastian*—*E. Sandford*—*W. D. H.* (next week; no charge is made for such advice)—*Grange*—*M. Buysman*—*A. J. B.*—*J. B.*—*F. Mason Good*—*R. W. C.* (photographs)—*T. B. M.*, *Ashville, N. Carolina*—*Prof. Tschirch, Berne*—*W. S.*, *Laucaster*—*W. B.*, *Ramsgate*.—*C. E. B. W.*—*G. B.*—*J. J. W.*—*N. E. B.*—*W. R. DIED.—*Mr. G. C. BINNIE*, suddenly of heart-disease, at the age of thirty-eight years, at Langley House, Aberdeen, at which place he was head gardener.

GARDENING APPOINTMENTS.

MR. CHARLES FOSTER, Gardener at Henham Hall, Wangford, Suffolk, has been appointed Instructor in Horticulture at University College, Reading. His new duties will commence on September 1.

MR. H. J. GILLARD, formerly second Gardener at The Grange, Sutton, as Head Gardener at the Royal Naval College, Osborne, Isle of Wight. He commenced his duties on June 22.

MR. JAMES GRANT, for the past two years Gardener at Linwood Hall, Leven, Fifeshire, as Head Gardener to *C. NICHOLSON, Esq.*, Sawley Hall, Ripon, Yorkshire. He enters upon his duties on August 1.

MR. MARK HUNTLEY, for the past four and a half years General Foreman in the gardens at Normanswood, Farnham, Surrey, as Head Gardener to *Lady MURIEL PAGET*, Dover House, North Crays, Kent, and commences his duties on September 28.

MR. WM. JAS. PENTON, for six years Head Gardener and Orchid Grower at Bowden Hill, Chippenham, as Head Gardener and Instructor at Studley Castle, in connection with *Lady WARWICK'S* Hostel, now removing from Reading, and commences his duties on August 1.

Continued Increase in the Circulation of the
"GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, more than*

OLD-WORLD NAMES OF PLANTS.

A LATE number contains an article on the British names of Ferns so interesting that one feels diffident about hinting at mistakes, as some at least of these are not due to the writer, but are common to all who have lately written on the subject. All the same, it is a pity they should continue to be perpetrated, however unwittingly. One common mistake is that which assigns its distinctive appellation to the female or Lady Fern because its fronds are not so coarse as those of *Lastrea filix-mas*, the common Male Fern, the female Fern in this instance being *Athyrium filix-femina*. The name as applied to this species is comparatively of modern date, and is one of those unhappy transferences of the botanist that inevitably lead to confusion. The true female Fern of all the old authorities was the common Bracken, *Pteris aquilina*. While the latter still retained its proper and ancient English name, we find *Lastrea filix-mas* reduced to the position of a Polypode—*Polypodium filix-mas*; the *Athyrium* at the same time being *P. filix-femina*, or the "female Polypody," this, not improbably, the thin edge of the wedge that rent the name from its rightful owner. Of course, it is not a very important matter, but the fact remains that only two plants were recognised as (what shall I say?) true Ferns, or, as an Elizabethan writer puts it, "This herbe is of two sorts, male and female." There is a vast accumulation of interesting lore connected with both, their "virtues" being somewhat similar, and even their names being interchangeable, the wounded Scottish hero of Otterbourne, according to the Scots version of the ballad, being laid under the shelter of a "bracken bush," which was

clearly the Male Fern. The Gaelic for both Ferns is also the same word. And not improbably *Athyrium filix-femina* and *Lastrea dilatata* would be confounded with *L. filix-mas*. Both species conferred invisibility on that individual who was fortunate enough to catch the seed during the one moment it was in existence on St. John's Eve; but the female was generally the one that enabled people who "had the receipt of Fern-seed to walk invisible." The unfolding young fronds of the male were known as St. John's, and also Lucky Hands.

The other mistake is that in connection with "Maidenhair." Turner rightly calls "*Adiantum*" Venus-hair, but it was not known in England till found in the eighteenth century in Glamorganshire. The correct meaning of both names can be traced to the peculiar quality possessed by the hair of the Goddess of Love, being unsusceptible to wet; and to the foliage of *Adiantum capillus Veneris* having a like property. The comparison of the stalks to the hair of a woman is quite modern, as in no instance do we find an old writer ever refer to the stalks, but invariably to the hair-like roots. As happens, however, in the case of so many old names, it is impossible to discuss here or to further allude to the sense in which they used the expression "maiden-hair." Culpeper discovered the origin of the name from the fact that a hair-wash was produced from the plant that was at once effectual in "staying hair from falling out," and also as a stimulant to growth! The chief use of the plant, however, was derived from its supposed efficacy as a pectoral. On account of its curative properties, the doctors and herborists were obliged to look about for a substitute, and discovered one in *Asplenium Trichomanes*, the common Maidenhair; but the following species were also employed: *A. adiantum*, *nigrum*, which is the Oak-fern, though the common Polypody, and *Polypodium Phegopteris*, and *P. Dryopteris* have also carried that name. *Asplenium Ruta-muraria*, the *Adiantum album*, or White Maidenhair, also Sage of Life, and Tent-wort, from its employment in wounds, was equally valuable. *A. Trichomanes*, it ought to be said, was the red Maidenhair, to distinguish it from the black and from the white.

According to Turner, Galium was called in the North, Maidenhair. This Britten identifies with Galium Aparine; but as "petie Muguet" is given as an equivalent, it is plain that is a mistake. The old Muguet—"Mugwet" Gerard calls it—was the common Woodruff, and Petti-mugget as an English name was bestowed, and no doubt rightly, on Galium verum. The name Maidenhair was also applied to a moss, *Polytrichum commune*, "*Polytrichum*," as well as "*Trichomanes*," at one period being the official name of the common Maidenhair, and hence doubtless the reason this plant bears it. Ground Ivy and Clematis vitalba also possess a right to the name, while *Briza media* is the Fernegrass, or Maidenhair Grass.

These do not exhaust the list, as *Asplenium marinum*, *A. septentrionale*, and *A. viride*, which is the "green" Maidenhair, are other Ferns associated with the name. It is rather disappointing that no reference is made to *Ceterach officinarum* in the article already referred to, the more so as

Spleenworts are discussed, and the above is the true Spleenwort or Milt-waste, pronounced in the North "Melt," spleen and milt being synonymous. Turner and Gerard knew it as *Asplenium*, the former giving as its English equivalent "Citterach, or Scale-fern, or Finger-ferne." As everybody knows, it is a plant one cannot pick up every day, therefore other Ferns, including the male and female, *A. Lonchitis*, *Blechnum spicant*, and others were used as substitutes. "Scale," as applied to the plant, will be obvious to anyone examining the underside of the fronds; and if we are to credit Lightfoot, it was called Finger-fern on account of the fronds being equal in length to a finger.

Ophioglossum vulgatum and *Botrychium Lunaria* are so interesting that a few lines may be spared to discuss their popular names and properties. The former was known in Scotland as Ane-blade, and we also find it called Serpent's-tongue, Adder's-grass, Adder's-spear, and Christ's-spear. A vulnerary ointment called "Green Oil of Charity," described by Gerard, was still in use a hundred years ago, and like the Moonwort, it was a plant of great repute among witches. The Moonwort, according to Bacon, was used by these misguided females in the composition of an ointment with which they anointed their bodies. Bacon calls it Moonshade. It was also employed as a vulnerary. Culpeper and other writers ascribed a curious property to this Fern, that of loosening the shoes off any horse that happened to tread on it with its feet; on that account, he says, country people called it Unshoe-the-Horse. It was also invaluable on occasions when it was desired to enter lock-fast places without a key, the herb having also the property of unlocking doors. If it had removed the locks altogether, as it extracted nails from a horse's foot, that would have been sufficiently wonderful, but the faculty of shooting back a bolt is very wonderful indeed. A modern writer contends that this is the "Martagon," but Turner plainly declares that plant to be *Listera ovata*.

The above is merely a selection of names and properties applicable to Ferns, and I shall conclude by noting that two common plants, *Myrrhis odorata* and common Chervil, were often called Sweet Ferns. *R. P. Brotherston.*

NEW OR NOTEWORTHY PLANTS.

CALODENDRON CAPENSE, THUBG.

THIS tree has been cultivated at La Mortola without a name, as it had never flowered and nobody was able to recognise it. Perhaps in consequence of the very abundant rainfall during last June, or perhaps owing to the fact that the plant does not flower before reaching a certain age, its flowers have not previously been seen here. At present the tree is bearing its extremely pretty flowers on the ends of its branches. From these it was easily recognised as *Calodendron capense*, Thubg., the "Wilde Castanie," or wild Horse-Chestnut of the colonist at the Cape.

There is no figure of it in the *Botanical Magazine*, and that in Nicholson's excellent *Dictionary* does not do justice to the graceful flowers. The structure of these flowers is very curious. The petals are white and reflexed, the outer wall of the stamens is petaloid. They are white or pale rose coloured, with many carmine tubercles.

The flowers are very delicate and do not last long when cut.

I believe there is no other tree of this species of the same size in the whole Riviera. *Atwin Berger, La Mortola.*

[A fine illustration of this tree was given in the *Gardeners' Chronicle*, vol. xix., n.s., 1883, p. 217. Ed.]

A NEW KIND OF CUCUMBER.

At the meeting of the Royal Horticultural Society on July 21 last, a Cucumber was shown by Hobbies, Ltd., nurserymen, Dereham, under the name of Lemon-Cucumber (fig. 26). The fruits were between 3 and 4 ins. in length, and 2 ins. in the lesser diameter; of a pale yellow colour, although immature, and having a texture of flesh and a flavour identical with the ordinary Cucumber. There are numerous small, creamy-white, very early out-of-doors Cucumbers cultivated in Russia, Khiva, and Poland which in some particulars resemble the variety figured; and the French and Dutch gardeners cultivate several of the white-skinned Cucumbers in the open ground, including the one used largely by perfumers, *Bonneuil Large White.*

STRAWBERRIES IN 1903.

The stools did not pass through the winter as well as usual. The foliage suffered from the sharp November frost and the cold, cutting winds, and probably also from being rather too moist at the root. However, the new foliage came along strongly, and the rains of April and early May gave hope of a fine crop; but the frosts of May retarded the growth at the end of the month, and even in June they made but little headway.

As is well known, in many districts the partly-developed trusses of blossom were greatly injured by the unusually severe spring frosts; but though our Strawberry fields lay high and fully exposed, the damage was not perceptible.

By June 2, some of the king flowers had set; but so cold and unkindly was the rest of the month that they only became fit to pick by June 26. A fine dry and warm time then set in, and the crop, after all its vicissitudes, has been both larger and finer than usual.

Royal Sovereign was quite the first to ripen, and the quality was as good as we ever had of this very useful all-round variety, which, as the *Gardeners' Chronicle* says truly, has so completely become indispensable as to cause some of the older kinds to be neglected.

Probably from the causes named a few sterling sorts were not up to their usual standard.

Vicomtesse de Thury was later, and the fruits very small, but still possessing that rich and distinct flavour which is its characteristic.

President—the gardener's favourite for mid-season supply—was deficient in crop, but good in quality; and its "relative," *Kitley's Goliath*, did not crop over its usual long season. And an old variety—a favourite in this district—*Trollope's Victoria*, was wanting in quantity.

The way in which Strawberries vary in different localities makes it impossible to prophesy whether they will succeed in any particular place; and one constantly hears the praises of varieties which have, years back, been discarded in these nurseries, where 200 kinds have been tested. For these reasons one does not like to condemn any new varieties on a first year's trial. But your readers will doubtless look for some remarks on the recent novelties.

The *Laxton*, planted from pots, 1902, grew strongly, and came ripe three to four days after *Royal Sovereign*, in beds but 8 feet distant. The *Laxton* berries were large and of a fine deep colour; but neither in flavour, texture, nor crop did they reach our expectations. The *Laxton* must have a further trial before we can speak

FIG. 26.—NEW CUCUMBER.

decidedly of its value. It, however, appears to us to have qualities that may command attention as a market berry; and it would be interesting to hear of other growers' experience.

Climax produced very large woolly berries, too soft to travel, and the flavour is here not good; it may improve.

Fillbasket produces a great quantity of smallish berries, but is not equal to older kinds. I, however, hear of large late crops in market culture.

FIG. 27.—STRAWBERRY PRESIDENT LOUBET.

The *Khedive* did not take kindly to our soil, and the fruit was small; it may, however, be, like others, better on a two years' stool. So far, it does not come near *Queen of Denmark* as a prolific bearer of the same mulberry colour. This latter variety is one of our standard late kinds.

Givon's Late Prolific, on the other hand, has proved itself worthy of the First-class Certificate awarded. The stools are hardy, with bold foliage, which shelters the very large and handsome cockscombed or three-sided berries, which are of first-class flavour and have very small seeds. It is the finest of the late kinds, and produces a good succession of fruits.

Trafalgar has given some very handsome bright scarlet fruits; but the crop is a light one, and it is not in point of flavour equal to *President*.

The finest berries and the heaviest crop of any variety has been *Louis Gauthier*; and we are yet gathering good berries. This is a berry all should grow for home use. Its flavour is good, and may be best described as refreshing rather than rich; but as a contrast alone it is worth a place. The gatherings from *Gauthier* have been double that of any other kind.

Filbert Pine has been most excellent, and its flavour grand. As a late mid-season kind it has no equal.

The dwarf-growing *Frogmore Prolific* has been very fine in berry, and the crop has been respectable. It never bears heavily, but its superior flavour makes it indispensable.

The Countess has again been the third best for quality.

Doctor Hogg is still the best and sweetest, and *British Queen* is No. 2. When we can get this latter race with the crop of *Royal Sovereign*, we shall have no more to wish for.

That bright and free-bearing sort, *Sir Charles Napier*, has done better than usual, but it is a preserving kind and not up to dessert quality.

Other little known but fine berries are *Walluff* and *Dumbarton Castle*. These produce a heavy crop of very large berries, which ripen and finish within fourteen days.

Latest-of-All has given us fine berries, but the flavour varies greatly; one day it is first-class, and another only second-rate. It evidently requires very high culture, which it does not get in our field-growth.

Waterloo, *Elton Pine*, and *Eleanor* are still three good useful late kinds.

Grosse Sucrée, *Auguste Nicaise*, and *Edouard Lefort* are only Strawberries for forcing; but *Royal Sovereign* is so fine that they are going out of use.

We should say, however, that the white (or pink) *Louis Gauthier* is very fine for forcing, and has rich sweet flavour.

Mentmore with us is no advance on *Noble*.

Sir Joseph Paxton has been remarkable this year for crop and continuance in bearing, and yet remains the market berry for profit.

The rains of June 17 and 19 have been grand for the young runners. *George Bunyard, Royal Nurseries, Maidstone.*

STRAWBERRY PRESIDENT LOUBET.

The above-named new variety has as its parents *Waterloo* and *Sir Charles Napier*, wrongly given as *Lord Napier* in our report of the meeting of the Royal Horticultural Society. The fruit (fig. 27) is showy, dark-coloured like *Waterloo* from which in that respect it scarcely differs, and of more than average size. It was exhibited by Messrs. J. Veitch & Sons, Ltd., Royal Exotic Nursery, King's Road, Chelsea. The variety is to be tried at the Royal Horticultural Society's gardens, Chiswick.

FIG. 28.—RIBES SPECIOSUM: FLOWERS DEEP CRIMSON.

RIBES SPECIOSUM.

THIS, perhaps the finest of the species belonging to the Gooseberry section of the genus Ribes, is frequently looked upon as a plant which, if not actually demanding wall-protection, requires at all events a very sheltered position. Such conditions are not always necessary for it, however, in proof of which I may say that in the end of last month I found two healthy plants growing in an exposed position in an open border in Messrs. Dicksons & Co.'s nurseries at Craigmillar, Edinburgh, which were literally covered with flowers, as the accompanying photograph of a branch taken from one of them shows (fig. 28). The plants, which have occupied the same position for several years, are exposed to practically all the points of the compass, but notwithstanding this they are growing vigorously, and are at present sending up strong shoots from the base.

The species, which is a native of California, is a very striking one. The flowers, which are of a deep-crimson colour, and similar in form to those of a small-flowered Fuchsia, are produced all along the branches of the previous year, from which they depend singly or in twos or threes; and the foliage, which is of a deep-green colour, is similar to that of the common Gooseberry. The plant deserves more attention than is generally bestowed upon it; and if it were tried on high, dry situations would probably give good results, even although the exposure might be somewhat severe. *A. D. Richardson, Edinburgh.*

MARKET GARDENING.

THE COLOURING OF BLACK HAMBURGH GRAPES.

CALLING on the gardener at Manresa House lately, to see the large Vine there, I was delighted to find such fine bunches, well coloured, and in every way so creditable to the son of the late Mr. M. Davis. In order to obtain such alluring colour and density of bloom on the berries, the special requirements of the variety must receive due attention, and a vinery must be devoted to the Vine.

I am led to make this statement on seeing large consignments of Black Hamburgh of the worst possible colour now being sent to Covent Garden Market. The sender and grower is successful with the varieties Black Alicante and Gros Colmar under apparently similar conditions to the Black Hamburgh Grapes, with the exception that the first two have a longer rest, the vinery being empty of pot-plants for a much longer period of time. The Black Hamburgh Vines, on the contrary, do not get the necessary attention, the

result being lack of colour. Market cultivators, finding that one crop taken from a glasshouse is not sufficiently remunerative unless it is of first-rate quality and weight, make use of vineries for other things in pots.

At present prices Grapes of inferior quality sell at 6d. per lb., whilst better produce sells at 1s. 6d. to 2s. per lb. It should, however, be remembered that the cultivator of the cheaper Black Hamburgh Grapes must have space in which to grow his plants, especially as he has to grow twice as many of the latter as was the case ten years ago to get the same returns. The fruit of the Black Hamburgh will not put on the best colour unless the Vine be treated according to its needs, whereas the Black Alicante colours more readily.

Anent this matter I may mention that I called recently on Mr. F. E. Sparkes, West Court Nurseries, Worthing, and noticed the lack of finish and colour in the fag-end of a crop of

Grapes; he was very emphatic as to the cause namely, that a number of Richardias had been kept in the vineries for too long a period of time. Not only do these plants require much water at the roots as to make them unsuitable for placing in vineries of Black Hamburgh whilst the fruit is colouring, but ventilation has to be curtailed, and the exhalations and dampness arising from the Richardias during the night are inimical to good colouring. Nor are the borders so sweet as they should be, or the Vine-roots so free and healthy near the surface as would have been the case had Richardias not been kept in the vineries. Mr. Sparkes will not follow this practice in the future. *Stephen Castle.*

[The evil effects on Grapes of growing other kinds of plants in vineries after the fruit has begun to colour have been known for many years to professional gardeners, who generally abstain from the practice if the glasshouse accommodation provided admits of it being done; but market cultivators are often lamentably ignorant of special knowledge of the business in which they embark, hence the appropriateness and value of our correspondent's remarks. Ed.]

BEGONIA MARIE BOUCHETT.

AMONG the plants that received an Award of Merit at the Royal Horticultural Society's meeting on July 21 last was a variety of fibrous-rooted Begonia. It is reminiscent of *B. boliviensis* in the arrangement of the stamens, which are disposed in long spikes and not in tufts, and which have become petals, giving the flower the appearance of a bright-coloured rosette. It is a suitable plant for placing in a basket or covering a wall space in a warm-house, having strong growths of 4 feet in length.

The plant was from the gardens of W. Greenwell, Esq., Marden Park, Woldingham (gr., Mr. Lintott).

FIG. 29.—BEGONIA MARIE BOUCHETT: FLOWERS RED.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP; AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

** FULLER COMMENTS WILL BE GIVEN IN THE FOLLOWING NUMBERS. SEE ALSO LEADING ARTICLE ON PAGE 78.

as it may be with truth, that botanical names are often so little fixed in their application that confusion may and does arise from the application of many different names to the same plant, it may be replied that, to a botanist with records and herbaria at his command, these diversities can be adjusted at the expense of comparison and research, whilst in the case of popular names there is no authoritative standard whatever. *Alphitonia excelsa*, t. 6, affords a good illustration of what we have just written. The Latin name is duly recorded, and the book in which it was described indicated so that there is no difficulty in finding it; but when we turn to the vernacular names, we find such names as "Red Ash" (of course it is not an Ash, and botanically quite unlike one); "Leather Jacket," "Cooper's Wood," and "Humbug," the last a not inappropriate epithet for a vernacular name. If these vernacular names are not approved of, we may, if we like, fall back on the native names, and make our choice between "Murrung," "Nono Gwyinandie," "Culgera-Culgera," "Mee-a-Mee," and "Co raminga." For our own part we do not see that either the popular or the aboriginal names, which cannot be verified, are any better than the much-abused botanical name, for which chapter and verse can be cited, whilst the plant itself may be found duly labelled in the herbarium all ready for comparative study. The other plates are devoted to *Doryphora Sassafra*s and *Alstonia constricta*, which has valuable medicinal qualities, possessing the properties of both quinine and strychnine. The third part of this publication contains illustrations and descriptions of *Cedrela australis*, *Eucalyptus resinifera*, and *Cryptocarya obovata*. Full details are given of the uses of these trees for economic purposes. The vernacular names are again singularly unfortunate, for the *Cedrela* is no Cedar, nor anything like one; the *Eucalyptus* is no Mahogany, and the *Cryptocarya* is totally different from a Beech. The *Cedrela* furnishes the most valuable timber in the colony, being used for the same purposes as Mahogany; *Eucalyptus resinifera* is also one of the most valuable hard woods of the colony. The *Cryptocarya*, though called the Beech, is really a Laurel in its affinities.

THE LARGEST MAP.—Growing on six acres of a gentle southern slope of Tesson Hill, at the Louisiana Purchase Exposition, St. Louis, is to be the largest geographically correct map ever constructed. The map is 480 feet long from east to west, and extends from north to south 240 feet. The map is to be the main feature of the large open-air exhibit by the Bureau of Plant Industry of the Department of Agriculture, and is personally superintended by D. A. BRODIE. The idea is to show the United States with growing crops planted as per the natural distribution. The several acres were fenced off early in April, and the entire tract was richly fertilised. The ground was ploughed and harrowed, the soil pulverised, and the entire tract sowed with Cow Peas. This crop not only enriches the soil but prevents the growth of weeds. When an exhibit is ready to be installed the gardeners simply pull up the Cow Peas covering the space required, for the ground then requires but little work. A belt

of blue grass lawn 20 feet wide establishes the boundary and coast lines of this gigantic map. The boundary lines between the States are marked by cinder paths 3 feet wide. That part comprising the fourteen States and territories of the Louisiana Purchase is marked by a white gravel walk. Not only will the products of each State be shown on this map by growing crops, but the section of the State on which each commodity is most grown will be shown. *The Weekly Florists' Review*.

"THE FOREST FLORA OF NEW SOUTH WALES."—The second and third parts of this important publication are before us. The trees figured are *Eucalyptus longifolia* of Link, t. 5. "Botanical names should," says Mr. MAIDEN, "be used for timber trees (and all other plants) wherever possible. Confusion in names of timbers leads to trade disputes and uncertainties, and accusations of bad faith in many ways." If it be alleged,

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR AUGUST.

SATURDAY, AUG. 1	{ Société Française d'Horticulture de Londres Meeting.
MONDAY, AUG. 3	{ Bank Holiday. Sheffield Floral and Horticultural Society's Show. Headington Horticultural Society's Show.
TUESDAY, AUG. 4	{ Royal Horticultural Society's Committee Meetings. Lecture on "Landscape Gardening."
WEDNESDAY, AUG. 5	{ Mortimer Horticultural Society's Show.
SATURDAY, AUG. 8	{ Royal Botanical Society's Meeting.
MONDAY, AUG. 10	{ Royal Botanical Society's Annual Meeting.
TUESDAY, AUG. 11	—Half-Quarter Day.
WEDNESDAY, AUG. 12	{ Bishop's Stortford Horticultural Society's Show.
THURSDAY, AUG. 13	{ Taunton Dean Horticultural and Floral Society's Exhibition.
TUESDAY, AUG. 18	{ Royal Horticultural Society's Committee Meetings. Lecture on "Hollyhocks."
WEDNESDAY, AUG. 19	{ Shropshire Horticultural Society's Exhibition at Shrewsbury (2 days). Eastbourne Summer Show.
THURSDAY, AUG. 20	{ Royal Agricultural and Horticultural Society of Jersey, Exhibition (2 days).
FRIDAY, AUG. 21	{ Devon and Exeter Horticultural Society's Show. Strathearn Horticultural Show (2 days).
TUESDAY, AUG. 25	{ Royal Oxfordshire Horticultural Society's Show. Brighton and Sussex Horticultural Society's Show (2 days).
WEDNESDAY, AUG. 26	{ Royal Botanical Society's Meeting. Harpenden Horticultural Society's Show. Bath Horticultural Society's Show (2 days). Reading Horticultural Society's Show.
THURSDAY, AUG. 27	{ Sandy and District Floral and Horticultural Society's Show. Irish Gardeners' Association's Meeting.

SALES FOR THE WEEK.

FRIDAY, AUGUST 7—
Orchids in Flower and Bud, Lillium Harrisii, and Kentia Belmoreana Seeds, at Messrs. Protheroe & Morris' Central Sale Rooms, 67 & 68, Cheapside, E.C.
(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—63.2°.

ACTUAL TEMPERATURES:—

LONDON.—July 29 (6 P.M.): Max. 67°; Min. 55°.

July 30 (Noon): Showery, thundery; 66°.

PROVINCES.—July 29 (6 P.M.): Max. 59°, Eastern Counties; Min. 52°, Shetland.

The Fruit Crops.

NEVER since we have made a practice of recording the condition of the fruit crops, a period of nearly forty years, have we had occasion to present so disastrous a record. From John o' Groats to the Land's End, from Galway to East Anglia, the tale is the same. With the exception of Strawberries and small fruit, the words "total failure" best express the condition of affairs. Our correspondents from all the counties of the British Isles are mostly old friends who have rendered us the same service year after year, know our requirements, and are to be thoroughly depended upon from old experience to give as accurate comparative details as circumstances permit. We refer our readers to the Summary on p. 77, which we have appended to the tables, which gives in a concise form the main results.

Taking Apples as the most important crop, and the one most generally grown, we find out of a total of 267 records for the whole of the British Isles, only two make mention of a crop above average, against 248 reported to be under average.

In Scotland there are 7 places which have furnished an average crop as against 5 in England (3 in Surrey and 2 in Kent); so that Scotland has a little, a very little, the best of it.

As to Pears, one average crop only is recorded from the English counties—viz., from Crawley, in Sussex.

A solitary average crop of Plums is noted, and that from Newark, in Nottinghamshire, as against 176 under average.

But it is useless to prolong the agony. Our Summary tells its own tale.

Nor, if we seek the causes of this wholesale deficiency, are the facts any more consolatory. From April 8 to 25 there were from 12° to 17° of frost in various places; and this long-continued frost was all but universal throughout the country, though, of course, not of equal severity in all places.

The effects of these April frosts were accentuated in many places by subsequent visitations in May and June. But whilst there is no doubt as to the main causes of the disaster, it is pointed out by some of our correspondents, notably by Mr. BUNYARD, that the sharp frosts which occurred in the previous November had their effect upon the wood of the trees imperfectly ripened by reason of the sunless autumn. Mr. BUNYARD has most fruit upon trees moved in 1901 and 1902, which consequently made but little growth, and that very "hard."

The word "under" occurred so often in our tables that we began to fear that the resources of the printing-office might be strained to produce a supply of the requisite letters, but happily that contingency did not arise. It must be remembered too that the word "under" does not fully represent the state of affairs, for in many cases entered as "under average," there was no crop at all!

Now what are we to do? Can we, in fact, do anything to obviate the effects of such a visitation? The planting of late-flowering varieties would obviously only meet the case very imperfectly, neither is shelter always obtainable. We have heard it suggested that we should put an import duty on Apples from America and Strawberries from France, but that seems to be an Iberian method of increasing our supplies of fruit. It would deprive the public of their

fruit, and would not assist the home grower who has none to sell. All we can do is to recommend the fruit-grower not to put all his eggs into one basket, but to multiply his resources, increase his efforts, improve his system of cultivation wherever possible, and hope for the best.

The Fruit Industry for Cottagers, etc.

WE fear that it may seem something of a mockery to speak of "Packing and Selling Fruit and Vegetables" in a season like this, where over large areas of this island there is no fruit to pack. Still, the deficiency is not quite universal, and we can bear personal testimony to the fact that Strawberries, at any rate, have yielded an abundant crop, even though the earlier blooms were injured. Moreover, such seasons as the present are happily exceptional, and the lessons inculcated by Mr. LEWIS CASTLE in the little book whose title is above quoted are, perhaps, of even greater importance when supplies are scanty than they are when they are abundant, on the principle that it is wise to make the best of what we have got and make up in enhanced prices for deficiencies in quantity.

Early in the year 1902 the Worshipful Company of Fruiterers, desiring to assist small cultivators in improving their methods of dealing with garden-produce, offered a gold medal and twenty-five guineas for the best essay on "Gathering, Packing, and Profitably Disposing of Home-grown Fruit and Vegetables." The prize was gained by Mr. LEWIS CASTLE, the Superintendent of the Duke of BEDFORD's Experimental Fruit Farm at Ridgmont, and the essay itself is now published at a low price by Messrs. W. H. and L. COLLINGRIDGE, of Aldersgate Street.

The book opens with an account of the allotment system as carried out by the wise liberality of many landlords. The holders of these allotments are conveniently classified by the author as first cottage gardeners, men in regular work, who should not attempt to cultivate more land than they can do thoroughly and creditably without over-burdening themselves; second, allotment gardeners, comprising men not in regular employ elsewhere, who can therefore devote more time to their gardens, and can manage, say, an acre of good land with advantage; third, small market gardeners, a comprehensive term intended to comprise occupiers of small holdings of from 5 to 20 acres in extent. To these also the advice is given not to take more land at starting than can be well managed by the holder and his family, without any extra labour.

Cultural details are only incidentally treated in this essay, but the excellent advice is given to cultivate the crops, whatever they may be, as perfectly as possible, for while superior samples can always find a market, indifferent or low-class produce is very often either quite unsaleable or is only disposed of at a price which yields no return for the labour expended. These practical details, though only touched on incidentally, are excellent, the author constantly dealing with the requirements of the markets rather than with absolute excellence.

The question of packages for fruit and vegetables, especially those of whatever material which can be constructed by the cottager himself, is one of great importance. Among

these, special mention is made of wicker-baskets, and of the desirability of growing Osiers for their construction. The golden and the cane Osier, both varieties of *Salix viminalis*, are recommended, as well as the "Old black," a form of *S. triandra*, and a number of other kinds which we have not space to mention. Of packing material Mr. CASTLE speaks, among others, of cotton-wool; but that we consider is a substance not to be recommended for the purpose, at least, it should not be allowed to come into contact with the fruit. Good white wood-wool of Willow or Poplar is much better.

Very useful hints are given as to gathering fruits. As ordinarily practised by the cottager, this is simply fruit slaughter. Bruising not only disfigures the fruit and spoils its value for market, but it favours the growth of moulds and ensures the speedy decay of the fruit.

The selection and grading of fruits are matters about which our average home growers are still woefully behind their continental and American competitors, as we have ample opportunities of seeing. "There are many obstacles," writes Mr. CASTLE, "in the road to business success in fruit and vegetable growing, that cannot readily be removed, but here is one absolutely in the power of the producer to deal with, indeed, it is chiefly of his own production." Genius is sometimes defined as the capacity for taking pains. If that be so, it is only a small proportion of those who send to market who can claim to be geniuses. Many of the complaints that reach us as to the alleged iniquities of middlemen, when examined into, resolve themselves, in the first instance, to a want of attention to details and a happy-go-lucky instead of systematic methods of procedure. The various methods of selling the produce are treated in a separate chapter, and the grower would do well not only to study that, but to make himself acquainted with the Dutch co-operative system, as described in our columns, December 13, 1902, p. 438, and in a "leaflet" issued by the Board of Agriculture.

We cannot devote more space to Mr. CASTLE'S essay, but it is so full of useful information and common sense, the outcome of experience and observation, that we are not surprised that it secured the approbation of the judges. It has a good index and numerous illustrations; but unfortunately no scale of magnitude is given, so that some of the cuts may prove misleading. We trust it may have a wide circulation among the classes for whom it was written.

NARCISSUS MRS. GEO. BARR (Supplementary Illustration).—The new variety figured in our supplement this week was shown by Messrs. BABB & SONS at the Drill Hall on Tuesday, April 21 of the present year, receiving an Award of Merit. It is of the Ajax section, flowers pure white, of fine form and substance, and slightly drooping. This fine flower is not quite so large as the grand Peter Barr. The plant was shown also at the Midland Daffodil Society's show, April 16, 1903. Our figure was prepared from a photograph taken by Mr. A. R. GOODWIN, "The Elms," Kidderminster, and may be of interest now that the planting season is near at hand.

ROYAL HORTICULTURAL SOCIETY.—In order to celebrate the jubilee of the establishment of a business in London (Mr. JAMES VEITCH, junior,

having come to Chelsea in 1853), Messrs. JAMES VEITCH & SONS, Ltd., have presented to the Royal Horticultural Society five Silver-gilt Cups of the value of 50 guineas each. This liberal offer has been accepted by the Council, and the following conditions drawn up:—The Cup will be known as "the Veitchian Cup," and one will be awarded once a year to the best individual exhibit, in the opinion of special judges, at the Temple Shows of 1904, 1905, 1906, 1907, and 1908, or at any other leading show held under the direction of the Society that the Council may determine. The successful exhibit may be either a single plant or a group, a novelty or an example of culture. The Cup will become the property of the winner each year, but he will be required to make a declaration that the exhibit is his own property, and has been cultivated by him for fourteen days previous to the show. The judges are to be seven—three amateurs, two gardeners, and two nurserymen or seedsmen—to be selected by the Council. No exhibitor can win more than one Cup.

— **EXHIBITION OF EDIBLE FUNGI.**—On Tuesday, September 15, the Royal Horticultural Society will hold an Educational Exhibition of Edible Fungi in the Drill Hall of the London Scottish Volunteers, Buckingham Gate, Victoria Street, Westminster; and a lecture upon them will be given by Dr. M. C. COOKE, M.A., V.M.H., &c., at 3 P.M. All interested in extending or acquiring the knowledge of the edible species are invited to send collections. Collections should (if sent) be delivered at the Drill Hall on Monday afternoon, September 14; or if brought, should arrive at or before 9 A.M. on the Tuesday, so that they may be properly grouped and arranged by the Fungus specialists. Collections should consist of any Fungi supposed to be edible. Each specimen should be wrapped separately in thin or tissue-paper, and packed so as not to get loose or shaken in transit. When the names are known by the senders they should be neatly written on card and enclosed, but if not known they will be named by the experts. The Society will pay the carriage of all collections, and will award medals according to merit. The best collection will be considered to be that which includes the largest number of edible species shown in the best condition. When the senders are doubtful as to whether any of the specimens are edible or not, the matter will be determined by the experts. Unnamed collections will also be examined, named, and sorted into edible and poisonous by the experts as far as their time will permit. All specimens will be destroyed at the close of the meeting unless removed by the senders. Intimation of an intention to exhibit should, if possible, be sent a few days before to the Secretary, Royal Horticultural Society's office, 117, Victoria Street, London, S.W.

— The next meeting of the Fruit and Vegetable and Floral Committees of the Royal Horticultural Society will be held on Tuesday, August 4, in the Drill Hall, Buckingham Gate, Westminster, 1 to 5 P.M. Special prizes will be given for Cactaceous plants. A lecture on "Landscape Gardening" will be given by Mr. H. E. MILNER, V.M.H., at 3 o'clock.

— At a General Meeting of the Society held on Tuesday, July 21, thirty-six new Fellows were elected, among them being Lady ARTHUR HILL, Lady MARGARET CECIL, Sir PHILIP MAGNUS, and the Hon. GERALD PONSONBY, making a total of 1,045 elected since January 1 last.

ABBOTSBURY.—We learn that Mr. BENBOW, of Abbotsbury Castle Gardens, has been appointed gardener to Sir THOMAS HANBURY, at La Mortola, Ventimiglia. The gardens at Abbotsbury are noted for their collections of rare and interesting plants. *Eucalyptus coccifera* and *E. globulus* have been raised from home-grown seed, the seedlings being now 10 feet high. The Olive,

Olea europæa, is established, *O. excelsa* also raised from seed. Seedling Bamboos are 2 feet in height. *Acacia dealbata*, raised eight years ago, are now trees flowering every year; the flowering branches are cut for decorative purposes as early as February. *Arundinaria Simoni*, as at many places in the country, is flowering. Mr. BENBOW has experience of the Riviera climate, as he was gardener for a time at Cannes, and also at the Château de Barla, Nice. Mr. BENBOW was also formerly at Victoria Park, London; Eastwell Park, Kent; the Royal Gardens, Kew; and Firle Park, Sussex; so that his knowledge of gardening matters is extensive and varied. We wish him every success in his new undertaking.

THE GERMAN TARIFF.—It is stated that the importation of Apples into Germany in barrels or other packages is henceforth to be forbidden. In this way Canadian, American, and Tasmanian Apples would be shut out.

GHENT.—The final act of the great Quinquennial was carried out on June 29. On that day the zealous and genial President was the recipient of an address from his colleagues, in which they testified to the warm feelings they entertained for him, and gave a tangible illustration of their regard for him by presenting him with a superb vase and a photograph showing the members of the Society assembled on the steps of the Casino. Those of our countrymen who were present at the Quinquennial will feel how thoroughly well earned was this mark of respect and affection.

AN AMERICAN EXPERIMENT STATION.—The work done at the scores of experiment stations in the United States is illustrated by what is done at Amherst, Massachusetts, under the direction of our correspondent, Prof. VAUGH. There are trained professors whose daily business is special investigation in the various departments of agriculture and horticulture. The work is done on a scale of sufficient magnitude to present the subject in all practical ways, and the products are large enough to ensure of keeping in prompt touch with the market quotations. There the cultivator finds the meat of the nut cracked for him; there he can find the best Apples, Pears, Peaches, Plums, and small fruits of all kinds. The directing professor can give lists of the most profitable varieties for the market or for family use. Is there not here a hint as to what should be done at Chiswick?

MR. WALTER OATES is leaving the service of Sir THOMAS HANBURY, at Ventimiglia, where he has been head gardener for the past four years. Mr. OATES was trained in good English and Continental gardens, and speaks German, French, and Italian. He is desirous of obtaining a situation in some English Colony, and from his age, character, and attainments, should have little difficulty in securing what he is in search of.

"BEAUTIFUL AND RARE TREES AND PLANTS."—Messrs. GEORGE NEWNES, Ltd., announce that they have in preparation for publication a work under the above title by the Earl ANNESLEY which will commend itself to every owner of a park and to every lover of a garden. There will be about seventy plates, reproductions of original photographs. We have on many occasions been privileged to lay before our readers illustrations of rare trees and shrubs from his lordship's gardens at Castlewellan, so that we can readily imagine the beauty and interest of the proposed work. The edition will be limited to 300 copies, and subscribers will be supplied in the order of application.

THE MOSQUITO PLANT.—Sir WILLIAM THISELTON-DYER sends to the *Times* a long letter from Dr. PROUT, the Principal Medical Officer, Sierra Leone, detailing the numerous experiments

made by him and Dr. Hood to put to the test the alleged powers of the mosquito plant, *Ocimum viride*.

The conclusions may be briefly summarised as follows:—

“1. Growing plants have little or no effect in driving away mosquitos, and are not to be relied on as a substitute for the mosquito net.

2. Fresh basil leaves have no prejudicial effect on mosquitos when placed in close contact with them.

3. The fumes of burnt basil leaves have a stupefying and eventually a destructive effect on mosquitos; but to obtain this action a degree of saturation of the air is necessary, which renders it impossible for the individual to remain in the room. It is probable, however, that cones made of powdered basil would, when burnt, have the effect of driving mosquitos away, and to this extent might be found useful.”

The fumes of insect powder (*Pyrethrum*), and of nicotin “XL-All,” are efficacious in making the rooms in which they are burnt too uncomfortable for gnats and flies; but the discomfort is equally great to human beings, and by the time the rooms were habitable the insects or their relatives might return, unless mosquito-nets were used over the verandahs, &c.

PURPLE - LEAVED TOMATOS.—Some time since we received leaves of Tomatos in which the substance of the leaf was coloured a rich bluish-purple. The colour was confined to the cellular tissue, leaving the veins greenish-yellow. The leaf-stalks were also devoid of colour. It was clear, then, that the colour was not due to absorption of an aniline dye. Microscopic examination showed that the coloration was not due to the action of iodine on starch. Mr. L. A. BOODLE has now kindly examined the leaves for us, and finds that the blue colour becomes reddish-purple when soaked in dilute acetic acid, but the original colour is restored on the addition of ammonia. It is probable, therefore, that the coloration is due to the formation of anthocyanin, which occurs so frequently in variegated leaves. Be this as it may, the difficulty remains of accounting for the fact that only one or two plants out of a houseful grown under the same conditions have put on this coloration.

DAFFODILS.—The Rev. J. E. BOURNE has contributed to the series of *Hand-books of Practical Gardening* published by Mr. JOHN LANE and edited by Mr. HARRY ROBERTS, a little treatise on “The Cultivation of the Daffodil.” Mr. BOURNE adopts Mr. BAKER’s classification, which was very practical and easily grasped by the novice, but which successive hybridisers have done what they could to invalidate. A new classification, then, will soon be needed, and one founded on the relative size and form of the perianth-tube will probably be found more “natural” and scarcely less convenient than the existing one. Mr. BOURNE gives us descriptive lists and much information not before available in so convenient a form. His illustrations are defective as conveying no idea of proportionate size. The history of the Daffodil “cult” affords an excellent illustration of the way in which the increase and the diffusion of knowledge tend to the benefit of plant-lovers, of botanists, and of commercial men. What do we not owe in these particulars to PETER BARR? Largely to his energy and zeal, which have become infectious, our gardens have been enriched with unthought-of beauties—beauties within the reach of those of scanty or moderate means; botanical knowledge has been largely added to, both from a classificatory and from a physiological point of view, whilst the florists’ shops and the catalogues which reach us are sufficient to show how great has been the development of trade industry connected with the Daffodil. But it is to the cultural details that

the readers of this little volume will naturally turn with eagerness. They will not be disappointed. Mr. BOURNE lays down some excellent principles, which will apply also to most other plants. Everything, he says, should be done thoroughly, at the right time. The plant should be put into suitable surroundings. Forethought and preparation in advance are requisite, and a careful system of labelling adopted. These are excellent rules, and the author follows them up with equally sensible directions as to soil and other factors in the “environment.” Early planting is insisted on if the best results are to be secured, and a change of soil is considered highly beneficial, though the plants do not get that under natural circumstances, a fact that shows that it does not do to copy Nature too slavishly, but to adapt our procedures to differences of conditions. The gardener wants a good display every year, but the botanist knows that the Daffodils are much finer and more abundant in some years than in others, and he knows the reason why. A list of certificated varieties and a good index complete a book which in its thoughtful execution must earn for itself a high place in garden literature.

UNIVERSITY COLLEGE, READING.—New buildings will shortly be erected, for which the sum of £80,000 is required. Of this amount £30,000 has already been contributed by five donors, including £10,000 given by Mr. G. W. PALMER, M.P., and £10,000 by Lady WANTAGE. The late Lord WANTAGE was President of the College from 1896 to 1901.

SWEET CHESTNUT WOOD FOR TANNIN.—It may be news to some to learn that in Basta, Corsica, there are already three factories for the manufacture of tannin from the bark of the Sweet Chestnut—a fourth being now in process of building. It appears that the article made usually in France is much less valuable than the Corsican, which is stated to be of a better colour, and better adapted for sole leather.

MEMORIAL TO THE LATE PROFESSOR ALLEYNE NICHOLSON.—An interesting meeting was held in the Natural History Class-room, Aberdeen University, on Friday, 24th inst., for the purpose of handing over to the University authorities a beautiful bronze tablet, spontaneously subscribed for by friends, colleagues, and students of the late Dr. ALLEYNE NICHOLSON, Professor of Natural History in Aberdeen University. It is a fine work of art, and in design and execution neat and appropriate. The design was furnished by Miss WOODWARD, daughter of Dr. HENRY WOODWARD, London (late of the British Museum), and has been made with the view of emphasising, in strikingly appropriate and artistic form, the special features in which the late Dr. NICHOLSON excelled, and in which he acquired considerable fame. Thus, for instance, down the sides of the panel are seen entwined, in acanthus style, a group of grapholites, in the study of which the late professor did valuable work; and at the foot ancient fossil corals form, by repetition, a very effective ornament; while trilobites as effectively enter into the design, together with clam shells. At the top there is a topographical representation of the Crossfield Hills, in the north of England, a district Dr. NICHOLSON knew well, having been born at Penrith. A representation of the setting sun shedding its rays over the scene is suggestive of the peaceful close of the Professor’s life, with “twilight and evening star, and after that the dark.” Over this representation of the Crossfield Hills there is the appropriate motto—“*Levavi oculos meos in montes,*” of which the most familiar interpretation is, “I to the hills have lifted mine eyes.” A representation of the Professor’s head and shoulders, in profile, occupies a prominent position on the tablet. The strong

features are well delineated, and the high forehead and bushy beard give to the head a striking appearance. At the side spaces are the name and degrees:—

“HENRY ALLEYNE NICHOLSON, M.D., D.Sc., F.R.S.,”
and an inscription below as follows:—

BORN AT PENRITH, SEPTEMBER, 1844.

DIED AT ABERDEEN, JANUARY, 1899.

PROFESSOR OF NATURAL HISTORY—

TORONTO, 1871; DURHAM, 1874;

ST. ANDREWS, 1875; ABERDEEN, 1882—99.

SWINEY LECTURER, 1877—1896.

A SKILLED GEOLOGIST, AN UNTIRING

INVESTIGATOR,

EMINENT AS A TEACHER, BELOVED AS A FRIEND.

The tablet, though somewhat larger, will form a companion bronze to the one erected in 1900 to the memory of the late Professor MACGILLIVRAY, whose work is also fittingly commemorated in the design. Principal MARSHALL LANG presided at the ceremony, which was largely attended.

KINGSTOWN PAVILION, DUBLIN.—In connection with a new Winter Garden and Concert Hall lately opened, Messrs. SHEPPARD, of Rathgar, have laid out a terrace-garden, which forms a most attractive feature. The entrance to the gardens is at the corner opposite the railway station, and from this a broad drive 30 feet wide has been made to the Pavilion, and immediately around the Pavilion, a promenade over 20 feet wide has been constructed. From this promenade two flights of brickwork steps have been made, one flight with a very easy incline, the other rather steeper. These steps lead to another broad promenade, 4 feet higher than the Pavilion. In the terrace slope, between these spaces, a portion is planted with creeping plants. From this promenade broad walks lead to the different portions of the grounds. A dripping pool has been formed by using stones from Rathgar Quarries, built in strata, so as to imitate the natural rock, and over a portion of these water falls into a pool beneath. The whole has a very natural appearance. In and around the rocks of the pool, large pockets and borders have been made and appropriately planted. All the walks and paths are made with easy gradients, and are well drained. Borders have been formed all round the boundaries, and planted with trees and shrubs on the massing system. All the ground between the walks and paths have been laid out in an undulating manner, and clumps of trees formed, so that in the course of two or three years they will give complete seclusion and privacy. All the works on Victoria Beach were designed and laid-out by the Messrs. SHEPPARD, and also the borders adjacent to and the trees on the Queen’s Road were all completed under their supervision. Mr. SHEPPARD, senior, has devoted the greater part of his life to landscape gardening, and there is hardly a county in Ireland in which he has not carried out works. In the present work he has been ably assisted by his son. The Pavilion was opened by the Countess of LONGFORD, who planted a Holly as a memorial of the occasion.

THE NATIONAL ROSE SHOW.—There is a strong feeling in some quarters that the Metropolitan Show, is, on the average, fixed too early in the year. The consequence of this is that the Northern and Midland growers have not a fair chance. At the Metropolitan exhibition is held the friendly contest for the championship of the year. When this is held, Roses should be at their best. Can it be maintained that Roses are at the best between July 1 and 4? Yet it is on these dates that the Metropolitan show has been held six times during the last seven years, and

only twice, it is asserted, has the show been a good one, whilst the Northern show, which is generally held about July 15—19, has been invariably good. There is a good deal to be said on both sides, and we trust our rosarian friends will favour their colleagues with their opinions on the subject in order that the members may have an opportunity of discussing it prior to the annual meeting.

IRELAND.

A GARDEN IN WICKLOW, MOUNT USHER.

THE county of Wicklow is so far like the county of Kent in England as to be popularly known as the "Garden of Ireland." There are few, if any, Hops grown there except for ornament, but of "Cherries and fair women" there is no lack, as the quaint old-world chroniclers used to say. It is a genial land of dell and glade, of rich pastures and fertile arable, of forest, bog, and woodlands. It contains beautiful glens and mountains, such as Djouce, the loftiest (2,384 ft.), and the great Sugar-Loaf (1,651 ft.), which latter is by far the most picturesque and popular of all the peaks of Wicklow. This mountain is well wooded at its base, clothed with two species of Gorse and Furze, and three species of Heather, beloved of the bees; and so is very lovely as seen in either the spring or in the autumn months of the year. The upper portion has been denuded, and its top is composed of loose débris, which, lying at about the angle of repose, gives to it at times, when cloud-capped, a remarkable likeness to the slopes of the great sacred mountain, Fusi-yan, of Japan, a similarity that is also intensified when its summit is snow-capped in the winter season. Wicklow is remarkable for its luxuriant wild Gean or Cherry-trees, snow-white in spring, and crimson and gold in autumn, as the leaves change colour before their fall. At Killincarrig, near Greystones, just across the golf-ground, is one of the finest orchards of cultivated Cherries in Ireland, and to walk under its flowery branches in spring, just as the tender green tassels are on the Larch, and to get glimpses here and there of the great blue cone against scurrying white clouds, is a delightful sensation, not alone to author, poet, and painter, but to "the man in the street" as well. Probably, however, the latter may appreciate the orchard at Killincarrig when Strawberries ripen, or when the Cherries are ripe later on in the garden year.

Mount Usher is situated in the happy valley of the Vartry river, which supplies the city of Dublin with water, and enlivens and beautifies every inch of the country it passes through. It is two miles from the village of Ashford (another reminder of fair Kent), and is reached by rail from Harcourt Street station, passing through Bray, and near to Wicklow, before one alights at the nearest station, which is Rathnew. The whole journey is a glorious panorama of exquisite scenery, the sea on one hand, and the rich alluvial plains and marshy land on the other, backed by rising woodlands and blue-topped mountains and hills. Some miles past Greystones and Kilcool stretch the shingly sand and reedy lagoons, on what is called the "murrrough" of Wicklow, rich in winter with sea-birds and other wild fowl, and in summer rich in wild flowers and grassy herbage. It is a beautiful route to a garden that has become a promised land, an Eden of the West, or say a Mecca to which flock garden-loving pilgrims of high and low degree. It is not a public or show garden, and should not be entered in an unceremonious way or manner. It is really and truly sacred ground, rich in memories of many and diverse kinds. Old people have lived there, and died there also. Young folk have played on or beside the sparkling river as it dances or tumbles from rock to rock, or falls over the little weirs—fair children, now happy mothers, or lying at

rest beneath the flowery sod of other lands. Originally there was a stately old house called Mount Usher, in what is now the Rossannagh demesne; the old site of the garden is discernible, and on the grassy plat beside the river below a fine avenue of standard or clear-trunked Yew-trees still remain. Rossannagh House itself, the Wicklow seat of the Tighe family, is close by, and it was here that Mrs. Mary Tighe (born, 1773—died, 1810) wrote the once popular poem called "Psyche," the subject of which was

The garden at Mount Usher has been pictured and described many times, and still the most expert of horticulturists who are privileged to go there leave it with regret and with sensations resembling those of the rustic fiddler who by chance heard the playing of Paganini; or those of the Queen of Sheba when she said farewell to Solomon in all his glory.

Originally the cottage (some portions of which still remain) was a mill and kiln, and less than twenty years ago I saw the ruined old mill-wheel

FIG. 30.—RIVERSIDE PATH IN THE GARDENS AT MOUNT USHER, CO. WICKLOW.

taken from the well-known story of Apuleius. Near the brick mansion is a fine old Yew-tree with inarched or anastomosing branches, and in the adjacent grass field are fine Scots Firs and a Sweet or Spanish Chestnut, having an enormous trunk, which is said to be the largest specimen in Ireland. On a steep slope, quite close to the entrance gate to the Mount Usher of to-day, stands a noble-trunked Scots Fir, that would be difficult to match elsewhere—though Wicklow generally has long been celebrated for its fine trees.

in position, and its axle and mill-stones are probably there still under the refectories or guest-chamber overhead. This accounts for the little mill-pool near the door, and for the little streams or races that rush and sparkle and tumble through the rocky banks, the hardy Fern-glade, or that flow beneath the grey and mossy stones of the flower-laden boundary walls. As we have before indicated, the Vartry river itself (fig. 30), as of old, flows through the midst of the garden. It is next to impossible to unlyse and describe the peace and quiet and the manifold

variety and luxuriance of the place, and there are but few other places in Ireland where so great a variety of vegetation as is grown here reaches to such a high and healthy standard of perfection. The place is the reverse of pretentious, it is not very large in area, and it has for the past thirty years or so grown rather than "laid out" or made. Perhaps this is one of its greatest charms. Thousands of plants have been experimented upon and lovingly watched and admired, or studied, moved, and nourished until the right soils, places, and conditions of aspect, light, shade, and moisture have eventually been found. When we speak of "the garden at Mount Usher," some qualification is necessary, for it rather consists of several gardens, made and furnished or arranged at different times. There is the garden and the pretty cottage on what is almost an island, bounded by races to which the river-side walk here illustrated forms a striking and ever-varying base. *F. W. Burbidge.*

(To be continued.)

HOME CORRESPONDENCE.

AN ANCIENT ROSE-TREE.—In a forecourt garden of a small villa residence at Ealing there can be seen a tree of Tea-rose *Devoniensis* on its own roots, which to the knowledge of the resident is over sixty years old, and which early in July in this year was laden with blossoms, and some of them of excellent quality. *Devoniensis* is, with the exception of Adam, which preceded it by five years, the oldest of the Tea-scented Roses, having been sent out in 1838; so this particular tree at Ealing must have been among the earliest planted. *Devoniensis* was discovered growing in a garden in Devonshire, and may therefore have been a self-sown seedling. It was distributed by Messrs. Lucombe, Pince & Co., of Exeter, in 1838. *R. D.*

POA ANNUA.—I am surprised that Mr. McDonald should have replied to my innocent and complimentary note on p. 43 in such a spirit. To put the matter clearly, his first letter (p. 26) was misleading, and a reflection upon those seedsmen who do supply this grass true to name. Perhaps he wrote hurriedly; in any case there is no doubt both results were unintentional. The editorial paragraph on p. 41 has apparently also been overlooked. The right to use what name he chooses for *Poa pratensis* was not questioned, but I asked why "Kentucky Blue-grass" was selected in preference to the usual English name for a common grass. This has not been answered; and the reference to Wellington and Dumelow's Seedling Apple is not a case in point, as both names have originated in this country and are in frequent use. Your correspondent is mistaken in supposing I wish to act as his tutor—nothing is further from my thoughts; and I had no interests to serve except to assure those who might be concerned that *Poa annua* can be obtained true from some sources if desired. Had he confined himself to his concluding remark on p. 42, to the effect that "grass seeds are being sold as *Poa annua* which are not true to name or description," I should not have written my offending paragraph, for there he is undoubtedly correct; but that does not go nearly so far as his first statement. Should Mr. McDonald be in my district at any time and will favour me with a visit, I will submit to him the evidence upon which my correction was founded. *R. L. Castle.*

—For public parks, I consider this one of the most useful of our native grasses; and Mr. McDonald is quite right in saying that it is difficult to procure, and hardly obtainable as a seedsmen's commodity—a fact which for years I have been well aware of. Probably no other grass can reassert itself so quickly and satisfactorily after being subjected to the tramping incidental to a flower-show, a public fête, or the prancing of cavalry. *O. D. Webster, Regent's Park, July 28, 1903.*

HYBRID OF CAMPANULA WALDSTEINIANA.—Amongst many hybrid *Campanulae*, large and small, which are in my garden, none is more noteworthy than one which I call Stanafeld, because it was sent to me three years ago from Mr. Stansfield's nursery at Southport, where it came spontaneously. One of its parents is certainly *C. Waldsteiniana*, the other I conjecture to be *C. carpatica*. It is not more than 3 inches in the length of the flower-stalk, and flowers so freely as almost to hide the leaves. Three plants which were dots when sent to me have increased to breadths a foot in diameter. The leaf and form of bell resemble those of *C. Waldsteiniana*, but are far larger and more vigorous. *C. Wolley Dod, Edge Hall, Malpas, Cheshire.*

HEAVY RAINFALL AT TORTWORTH COURT.—On the morning of July 22, 2.61 inches of rain was measured at this place; and at two places within a few hundred yards distance there were 2.52 and 2.93 inches measured. *John Banting.*

THE THUNBERGIAS.—These attractive annuals are in danger of becoming lost to gardens. It was with a feeling of delight I came across some plants in pots, suspended in the garden of a country inn; and very pretty they were, healthy and blooming freely. At present, *Thunbergias* are under a cloud of neglect, from which they will emerge some day. *R. D.*

AMELANCHIER BOTRYAPIUM (CANADENSIS) × AND A. SANGUINEA.—These beautiful flowering shrubs have been in great perfection in Lord Aldenham's garden at Elstree, and these trees were the more acceptable seeing that there was little else of the kind in flower at the time. Mr. Beckett told me that he had all the known species of *Amelanchier*. There are great numbers of good things at Aldenham Park, and a little later the garden will be very charming with multitudes of flowering shrubs, aquatics, and some aquatics of which there are all the best and most distinct species and varieties to be found in the ornamental waters. *W. A. Cook.*

BUD VARIATION IN ANNUALS.—I am a constant reader of the *Gardeners' Chronicle*, and I was interested last week in reading the account of Sweet Peas (p. 61), viz., White Sweet Pea flowering along with plants of the variety Miss Willmott. I wish to say that I cultivate *Schizanthus* in variety for conservatory decoration, and I succeed in obtaining fine plants from seed sown in the autumn, and flowered them in 10-inch pots. About one month ago, when taking the plants out of the conservatory, the flowering period being nearly over, I noticed one spray of bloom 2 feet in height, the top half of a rosy-purple colour and the lower half of the spray of the same colour, with a small spray of white flowers in the centre of the main spray. I am unable to send the spray, the flowers having fallen. I have seen nothing like it in any other flower. *Ernest Baguley, Cam-yr-Allyn Gardens, Rossett, Wrexham.*

CONDOR RASPBERRY.—The fruiting trusses of the Raspberry Condor, a cross between Superlative and Red Antwerp, will, I hope, come to hand in good condition. The fruit ripens later than that of Superlative, the growth of the plant is robust, and it is a very heavy bearer. The recent heavy showers have spoilt some of the best trusses, and you will note that the frosts in April slightly injured the fruits at the tip of some of the trusses, as was the case with those of most of the varieties grown here. This variety continues to fruit till the middle of August. *Geo. Pync.* [The fruit has a great resemblance to Red Antwerp in form and colour, and it has a greater degree of acidity, unless the unfavourable weather has hindered the development of sweetness. In our opinion it will make a good culinary or preserving Raspberry, and being a late and continuous bearer, it will fill up the gap now existing between the summer and the autumn-bearing varieties. *Ed.*]

SALE OF LADYBIRDS.—Some little time ago it was stated—in *The Globe*, I think—that a large number of ladybirds had been sent from England [Australia?] to the United States, for placing in

gardens there, in order to deal with insect pests. Now would it not be profitable for cottagers and others in suitable localities to make a trade of rearing ladybirds for sale to English gardeners and growers? I venture to submit that such a trade would be good for all things great and small, save only for the Aphides. *C. B. L. S.*

MELON AND CUCUMBER LEAF-SPOT.—I shall be glad if your correspondent, Mr. S. Castle, will favour the readers of the *Gardeners' Chronicle* by describing methods of cultivation of Cucumbers referred to in "Melon and Cucumber leaf-spot," July 18. I fail to see why second cropping is detrimental to the health of the plants by creating disease, when every precaution is taken with regard to cleanliness, fresh soiling, and rigid adherence to obtaining seed from non-diseased plants, and from firms where disease has no footing. It is noteworthy that many of the successful growers in Kent, whose Cucumber and Melon plants are free from disease, strictly avoid ventilation by affording a thick shading of lime and chalk-wash, and by maintaining a high temperature and genial humid conditions. During the brightest hours of the day the plants are syringed. Under these conditions the plants grow fast, the foliage is of a pleasing dark-green colour, the fruits grow long and straight, and the crops are heavy. Applications of soot-water and blood-manure twice or thrice a week bring fruits of a dark-green colour, and the plants are the picture of health. Many growers have two and even three crops in a season. Water is afforded with a hose during the warmer months, which is a great saving of labour. *C. E. B. W.*

THE CHISWICK TRIALS.—I trust you will permit me to contest the judgment you pass on the trials of vegetables, flowers, &c., at Chiswick, when you say that "commercial houses laugh at them." If that be so, how is it that high-class firms constantly send to Chiswick various products for trial, such as Peas, Potatoes, Beans, Lettuces, Cabbages, or diverse flowers, things which from year to year comprise the trials conducted at Chiswick? Not only do these firms continue to send samples of their best novelties for trial, but they all are most anxious to secure awards at the hands of the respective Committees who have to examine those trials. I can say for the Fruit and Vegetable Committee, which meets at Chiswick several times in the course of the season, that no body of men, all practical and full of the knowledge which gardeners of long experience have as to the garden-requirements of products, could give closer attention to these trials, and deal with them absolutely and solely on their merits. We hear a good deal from time to time as to the excellences of trade trials, all of which are well done, but these are conducted generally in the interests of each firm's own products. At Chiswick no such partiality is evidenced, and it is because the firms who send products there realise that any awards made are made absolutely on any product's merits only, that the traders so anxious to secure for them the stamp of merit from the Royal Horticultural Society. It may be that although the trials, so far as they well can be, are conducted at Chiswick with all possible skill and ability, and are often regarded by the Committee as very satisfactory, are yet not all that can be desired, for the obvious reason that real trials need to be conducted in an open country, where the air is pure and where the soil is not drained of all its natural moisture, as artificial operations have drained that at Chiswick. For my part I do not care how soon Chiswick is abandoned, and I am sure that is the feeling of all those members of the Fruit Committee who go there. It is evident that no description of work which the Society may wish to embark in of a practical kind, including those scientific and experimental tests you seek for, can ever be satisfactorily conducted there. The sooner Chiswick and its wretched student system of labour is abandoned, the better, the moment an area of land, adequate in dimensions, of good quality, and well placed, is provided in the open country. We shall never again have such a chance to found one of the grandest experimental and testing gardens in the world as the now lost Limpsfield site offered. It is in vain to

sigh over a sadly lost opportunity. The misguided Fellows, however, would sink £40,000 in bricks and mortar, and when they have the new Hall they will still be dissatisfied. For £15,000 they might have had a grand garden that would have been a permanent joy. A. D.

THE ROSARY.

LAYERING ROSES.

In addition to the budding of briars, Manetti, and other Rose-stocks now in full swing, the present affords a good time for layering shoots of Roses, a simple and certain method of securing strong plants. Only dwarf plants can be made to serve this purpose, and if well-matured shoots are bent carefully down into a shallow hole made in the soil, a slit an inch long being made on the under side, the shoots secured with hooked pegs, and the soil returned to the hole and made firm, the layers will root during the autumn and spring. J. D. Godwin.

ROSE "ZEPHERINE DROUHIN."

A Dutch correspondent kindly informs us that the Rose mentioned by Mr. Leach is spelt as above, and that it is a Bourbon Rose much used in Holland as a climber, where its beautiful colour is much admired.

In case no one else sends the information, may I say that the Rose your correspondent W. C. Leach describes is probably Zéphirin Drouot, synonym Mme. Gustave Bonnet. It is a hybrid perpetual, and is catalogued by M. Robichon, of Olivet, Orleans, France, as a climbing variety, bright crimson-red. M. L. Williams.

In your last issue, p. 56, Mr. W. C. Leach speaks of the thornless Rose Zephirin Dronan. This name is not correct; that is the reason, I think, that you could not find it in any trade list of Roses. I know the Rose well, having cultivated it myself, and it is, indeed, a very suitable one for a wall or pillar. The name is differently spelt—some spelling it Zéphérine Drouhin, others Z. Doingt or Z. Drouot. If you look in the Catalogue of MM. Ketten Frères, of Luxembourg, you will find it in the Bourbon section under the former name, and that it was sent out by Bizot in 1868. This Rose is cultivated in great quantities in Orleans, France, and sells very well. E. B. [We shall be glad to know what is the correct way of spelling the name. ED.]

THE ROSE SEASON OF 1903.

The venerable Dean of Rochester has expressed the opinion that this has been the most unfavourable season for Roses that has been experienced during the last sixty years. In any case they have had difficulties to contend with which have been heroically withstood and even conquered in the case of some varieties; while others of a more delicate and susceptible nature have yielded, through adversity and lack of vitality, to premature decay. This, no doubt, was primarily owing to the lamentable sunlessness of the previous summer, and its consequent impotence to create new, vigorous shoots, or adequately to ripen the flowering wood. It is thus very much with Roses as it is with human beings; their present is moulded by the influence of their past. There must be adequate preparation for the work of the future, in Nature as in life. Like the beneficent plants that grow and blossom around us, ministering unconsciously to our instinct for beauty, we are very largely influenced by our natural environment; the health and inward happiness by which our spirits live are greatly determined by what is generally termed atmospheric conditions. Like them, we must be in perfect correspondence with our environment, or we cease to exist. Can we marvel therefore that an almost human interest is felt by the reverential lover of Nature, by the

botanist and the horticulturist, in the lives and heroic struggles with sternest difficulty of tender plants and flowers? No other art or science with which I am conversant is so creative of sympathy and gentlest patience in the heart and life of man.

During last winter Roses—in Scotland at least—were subject to a fortnight's frost of the most stern and exacting description, greatly intensified in its influence upon vegetation in every form by a desolating east wind. Tea Roses and Noisettes suffered terribly from this most unpropitious atmospheric visitation, and the spirits of ardent rosarians were suddenly reduced to zero for the time. "O what a fall was there, my countrymen!" as Mark Antony (inspired by Shakespeare) says over the dead body of Julius Cæsar. I might have said as much with expressiveness at that period when I witnessed the death of my grandest Gloire. But even then I had an enduring consolation in the form of a magnificent Margaret Dickson (which has proved my finest floral possession this summer) 8 feet high, with

PETER BARR, V.M.H.

the capability of larger growth and luxuriance, since amply realised, to plant in its place.

Chiefly owing to the causes which I have already indicated, such Noisettes and Climbing Teas as William Allen Richardson, L'Idéal, Bouquet d'Or, Madame Pierre Cochet, Lamarque, Maréchal Niel, and Rêve d'Or have hardly yet recovered their normal strength, and in many instances their greatly cherished flowers have not yet appeared.

Up to the present period the finest effects created in my garden have been made by the Hybrid Perpetuals and Hybrid Teas. Clara Watson (the incomparable), Clie, Margaret Dickson (one of the finest garden Roses in existence, and in my opinion the most precious creation of the famous Newtownards rosarians), Papa Gontier (which flowers continuously and most profusely during the summer and autumn), Viscountess Folkestone, La France, Caroline Testout, Mrs. John Lajug, Mrs. Sharman Crawford, Duke of Edinburgh, Enchantress, Crown Prince, and the lustrous A. K. Williams, have during this season produced the most memorable artistic effects. I am not greatly enamoured of Bessie Brown, which has been, I fear, vastly over-estimated; it has not the beauty nor does it open with the facility of Margaret Dickson. In this matter, of course, the experience of other cultivators with a more inspiring climate may be different from my

own; but I cannot say that I greatly admire the formation or arrangement of its central petals, which render it obdurate in the essential direction of floral expansion.

Of new Roses by far the loveliest and largest is Frau Karl Druschki, which I have previously characterised as a German Rose of French extraction with a Russian name. It may possess some of the attributes of its parents, Caroline Testout and Merveille de Lyon; but it most assuredly, alike in exquisite form and in texture (which resembles white satin), surpasses them both. The only varieties that approach it in beauty are Margaret Dickson and Gloire Lyonnaise. But it is a much purer white "Hybrid Perpetual" than either of these, and therefore a supremely precious acquisition. David R. Williamson, *Mansc of Kirkmaiden, Wigtonshire Scotland.*

PETER BARR, V.M.H.

THE Daffodil King by his energy and perseverance succeeded in building up the great nursery and seed business known by his name, whilst his untiring efforts in seeking out and developing the Daffodil formed really only an incident in his career—one that can be paralleled in the case of Lilies, Hellebores, and many other plants. It must not be thought that Mr. Barr's success has been commercial only; he has largely contributed to the scientific knowledge and development of the plants he has cultivated. And then, after a laborious life and at an age when most men seek repose, we find our hero showing himself a "globe-trotter" of the first water. The United States, Canada, Japan, Australia, South Africa—all these countries have been visited in turn and their features observed with keen interest, as is evidenced by the extracts from his correspondence that we have been privileged to publish. Nor has he been content to play the part of tourist, but almost everywhere he has put his great knowledge and experience at the disposal of his colonial friends, and by lectures and shrewd advice he has conferred great benefits on the horticulturists of the countries he has visited. It is evident that such a man cannot rest, and if we hear from him shortly from the cataracts of the Nile we shall not be astonished. So great a benefactor of his fellows will carry with him wherever he goes the warmest good wishes for his health and well-being.

The Week's Work.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLF, Bicton, Budleigh Salterton, Devonshire.

Epiphyllums make a bright display in an intermediate house in October and November, if the plants are well flowered. For this purpose the growths made in early summer must be well ripened by placing the plants in a cool and airy structure, with but little shade during the next two months. *Epiphyllums* are readily injured if too much water be afforded at the root, especially in the autumn and winter. Good plants can be flowered in 6-inch pots, and they show to better advantage when they have a clear stem of 8 or 9 inches, being grafted on the *Pereskia* stock, which may be done in early spring. Cuttings also readily root if inserted in sandy soil containing mortar rubble or broken bricks, loam, and leaf-soil.

Hippeastrums (Amaryllis).—Seedlings raised this year should be kept growing gently; repeat them if necessary, and house them in a warm pit, placing them near to the glass. If allowed to go to rest in the first year the small bulblets deteriorate very quickly. The general stock of older bulbs will need less water at the root, until it is withheld altogether. Afford them all the ventilation and sunlight possible. We stood part of our stock out-of-doors in the third week

of] August last year for six weeks, laying them on their sides during heavy rains. This ripened the bulbs, and the majority flowered well in the spring.

Kalosanthes, now classed as *Rocheas*, are showy subjects, especially the species *coccinea*, with its bright scarlet heads of bloom appearing in July and early August. This plant requires cool treatment throughout the year. Water should be afforded sparingly during the winter months. As the plants pass out of flower, any that are worth growing on for another year may be cut back fairly hard and kept rather dry at the root until growth has commenced, when the ball of roots should be reduced and the plants placed in similar sized pots, or those a trifle larger, placing them in a frame for a month to encourage growth. Cultivate three or four shoots to each plant, in preference to double that number. Cuttings may be inserted now, putting several into a 3 or a 4-inch pot, and transferring them to 6-inch pots when fit, without dividing them. They will make roots readily under a hand-light at the foot of a north wall in soil similar to that recommended for *Epiphyllums*.

Mignonette, for flowering towards Christmas and the New Year, should be sown within the coming week, using 3-inch pots for the purpose. Let the compost be loam, leaf-soil, and a little well-decayed manure, with powdered lime rubble and a sprinkle of sand. Sow the seeds thinly, eventually reserving three to five plants in each pot. Cultivate the plants near to the glass in a cool house or pit. *Machet*, *Bismarck*, and *Miles's Spiral* are suitable varieties for pot culture.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PLOTT, Bart.,
Wexham Park, Slough.

Coleworts.—These Cabbages being much liked during the autumn and winter, every available piece of ground should be planted with them. Before planting the plots let drills be drawn at 1 foot apart and 2 inches deep. Plant at the same distance apart in the rows, and if the weather be dry apply water copiously. *Coleworts* flourish in a rich yet firm soil.

Leeks.—Continue to blanch the stems by placing longer collars of brown-paper round them, as advised in a previous calendar. Earlier plantings which are blanched to the desired height may now be earthed-up. Successional crops should be kept well supplied with water at the root and overhead.

Mushrooms.—The litter from out-of-doors beds should be removed at three-weekly intervals, and some fresh litter added. If the beds are dry afford tepid rain-water through a fine rose-can copiously, occasionally affording farmyard liquid-manure. The Mushroom-house should now be thoroughly cleansed and the walls lime-washed. If woodlice are troublesome pour boiling water into all crevices, and then stop up with cement, &c. Stable-dung and litter may now be prepared for the making of beds, the work being carried on under cover, a shed open at the sides being a suitable place. Let the longest straw be shaken from the litter and the latter laid about 9 inches thick on the floor, and be turned every third day until the rank fumes have passed off and sufficient material is got together for constructing a bed.

Spinach.—Sow a good breadth forthwith, and again a fortnight later, and at the end of the month. Out of these several sowings some are sure to succeed. The well-being of this plant depends so greatly upon the weather that it is never safe to trust to one or even two sowings if a constant winter supply is required. The land should be warmly situated, well manured, and deeply dug, soot and wood-ashes being broadcast over it. Make the ground moderately firm by trampling and raking it before the drills are drawn. Let earlier sowings be thinned to a distance of 4 inches apart, and strew fresh soot along the spaces between the plants in the early morning, and frequently stir the surface with a Dutch hoe.

Turnips.—Frequent sowings should be made up to the end of the month of September, remembering that the later and smaller roots will withstand cold better than the earlier and larger

ones. The recent rains have favoured the growth of the July sowings. Thin young plants as soon as large enough, dress with fresh soot, and keep the hoe constantly among the plants.

Tomatos.—Plants out-of-doors, now growing freely, should be denuded of useless lateral shoots as fast as these appear, and when a sufficient number of fruits is assured on a plant, pinch out the leading shoot. Applications of manure-water and Clay's Fertiliser should be afforded alternately with clear water. If there is any appearance of the fruit splitting, remove them when about half-coloured, and ripen them in a warm and dry place.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury.

Cypripediums.—The plants of *C. insigne*, *C. Spicerianum*, *C. Leeceum*, and *C. Arthurianum*, late autumn and winter flowerers, are growing freely, and they stand in need of abundance of moisture at the root, and humidity in the air of the house in which they are growing. Overhead syringing is especially helpful in keeping thrips in check. If a plant is pot-bound, weak liquid-manure from the cow-stalls may be applied alternately with clear water, taking care that it stands till it is clear and free from sediment, otherwise let it be strained through a piece of fine muslin before making use of it. Weak soot-water may be mixed with the liquid-manure.

Calanthes are growing freely, and should be afforded water copiously at the roots, but with discretion, or "spot" may be set up. Apply weak liquid cow-manure when the pots have become filled with roots, alternating this with plain water. It does good to sprinkle weak liquid-manure on the paths and stages of the house at closing time. When the roots of the plants show at the surface, a thin layer of small lumps of turfy loam or of fresh sphagnum may be laid over them.

Vandas and *Aërides*.—Most of these plants are making roots, and they may, if potted in porous materials, be afforded water abundantly. Avoid a hot, close state of the air in the house at all times, as being conducive to weak and flimsy growth; but let the object be the building-up of strong, leathery leaves, which should be so matured that the plants will safely withstand the inimical influences of our winters. Therefore admit air in reasonable amount at all times of the day, and afford moisture abundantly in the air, together with overhead syringing of the leaves whenever the weather permits.

THE FLOWER GARDEN.

By J. C. TALLACK, Gardener to E. MILLER MUNDY, Esq.,
Shipley Hall, Derby.

Seeds that may be sown.—The seeds of *Anemone coronaria* and allied species should now be sown; and if the seeds have been saved at home, as was advised in a Calendar some weeks ago, they should be mixed, and well rubbed up in sand before being sown, or the plants will germinate in bunches. The sowing is best made in shallow drills in a cool spot. Pansies raised from seeds sown at about this date make strong plants for flowering next year; and these, too, should be sown on a cool soil. Where spring bedding is carried out *Silene pendula* will prove a useful plant for forming beds and edgings. Seeds sown forthwith, and the seedlings transplanted at a few inches apart when ready, the plants grow stocky and strong. *Saponaria calabrica* is scarcely so certain as the foregoing to come through the winter in good condition, but the plant usually succeeds if raised on rather poor soil.

Primroses.—Bunch and other *Primroses* sown in spring may be transplanted when large enough to a north border. I like to let them first get fairly big in the seed boxes, as then if removed with plenty of roots, they do not receive a check upon being transplanted. A small quantity of leaf-soil and road-grit pointed into the surface is helpful.

Bulbs and Tubers.—A grave mistake made very often by gardeners is to purchase at the same season as the bulk of the Tulips, Hyacinths, &c.,

bulbs of such species as *Chionodoxas*, *Scillas*, *Crown Imperials*, *Fritillarias* generally, winter-flowering *Crocuses*, *Colchicums*, *Snow-flakes*, *Erythroniums*, *Cyclamens*, and *Anemones*, which should be planted much earlier. This practice makes the first year's growth weak, with the result that the bulbs or tubers for the ensuing year are small, causing the gardener to imagine that the soil or the surroundings are not such as suit the plants. Nurserymen are difficult to move in the matter of what is to them out of season delivery, consequently the cultivation of such bulbs as are not grown in bulk starts faultily. I have, I think, alluded to this subject before, but it is such an important one that it will bear repetition.

Hellebores.—These plants, as is generally known to gardeners, are impatient of root disturbance, the result of which is almost certain to be the non-production of flowers the following year. Still it is necessary sometimes to lift and divide the plants; and the present affords the most suitable season for carrying out the operation. Great care should be taken to extract the roots intact, for my experience has taught me that a broken *Hellebore* root never heals or breaks again into growth. In dividing a plant, let the rhizome be cut through with a sharp knife, then with two hand-forks pull the plant apart, contriving to keep with each portion some of the strongest of the outside crowns. In replanting do not put manure near the roots, but a little decayed leaf-soil and grit will be helpful in encouraging the formation of roots.

FRUITS UNDER GLASS.

By T. H. C.

Peach and Nectarine trees.—In order that the buds on the early forced Peaches and Nectarines may develop fully, it is of importance that the foliage be kept in a clean, healthy condition until it falls naturally in the autumn. At no period should the soil become dry, and if upon examination it is found to be approaching this state a sufficient quantity of water should be applied to moisten the border to the bottom, with or without liquid-manure as the condition of the trees may indicate. Afford the trees all the air possible, and syringe them daily in fine weather. Trees from which the fruit has just been gathered should have this year's fruiting shoots, as well as all superfluous growths, removed. The trees should be afforded a thorough cleansing with water, and be afterwards treated in the manner advised for the earliest forced trees. Look over the trees bearing ripening fruits, gathering those which are ripe. When the fruits begin to ripen keep the air of the house dry and constantly in movement. Trees of late varieties, if bearing heavily, may need assistance from liquid-manure and copious supplies of water applied at the root. Trees with fruits not coloured may be freely syringed at closing time, and if fireheat be necessary the temperature of the house, together with sunheat, may touch 90°, a warmth of 65° at night being adhered to.

The Orchard-house.—Trees of the Peach, Nectarine, or Cherry, when the fruits have been gathered, may be plunged to the rims in coal-ashes in a sunny position out-of-doors, having previously been cleansed with the garden-engine. Apple, Pear, and Plum-trees grown in pots or planted out as cordons, produce fruit of fine size and quality when properly cultivated and the fruit is thinned. The trees, excepting such as are carrying ripe fruit, may be syringed daily, and afforded water and weak liquid-manure as may be required, in addition to a top dressing of turfy-loam, stable manure, and bone-meal. These top-dressings may be raised above the rims of the pots an inch or two, a cavity being formed round about the stem for holding water; or what is better, put a broad zinc band round the pot just inside the rim. Pinch the lateral shoots, and thus induce the formation of fruit buds and direct the sap to the fruits. If insects appear on the shoots or leaves, use XL-All for green or black-fly, and forcible syringings to keep red-spider in check. Afford air freely always, and in bright weather moisten the paths by day.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq.,
Dropmore, Maidenhead.

Strawberry Plantations—The fruits being finished on early and mid-season varieties, clear away all runners not needed, and weeds, straw, and rubbish generally. Runners which may still be required to be layered should be selected as the work proceeds, and placed temporarily on the cleared spaces between the rows of plants. The plants on stiff soils will be benefited by breaking up the crust of battened soil 2 or 3 inches deep with a fork; but on light soils the Dutch-hoe is the better implement, and in this case a mulch of half-decayed manure should be afforded.

Autumn-fruiting Strawberries.—The flower-trusses now appearing may be allowed to remain on the plants if fruits are looked for during the present and the next month, and a mulch of litter placed in the spaces between the rows and close up to the crowns, as protection to the fruits. Afford water in dry weather, and if specially fine fruits be desired, let the berries be freely thinned.

Raspberries.—Remove the fish-netting from plantations now out of bearing, and the canes that have borne fruit, as well as all weak canes of this season's growth not needed for increase, &c. Doing this will admit more light and air than if all were left to grow together. On light soils, water and manure-water applied at this season will benefit the stools, care being taken, of course, not to apply the latter of too great a strength. The canes of summer-fruiting varieties should be loosely secured to the stakes or wires.

Apples.—Many of the fruits are falling from the trees owing to the presence of the codlin-moth larvæ; these fruits should be collected and burnt forthwith.

Obituary.

ALEXANDER KENNEDY.—In Mr. Alexander Kennedy, who recently died at Pilmuir, Forres, N.B., there has passed away one who was widely known throughout the north of Scotland as an able and successful horticulturist. Born near Inverness seventy-seven years ago, Mr. Kennedy chose as his profession that of gardening. Having served his apprenticeship at Cullen House, Mr. Kennedy spent several years at "show" places in the South, and then returned as Head Gardener to Sir James Grant, Monymusk House, Aberdeenshire. He served in a similar capacity at Strichen House, Durris House (then held by Mr. McTier, a well-known arboriculturist), and afterwards at Brucklay Castle, where he remained for thirty years in charge of both woods and gardens. During the latter period he identified himself closely with the horticultural societies in East Aberdeenshire, where he frequently gave his services as judge. When he retired, some four years ago, to live at Forres, he was made the recipient of a handsome testimonial in recognition of his services to horticulture. At the great shows of the Royal Horticultural Society of Aberdeen, he was a regular attender, and on many occasions acted as judge. Mr. Kennedy was an intense admirer of gardens, woods, and landscapes, and, it should be noted, of the Highlands and Highlanders. Up to the last he was tending the garden he loved so well. Heart failure brought an end as sudden as it was painless.

TRADE NOTICE.

Mr. J. HUGHES, seedsman and florist, 140, High Street, Harborne, Birmingham, for a period of twenty-one years head gardener to the late A. F. Osler, Edgbaston; twenty-nine years secretary to the Birmingham Chrysanthemum exhibitions; founder and for twelve years honorary secretary of the Birmingham Gardeners' Mutual Improvement Association, intends in future to devote special attention to landscape gardening in all its branches.

SOCIETIES.**ROYAL HORTICULTURAL
Scientific Committee.**

JULY 21.—*Present:* Dr. M. T. Masters, F.R.S., in the chair; Messrs. Odell, Hudson, Massee, Saunders, Dr. M. C. Cooke, Prof. Boulger, Rev. G. Henslow, Hon. Sec.; Canon Ellacombe; and Mr. Hunt, visitor from New Zealand.

Verbascum Leaves, diseased.—Dr. COOKE pronounced the fungus to be *Oidium Balsami*. It also attacks Turnips and Strawberries. Powdered sulphur is the only remedy.

Gooseberry Disease.—Dr. COOKE reported on samples sent from Cornwall as being *Microsphaera Grossulariæ*. The application of powdered sulphur is recommended.

Mammillaria with Dodder.—Prof. BOULGER reported that the specimen was attacked by some species of *Cuscuta*. It might have been imported, as hedgerow Caeti about Monte Video are commonly covered with Dodder.

Pollination in Orchards.—Mr. CHITTENDEN, of the County Laboratories, Chelmsford, sent the results of experiments in pollinating Pears and Apples. Of eleven varieties of Pears artificially pollinated (March 3), the flowers being protected by Manilla paper bags, Conference and Durondeau set fruit abundantly; Bellissime d'Hiver and Pitmaston set one out of eighteen and twelve flowers respectively, neither having set fruit last year. Of twenty-three varieties of Apples Gladstone and Stirling Castle were self-fertile, as they also were in 1902; Lord Derby and Schoolmaster, which did not set fruit last year, gave positive results. Of the eleven tried for the first time this year, only King of the Pippins set fruit.

Carnations failing.—Mr. DOUGLAS reported on plants sent from Wetherby by Mrs. Duncome "growing in a dry soil." "There was no disease, but the same result ensues either from too much or from too little water. It occurs when the pot-plants have been neglected, and much rain will then kill the roots. Degenerated plants may be too weak to produce flowers, and they may get into a state similar to those sent. Mortar-rubble, hone-dust, powdered oyster-shells will supply vigour to Carnations."

Papaver dubium, semi-double.—Mr. WILKS showed a small plant, about 5 feet in height, with petaloid stamens. The "doubling" was thus probably due to starvation, a not infrequent cause.

Conference in New Zealand.—Mr. HUNT gave some account of the Conference in New Zealand upon fruit-growing and horticulture; and a discussion followed upon plants of New Zealand desirable for culture in England, in which Canon Ellacombe, Dr. Masters, and others joined.

**HUNTINGDON, GODMANCHESTER,
HARTFORD, AND BRAMPTON
HORTICULTURAL.**

JULY 22.—The first show of the above was held at Hinchbrook Park on the above date, and was a great success. Lord Sandwich, who was in large measure the promoter of the new Society, placed his charming grounds at the disposal of the Committee.

THE QUALITY.

With regard to the show itself there were three divisions:—Cottagers' classes, confined to residents of Huntingdon, Godmanchester, Brampton and Hartford; Amateurs' classes, open to the county; and Open classes; and the splendid number of 761 entries were made by seventy-six exhibitors, 295 Cottagers, 280 Amateurs, and 186 open classes. Most of the classes received a fair number of entries, but in each division Peas attracted the largest number, being twenty-one, twenty-four, and eight respectively in the three divisions. The quality of the exhibits altogether was very good. The groups were particularly good, and Lord Sandwich took 1st and Sir Arthur Marshall 2nd, with two extras in a really fine class. Vegetables were of extraordinary quality, and fruit also was excellent; and Mr. Nutting, one of the judges, said he could not help remarking on the absence of inferior exhibits. The cottagers' exhibits were proportionately in no less degree good.

The successes of Mr. Barson, gr. at Hinchbrook Park, in the Open classes were phenomenal. Entries were made in twenty-nine classes, and he secured no fewer than twenty-five 1sts, two 2nds, and one 3rd, losing in the Sweet Pea class. The Silver Cup given by Miss Willmott, (of Warley Place, Woodford, Essex, for the exhibitor taking the most 1st prizes therefore went to him.

The complimentary exhibits were also much admired. Mr. J. Sewell, gr. to Archdeacon Vesey, showed a

specimen grown from a cutting of the Myrtle used in the wedding bouquet of Her Majesty the Queen, which excited great interest. Messrs. Wood & Ingram (Mr. J. E. Perkins) had a fine display, as had also Messrs. J. Wood Ingram & Son, Messrs. F. M. Bradley, Peterborough; Messrs. W. & J. Brown, Peterborough; and Mr. A. Gifford, Huntingdon.

OPEN.

Six stove or greenhouse plants: 1st, Lord SANDWICH; 2nd, Sir A. W. MARSHALL.

Collection of fruit: 1st, Lord SANDWICH; 2nd, H. GILLIAT. Grapes: 1st, Lord SANDWICH; 2nd, H. C. JONES. Peaches: 1st, Lord SANDWICH, 2nd, Sir A. W. MARSHALL. Nectarines: 1st, Lord DE RAMSEY; 2nd, Sir A. W. MARSHALL.

**REDHILL, REIGATE, AND DISTRICT
GARDENERS'.**

JULY 22.—On the above date, sixty members of this Society visited the gardens of Gunnersbury Park and Gunnersbury House. The party was met at the station, and conducted round Gunnersbury Park, and then partook of refreshment, considerably prepared for them by Leopold de Rothschild, Esq. Gunnersbury House was then visited.

The party then proceeded to the Royal Botanic Gardens, Kew, where the remainder of the day was spent.

BRENTWOOD HORTICULTURAL.

An exhibition of plants and flowers has been held at Brentwood for many years, and it may be regarded as an active horticultural centre. Several tents were filled with produce, and there were several features of more than ordinary interest. One was a pretty exhibition of Roses, some really very good flowers being staged, and the competition took place under the rules of the National Rose Society. The work of judging was somewhat delayed by a storm, which broke over the grounds of Middleton Hall in which the show was held.

The Brentwood and District Silver Challenge Cup, offered for thirty-six distinct varieties of Roses, was won by Messrs. HARKNESS & Co., Hitchin, who had in good form, Alfred Colomb, Charles Lefebvre, Earl of Dufferin, Maréchal Niel, Marie Verdier, Mildred Grant, Marie Baumann, Her Majesty, Dupuy Jamin, Jean Soupert, Bessie Brown, Mrs. J. Laing, &c. Messrs. D. PRIOR & SON, Nurserymen, Colchester, the winners of the Cup last year, were 2nd, they having very good blooms of Prince Arthur, Fisher Holmes, Mrs. J. Laing, Thomas Mills, Helen Keller, Charles Darwin, Mrs. W. J. Grant, &c.; 3rd, Messrs. F. CANT & Co.

With twelve varieties, three blooms of each, Messrs. D. PRIOR & SON took the 1st prize, having in fine character Maman Cochet and its white variety, Duke of Wellington, Fisher Holmes, Mrs. E. Mawley, Tom Wood, Mrs. J. Laing, A. K. Williams, and Alfred Colomb. Messrs. F. CANT & Co. were a good 2nd; they had in excellent character White Maman Cochet, Horace Vernet, Mrs. E. Mawley, Marie Baumann, Bessie Brown, Her Majesty, and Muriel Grahame.

Tea and Noisette Roses were shown in fine character. Messrs. F. CANT & Co. were placed 1st with highly developed blooms of Maman Cochet and its white variety, Muriel Grahame. Mrs. E. Mawley, Comtesse de Nadailiac, Souvenir d'Elise, The Bride, Bridesmaid, &c. Messrs. D. PRIOR & SON were 2nd, they having in excellent character Mrs. E. Mawley, The Bride, Ethel Brownlow, Princess of Wales, Ernest Metz, &c.

AMATEURS.

In the Amateurs' division, the Rev. J. H. PEMBERTON, Havering, was 1st with twenty-four varieties; and Mr. O. G. ORPEN, Colchester, 2nd. Mr. PEMBERTON had in very good form Mrs. J. Laing, Marchioness of Dufferin, Mrs. W. J. Grant, Frau Karl Druschki, Mme. Victor Verdier, Comte Rainbaud, Maman Cochet, Helen Keller, Victor Hugo, &c.

In the class for twelve blooms Mr. ORPEN came 1st, and the Rev. J. H. PEMBERTON 2nd; but Mr. PEMBERTON led again with twelve good blooms of Teas. With four distinct varieties, three blooms of each, the Rev. J. H. PEMBERTON came 1st with Her Majesty, A. K. Williams, white Maman Cochet, and Caroline Testout in fine character; Mr. O. G. ORPEN came 2nd.

With six blooms of one variety, Mr. PEMBERTON came 1st with white Maman Cochet, Mr. ORPEN coming 2nd with the same variety.

In the class for twelve varieties of Roses, in which the Brentwood and District Challenge Cup for amateurs was offered in addition to the 1st prize, the Rev. J. H. PEMBERTON wrested the Cup from the previous holder, Mr. ORPEN, having fine examples of Gustave Piganneau, Frau Karl Druschki, Marie Baumann, Maman Cochet, white do.; Bessie Brown, Madame Hausman, &c.; Mr. ORPEN came 2nd with good blooms of such the same varieties.

A very fine feature was furnished by the two classes for garden Roses, in one of which the trade exhibited

twelve bunches, the 1st prize falling to the lot of Messrs. F. CANT & Co., who had excellent flowers.

In the way of plants there were ornamental groups, the 1st prize in the class for a large one falling to the lot of Mr. PREECE, gr. to Miss WILLMOTT, Warley Place; and Mr. HOLLOWAY was 2nd. The smaller groups had many creditable points. The finest feature in the show consisted in the six very fine exotic Ferns shown by Mr. PREECE; they comprised a gold and also a silver Gymnogramma, Marattia elegans, Davallia fijiensis, and Adiantum fragrantissimum. Mr. H. HOLLOWAY was 2nd; he had a splendid plant of Davallia fijiensis fully 6 feet through—a superb specimen. Gloxinias, Fuchsias, Begonias, Coleus, Streptocarpus, &c., were also shown in good character. Plant culture in the form of well-developed specimens appears to be an art which is in danger of dying out, and the gardener appears to think that what he grows for ordinary house decoration is good enough for a flower show. The cure for this seeming neglect will come when the judges have the courage to withhold prizes from such exhibits on the ground that they show no special excellence of culture.

FRUIT

was somewhat sparingly produced. Mr. PREECE obtained the 1st prize for six dishes having Black Hamburg and Muscat of Alexandria Grapes, Barrington Peaches, River's Orange Nectarine, a Melon, and dish of Figs, a good collection; Mr. W. GREEN, Harold Wood, was 2nd.

Mr. PREECE was 1st with three bunches of White Grapes, having Foster's Seeding. With the same number of bunches of black Grapes, Mr. W. GREEN took the 1st prize with Black Hamburg.

Mr. PREECE was placed 1st with a good dish of Barrington Peaches in the class for six fruits; and in that for a dish of Nectarines, having River's Orange, Strawberries, Cherries, and Gooseberries were also shown, and by amateurs and cottagers as well.

VEGETABLES.

These productions were numerous, and the cottagers made a brave display. The prizes offered by Messrs. Sutton & Sons, Reading, for six dishes of vegetables brought some good collections.

Among miscellaneous exhibits was a large out-door group of hardy variegated shrubs &c., of excellent character, from Mr. JOHN RUSSELL, Nurseryman, Brentwood and Hampstead; Mr. LEONARD BROWN, Seven Arches, Brentwood, had fine Sweet Peas and hardy flowers; Messrs. PAUL & SON, The Old Nurseries, Cheshunt, had bunches of hardy flowers, and Mr. O. CHITTY, Market Place, Romford, Sweet Peas.

Some plants of Warley Scarlet Verbena, an excellent companion to Miss Willmott, was staged by some exhibitor.

SOUTHERN COUNTIES CARNATION.

WITH regard to this important Society, we take the following extracts from the *Hampshire Advertiser and County News*:

Exhibitors were attracted from far and near, one from as far north as Kilmarnock, in Scotland, to the sixth annual show of the Southern Counties Carnation Society, which was held on Friday, July 24, in the Pavilion of the Royal Pier, Southampton. Happily the weather was fine, and the magnificent floral exhibition was inspected with much gratification and delight by a large number of visitors, the display being one of which any Society might well be proud. Undoubtedly the show was the best ever held under the auspices of the Society, and it had considerably more than 250 entries. In addition to the competitive classes, there was a large number of extra exhibits not for competition. The largest in that way was Mr. W. Garton, of Roselands, Woolston, who not only sent a number of very fine Palms, but other plants, which were set out in an attractive manner on the central table.

On entering the pavilion the first object to attract attention was a group of plants very tastefully arranged in the entrance lobby, sent by Messrs. W. H. Rogers & Son, Ltd. Inside the pavilion we noticed a very effective little group, in which Carnations predominated, sent by the courteous honorary secretary, Mr. W. Garton, jun. Alongside was a very fine collection of Sweet Peas, sent by Mr. W. C. Breamore, of Winchester. Messrs. Blackmore & Langdon, of Bath, had a very excellent display of Begonias; while Messrs. Phillips & Taylor, of Bracknell, Berks, had a very pretty stand, on which, the principal attraction consisted of trays of various coloured Water-Lilies. As usual, Messrs. Cutbush & Sons, of Highgate, had a stand of Carnation blooms, not for competition, which were very fine, as were also those shown by Mr. Douglas. Messrs. B. Ladhams, Ltd., Shirley, showed a splendid lot of cut blooms of herbaceous perennials, and Mr. E. Wills, Shirley, had an extensive collection of nursery stock not for competition. Dealing with the competitive classes, not only was the show larger than in past years, but the quality was exceedingly good.

In the smaller classes the exhibits were meritorious, perhaps the best exhibits being in the fancy and

the yellow-grounds. It was a source of satisfaction to notice in such brilliant company that a Southampton amateur, Mr. J. J. Keen, of Avenue Road, was able to figure conspicuously. A very attractive feature in the show was undoubtedly the table decorations with Sweet Peas, there being no fewer than nine tables arranged for the prizes offered by Messrs. B. Ladhams, Ltd. Miss Minnie Snelgrove gained the 1st prize with an admirable arrangement, and also took the premier award for table decoration, having Carnations as the leading feature, which was also a very good exhibit. The Sweet Pea classes were very well filled, and greatly added to the interest of the show.

Appended is the list of awards:—

Carnations—Flakes and Bizarres, twelve blooms, dissimilar.—1st, Mr. F. A. Wellesley, Woking; 2nd, Messrs. Thomson & Co., Birmingham; 3rd, Messrs. Pemberton & Son, Walsall. Six blooms, dissimilar.—1st, Mr. J. Fairlie, Acton; 2nd, Mr. J. J. Keen, Avenue Road, Southampton; 3rd, Mr. D. Walker, Kilmarnock.

White Ground Picotees, twelve blooms.—1st, Messrs. Pemberton & Son; 2nd, Messrs. Thomson & Co.; 3rd, Mr. F. A. Wellesley. Six Picotee Blooms, dissimilar.—1st, Mr. J. Fairlie; 2nd, Mr. J. J. Keen; 3rd, Mr. W. Spencer, jun., Windsor.

Yellow ground Picotees, twelve blooms, dissimilar.—1st, Mr. Martin R. Smith; 2nd, Mr. F. A. Wellesley; 3rd, Messrs. Thomson & Co. Six Blooms, dissimilar.—1st, Mr. J. J. Keen; 2nd, Mr. W. Spencer, jun.; 3rd, Mr. E. H. Buckland, Southgate House, Winchester.

Yellow Grounds and Fancy Carnations (white grounds, self flowers, and yellow-ground Picotees excluded), twelve Carnation Blooms, dissimilar.—1st, Mr. F. Wellesley; 2nd, Mr. Martin R. Smith; 3rd, Mr. E. J. Wootten. Six Carnation Blooms, dissimilar.—1st, Mr. W. H. Parton, jun., King's Heath, Birmingham; 2nd, Mr. W. Spencer, jun.; 3rd, Mr. J. Fairlie.

Selfs, twelve Carnation blooms, dissimilar.—1st, Messrs. Thomson & Co.; 2nd, Mr. Martin R. Smith; 3rd, Mr. F. Wellesley. Six Carnation blooms, dissimilar.—1st, Mr. F. W. Flight; 2nd, Mr. W. H. Parton, jun.; 3rd, Mr. David Walker.

SINGLE BLOOMS.

Carnations.—Bizarres and flakes, scarlet: 1st, and 2nd, Messrs. A. Pemberton & Son, Crimston.—1st, Mr. F. Wellesley; 2nd, Mr. R. Sydenham. Pink.—1st, Messrs. Pemberton & Son; 2nd, Messrs. Thomson & Co. Purple flakes.—1st and 2nd, Mr. F. Wellesley. Scarlet flakes.—1st, Messrs. Pemberton & Son; 2nd, Mr. F. W. Flight. Rose flakes.—1st and 2nd, Messrs. Thomson & Co.

Picotees, red heavy edged.—1st, Mr. J. J. Keen; 2nd, Mr. W. Spencer; 3rd, Mr. F. Wellesley. Purple heavy edged.—1st, and 2nd, Messrs. Pemberton & Son; 3rd, Mr. D. Walker. Rose heavy edged.—1st, Mr. W. Spencer; 2nd, Mr. R. Sydenham; 3rd, Messrs. Thomson & Co. Scarlet heavy edged.—1st and 2nd, Messrs. Thomson & Co; 3rd, Messrs. Pemberton & Son. Red light edged.—1st, Mr. J. J. Keen; 2nd, Mr. S. Hayter; 3rd, Mr. R. Sydenham. Purple light edged.—1st, Mr. W. Spencer; 2nd and 3rd, Mr. F. Wellesley. Rose or Scarlet light edged.—1st, Mr. F. Wellesley; 2nd and 3rd, Mr. J. J. Keen. Yellow ground heavy edged.—1st, Mr. J. J. Keen; 2nd and 3rd, Mr. F. Wellesley. Yellow light edged.—1st, Mr. H. W. Matthias; 2nd, Mr. E. H. Buckland; 3rd and 4th, Mr. R. Smith.

Selfs, any colour.—1st, Mr. E. J. Wootten; 2nd, Mr. F. Wellesley; 3rd, Mr. M. R. Smith.

Fancies (single bloom).—1st, Mr. F. Wellesley; 2nd, Mr. M. R. Smith; 3rd, Mr. W. Spencer.

Premier Carnations.—Bizarre.—Mr. F. Wellesley, with S. Hedderley. Flake.—Messrs. Pemberton and Son with Flamingo. Self.—Mr. W. Spencer, jun., with Sir Boys. Fancy.—Mr. F. A. Wellesley with Charles Martel.

Premier Picotees.—White ground.—Mr. F. A. Wellesley with Fortrose. Yellow ground.—Mr. H. W. Matthias, Thames Ditton, with Pilgrim.

TABLE DECORATION.

Dinner table arrangement of Carnation or Picotee blooms, or both.—1st, Miss N. Snelgrove, 10, Oxford Road, Southampton; 2nd, Mr. R. H. Jeffery, Nursling.

SWEET PEAS.

Nine distinct varieties in bunches of thirty, open (prizes presented by Mr. R. Sydenham, Birmmingham).—1st, large Silver Medal, Mr. A. Maple, Aldermore; 2nd, Silver Medal, Mr. R. H. Jeffery; 3rd, Mr. C. A. Linzee.

Decorated table centre (prizes offered by Messrs. B. Ladhams, Ltd., Shirley).—1st, Miss M. Snelgrove; 2nd, Miss S. E. Burt; 3rd, Mrs. Misselbrook, Atherley Road, North, Southampton.

Nine varieties Sweet Peas in bunches of thirty (prizes presented by Messrs. Toogood and Sons, Southampton).—1st, Toogood Championship Challenge Shield, Mr. H. H. Lees, Grosvenor Road, Portwood; 2nd, Mr. A. Maple; 3rd, Sir Samuel Montagu, Bart., South Stoneham House (gr. T. Hall).

Nine bunches Sweet Peas, distinct (prizes offered by Mr. C. W. Breamore, Winchester).—1st, Mr. F. M. Middleton, Old Alresford; 2nd, Mr. A. Maple; 3rd, Mr. R. H. Jeffery.

HOW PLANTS SCATTER THEIR SEEDS.

(Continued from p. 54.)

IN the Fool's Parsley a layer of the fruit becomes spongy, in the Corn Salad two loculi of the fruit become bladders, in the Strawberry Trefoil and Lady's-Fingers the calyx becomes bladdery in character; these structures thus, in such cases, replacing the "wings."

Another kind of structural contrivance adapted to the wind's agency is that of hairs of various kinds; and these play a wide and useful rôle in effecting the distribution of seeds. They are among the most wonderful and beautiful of the devices which have been sought for by plants to attain the all-important end of seed-distribution.

First and foremost in this category stands the great family of Composites, the largest, richest, and most widely-extended order of plants on the earth, comprising 10,000 species; and doubtless one of the chief factors which have contributed to give the order its great wealth of species is its happy method of seed-distribution. In these plants the seeds are not shed separately, but each is tightly enclosed in a tiny fruit or achene, great numbers of these fruits being produced on the single head, which is commonly styled the "flower," but which in reality consists of very many flowers. The calyx, which is here inserted on the top of the little fruit or achene, is strangely modified into widely radiating, long hairs, toothed, feathery, or silky, as the case may be. The faintest breath of air, when once the tiny fruits are ripe and detached from the flower-head, is enough to waft them upwards and far away through the air, when each looks like a miniature parachute, the small, dark seed-vessel hanging from the widely expanded white pappus of hairs, which may carry it many miles from the parent-plant before it finds lodgment on the ground in a suitable place for the germination of the enclosed seed.

Such structures cross our path on every autumn ramble, blown from the Hawk-weeds, Hawk-bits, Cat's-ears, Sow Thistles, Spear and Corn Thistles, and Dandelions: in the latter plants and in the Goat's-beard they are sometimes united into downy globes. In the beautiful blue Pasque-flower (*Anemone Pulsatilla*), the Traveller's Joy, or Clematis, covering our hedges in some parts of the country during the late summer, and the Mountain Avens, the style or stigma of the fruit develops into a long feathery appendage, greatly adding to the decorative aspect of the plant, and contributing, doubtless, admirably towards scattering wide the small fruits or achenes.

Coming to the Willow herbs, those ornaments of our ditches and river-sides, we observe that their linear capsules, on splitting, liberate great numbers of minute seeds, each provided with a tuft of long, extremely delicate hairs at one end, which serve, as in the case of the fruits of the Composites, to carry it, parachute-like, a great distance through the air. Similar hairs are attached to the seeds of the Willows, but in this case at the base, instead of at the top, their brilliantly-white, woolly seeds, escaping from the two-valved capsule, are well known in the spring. In some common grasses, as the Downy Oat-grass, and the common Reed, as also in the conspicuous and peculiar Cotton-grass of our moors, the long hairs are the agents in the dispersal of their seeds or fruits.

Many plants depend upon a marvellous mechanical contrivance for the wide sowing of their seeds. The seed vessels, at first, in their unripe state, green and sappy, as they gradually dry and ripen, become dark-coloured and hard, losing all their sap, this latter naturally causing them to contract, so that an ever-increasing tension is set up, until finally, on some dry, warm day, the valves of the capsule fly asunder with an elastic spring, often accompanied by a loud report, ejecting the seeds with lightning-like rapidity

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period July 19 to July 25, 1903. Height above sea-level 24 feet.

Remarks.—A week of dull weather, with rain on six days.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 25, is furnished from the Meteorological Office:—

"The weather was at first fair and dry in most districts, but afterwards became wet and unsettled, with thunder-storms or thunder only in several isolated parts of the United Kingdom. Very heavy rain fell in the east and south-east of England on Thursday night, and considerable quantities in some parts of our southern counties on Saturday.

"The temperature was slightly below the mean in all districts excepting Ireland, S., and the Channel Islands. The highest readings which occurred at times varying greatly in different places ranged from 75° in several parts of the Wheat producing districts to 69° in Ireland, N., and the Channel Islands. The lowest readings also varied not only as regards the time of their occurrence, but also with respect to the readings actually recorded, the absolute minima at some stations being as many as 10° or 12° lower than at other stations in the same district. The readings shown in the table, which were nearly all recorded at isolated places ranged from 35° in Scotland, E., and 37° in England, N.E., to 45° in England, S.W., and 52° in the Channel Islands.

"The rainfall was less than the mean in Scotland, but generally in excess of the normal over England and Ireland. In England, S.W., and the Channel Islands, the fall was more than twice, while in England E. and S. it was more than three times the average. The amount collected on Friday morning was as much as 2.3 inches at Cambridge, 2 inches at Shoeburyness, and 1.9 inches at Hastings. At the Royal Observatory Greenwich, 3.2 inches were measured on the same day; while at stations in and around West Ham, the amount varied between 3.2 inches and 4 inches (the records from these places were not used in the preparation of the above summary).

"The bright sunshine was in excess of the mean over Ireland, Scotland, and the north-west of England, but showed a considerable deficiency over the Eastern, Midland, and Southern counties. The percentage of the possible duration ranged from 42 in Scotland, N., and the Channel Islands, and 41 in Scotland, W., to only 26 in England, and the Midland counties."

THE WEATHER IN WEST HERTS.

The present cold and wet period has now lasted over a fortnight, during which there has been only one seasonably warm day, and on four nights readings below 40° were registered by the exposed thermometer. The ground is now at about an average temperature at

2 feet deep, but 2° colder than is seasonable at 1 foot deep. Rain has fallen on all but two of the last twelve days, and to the aggregate depth of 3 inches, which is equivalent to a fall of fourteen gallons on each square yard of surface in my garden. Of that amount eight gallons have already come through the 2½ feet of soil in the bare soil percolation gauge, but less than half-a-gallon through the gauge on which short grass is growing. The latter quantity is, however, the more exceptional of the two, as it is very seldom that any rainwater at all finds its way through that gauge after about the middle of May. On the 23rd rain began falling at 5.30 P.M., and continued without intermission until 7 o'clock on the following morning. For the above 13½ hours the total measurement amounted to nearly an inch. This is a heavy fall for a single day—in fact, a larger quantity for 24 hours has only been recorded here in five of the last eighteen July's. During the past week the sun shone on an average for less than 4 hours a day, or for a shorter period by about 2 hours a day than usual. The winds, although as a rule of only average strength, were higher than in the previous fortnight. The amount of moisture in the air in the middle of the day was about twelve per cent. in excess of the July mean. E. M., Berkhamsted, July 28, 1903.

MARKETS.

COVENT GARDEN, July 30.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. ED.]

sufficient to sting the flesh of anyone standing near. Such phenomena are afforded by the common Yellow Broom, the Bitter Vetch, the Meadow Vetchling, Spurge, &c. In the Bird's-foot Trefoil and one or two others, this bursting apart of the valves is accompanied by a sudden spiral twisting of the latter, which greatly aids to send the seeds flying off. Specially interesting is the Geranium family in this respect; the long beak of the fruit, like the Crane's-bill, from which the plant derives its generic name, is not merely peculiar in appearance, but has its stereotyped use. It consists of five narrow, elongated valves or carpels, each terminating below in a capsule or achene enclosing a seed. As the valves dry more rapidly than the tissue beneath them, they become at length submitted to great tension, so that each becomes finally suddenly detached at the base, the point of least resistance, and the valves remaining still united at the tip of the long beak, each curls suddenly up and outwards like a watch-spring, and the lower swollen part or capsule, which has never been wholly closed along its ventral face, hurls the seed away to a great distance by this beautiful contrivance, the valves eventually assuming the position shown. In some species the lower swollen part of each carpel itself gets hurled away with its enclosed seed.

The splitting open of the valves of the Violet capsule does not liberate the seeds; here the two sides of each hollow carpel gradually approach each other, squeezing the smooth seeds, and by this curious method eventually flicking them all away to a considerable distance.

In one of our rarer wild plants, the Balsam or Touch-Me-Not, an inner layer of the elongated pod becomes turgid and swollen with sap, and thereby submitted to great tension. A slight touch, as from an animal brushing against it, is enough to release this tension, and cause the valves of the fruit suddenly to curl up inwards with lightning-like rapidity, and with such force as to send them, along with the seeds, flying far away.

Some members of the Labiate family, which has been mentioned earlier, have resilient peduncles which, on being pressed downwards by the wind or by any object touching them, say, a passing animal, spring elastically back into their original position. The small fruits lie loosely at the base of the calyx tube, and by this resilient motion of the stalk are ejected from their recess and sent flying through the air, a definite direction to their flight being given either by the calyx teeth at the orifice of the tube, or by a ring of outwardly-directed, convergent stiff hairs between which the seeds are obliged to pass W. C. Worsdell, F.L.S.

(To be continued.)

FLOODS IN THE LEA VALLEY.—Amongst the many sufferers from the recent floods, probably to none has the result been more disastrous than to Mr. F. Scholes and his brother, who occupy some 4½ acres of land near Lea Bridge Station. Owing to the proximity of the local gas-works, the flood-water was charged with ammoniacal liquor and other deleterious refuse, and the destruction of their growing stock, consisting of hardy perennials, &c., is most deplorable, the loss being accentuated by the fact that the seed-beds, from which the land would be planted, have suffered greatly. Dismayed by the trouble by which they have been overtaken, Messrs. Scholes have appealed to me to know if anything can be done to assist them, and, having seen how great is the destruction, I am sending this statement, and would deem it a favour if you would insert it in your journal. I shall be pleased to acknowledge any sums your generous readers may send to me, and will ask a few prominent growers to associate themselves with me in the disposition of the fund. H. B. May, Dyson's Lane Nursery, Upper Edmonton, N.

			Watercress, per dozen bunches.	4	0-6

REMARKS.—Strawberries are practically over for the season, and Cherries will soon follow suit. A few Napoleons, Flemish, and Morellas of fair quality are still coming in. Some Turnips in bags and bushels are now arriving. Valencia Melons in cases of 24 or 36, fetch 12s.; Broad Windsor Beans in bags, at 3s.; English Apples are Early Juliens, Juneating, Keswick Codlin, &c.; Green Walnuts fetch 4s. to 4s. 6d. per sieve. The Oranges quoted are Murcia, 20s. in a box; some Cape Tangerines in trays, 1s. 6d. to 2s. per tray; home-grown Dwarf and Runner Beans are now coming in.

POTATOS.

Home-grown, 5s. to 6s. per cwt. John Bath, 32 & 34, Wellington Street, Covent Garden.

CORN.

AVERAGE PRICES OF BRITISH CORN (per imperial qr.), for the week ending July 25, 1903, and for the corresponding period of 1902, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1902.		1903.		Difference.
	s.	d.	s.	d.	
Wheat	31	5	28	7	- 2 10
Barley	25	0	20	10	- 4 2
Oats	22	8	18	5	- 4 3

FRUITS AND VEGETABLES.

GLASGOW, July 29.—The following are the averages of the prices during the past week:—Apples, Lisbon, 1s. to 12s. per case; Oranges, Naples, 8s. to 10s. per box; Melons, 7s. to 9s. per case; Lemons, 6s. to 10s. per box, and 7s. to 14s. per case; Grapes, English, 1s. 3d. to 2s. 9d. per lb.; do., Scotch, 2s. to 30s. per cwt.; Strawberries, 4d. to 7d. per lb.; Tomatos, 5d. to 8d. do.; Mushrooms, 1s. to 1s. 6d. do.; Onions, 3s. 6d. to 5s. per case; Dutch Barrington Gooseberries, 20s. to 22s. per cwt.

LIVERPOOL, July 29.—Wholesale Vegetable Market.—Potatoes, per cwt., Early Regents, 3s. 6d. to 4s. 6d.; Kidneys, 4s. 6d. to 6s. 6d.; British Queen, 3s. 9d. to 5s.; Turnips, 8d. to 10d. per 12 bunches; Swedes, 3s. to 3s. 6d. per cwt.; Carrots, 8d. to 10d. per 12 bunches; Onions, foreign, 5s. to 6s. per cwt.; Parsley, 4d. to 6d. per dozen bunches; Lettuces, 6d. to 10d. per dozen; Cucumbers, 1s. 6d. to 3s. do.; Cauliflowers, 1s. to 2s. 3d. do.; Cabbages, 6d. to 1s. do.; Peas, 3s. 9d. to 4s. per hamper; Beans 2s. 9d. to 3s. 9d. do. St. John's—Potatoes, new, 1d. per lb.; Asparagus, 2s. to 4s. per 100; Peas, 1s. 6d. per peck; Cucumbers, 3d. to 6d. each; Apricots, 1s. to 1s. 6d. per dozen; Gooseberries, 3d. to 4d. per lb.; Currants, white, 4d. do.; do., Red, 6d.

do.; do., Black, 6d. do.; Peaches, 4d. to 6d. each; Cherries, 6d. to 8d. per lb.; Strawberries, 6d. do.; Grapes, English, 1s. 6d. to 3s. 6d. do.; Pines, foreign, 4s. 6d. to 6s. each; Mushrooms, 1s. per lb. Birkenhead:—Potatoes, 1s. 6d. per peck; do., new, 1d. per lb.; Peas, 10d. to 1s. 6d. per peck; Cucumbers, 2d. to 6d. each; Strawberries, 4d. to 8d. per lb.; Currants, Red, 6d. to 8d. do.; do., Black, 10d. to 1s. do.; do., White, 6d. to 8d. do.; Peaches, 4d. to 6d. each; Cherries, 6d. to 8d. per lb.; Apricots, 1s. to 1s. 6d. per dozen; Gooseberries, 3d. to 4d. per quart; Grapes, English, 2s. to 4s. per lb.; Tomatos, English, 6d. to 8d. do.; Mushrooms, French, 1s. to 1s. 4d. do.; Filberts, 8d. do.

ANSWERS TO CORRESPONDENTS.

BOOKS: *Buds*. The best work we know of is *The Art of Grafting and Budding*, by Chas. Baltet. It was published by W. Robinson, The Garden Office, and doubtless is now out of print, and obtainable only at the old bookstalls.

CARNATION DISEASED: *E. Semper*. Uredo Dianthi, Carnation spot. Burn the affected leaves and spray the plants with liver of sulphur, ½ oz. to 1 gallon of water.

CORRECTION: Mr. Francis Wellesley desires us to correct an error that has crept into our report of last Tuesday's Carnation Show. The 1st prize for twenty-four flakes and bizarres was awarded to him, and not to Mr. Thos. Lord, as stated by our reporter.

CUCUMBER PLANT DISEASED: *J. J. P., Stroud*. The soil sent is healthy and sweet, but we should be chary about using the manure mixed with it. The roots, stem, and most of the foliage were in an apparently healthy condition. Some of the leaves showed traces of Cercospora, a fungus which is spreading fast in this country, and about the life-history of which little is known. Up to the present, fungologists can only advise the destruction of the plants attacked.

GRAPES: *W. S.* The "spot" disease, often mentioned in "Answers to Correspondents." Consult recent issues of the *Gardeners' Chronicle*.

GRUBS IN ROSE-SHOOTS: *W. H. D.* The larvæ of a rather uncommon Sawfly, which when full fed are said to change to the chrysalis stage, in the cut ends of the old shoots. Your best course is to cut off all the infested shoots and burn them; the old shoots should also be carefully examined in the late autumn or winter, and the chrysalids destroyed.

HISTORY OF THE CHRYSANTHEMUM: *F. L.* The history of this plant was given in these pages by Mr. W. B. Hemsley, on p. 521, Nov. 9; p. 555, Nov. 16; p. 585, Nov. 23, and p. 652, December 7, all in 1889; also more recently by Dr. Henry. We are not acquainted with any book giving similar information to that given in these papers.

MADRESFIELD COURT GRAPE CRACKING: *H. D.* About the time of the final swelling the humidity of the air of the vinery should be lessened by affording a considerable amount of ventilation and a little fire-heat, avoiding at that time the application of water to the border, doing this at an earlier date, and affording sufficient to last for a month or two. The variety is not the best for late keeping, owing to its liability to the cracking of the berries.

MELON INJURED: *H. J. K.* The fungus present in the diseased portion of the Melon is not the cause of the decay. An entrance has been gained through a puncture or bruise of the rind caused by some other agent.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*T. W., Hexthorpe*. The Bee Orchis (*Ophrys apifera*).—*Grange*. 1, *Poa maritima*; 2, *Arrhenatherum avenaceum* (starved specimen).—*M. Buysmann's*. The *Potentilla* is probably some form of *P. recta*, but the *Potentillas* of this section are most critical, and we should like to know exactly the home of the plant before expressing an opinion. Unfortunately there is no recent monograph of the genus.—*J. R. Spiræa Douglasi*.—*W. B.* 1, *Lilium croceum* var.; 2, *Geranium pratense*; 3, *Lilium croceum*; 4, *Lilium Henryi*; 5, *Lychnis dioica*, double

flowered.—*C. V. A.* 1, *Abies Clanbrassiliana*; 2, *Cephalotaxus pedunculata fastigiata*; 3, variegated large-leaved Box; 4, variegated Minorca Box, *Buxus balearica*; 5, *Berberis Bealei*; 6, *Escallonia rubra*.—*H. W.* A remarkably fine variety of *Cattleya Mendelii* and *Dendrobium moschatum*.—*W. W. G.* 1, *Santolina incana*; 2, *Lysimachia verticillata*.—*A. C.* Both *Dendrobium formosum*, the difference in the colour of the lip is no botanical distinction.—*Claremont*. *Mormodes pardunum unicolor*, called also *Mormodes pardunum luteum*.—*Z. Q.* A form of *Dendrobium* × *Ainsworthii* (*aureum* × *nobile*).—*P. B., Kent*. 1, *Begonia semperflorens*; 2, *B. subpeltata* var.; 3, *B. incarnata*; 4, *B. nitida alba*; 5, *B. fuchsoides*; 6, *B. argyrostigma*; 7, *Gesnera elongata* of gardens. Several of the *Begonias* have been attacked by insects, and that may have caused the injury complained of.—*L. A.* The numbers were written on thin paper, in pencil, tied tightly, with damp moss all round. Please think of our time. The *Gloxinias* have the mite; spray them with tobacco-water. Tomato-spot; see back numbers of the *Gardeners' Chronicle* almost every week; burn the plants.

1, *Sempervivum tortuosum variegatum*—the green form is illustrated in the *Botanical Magazine*, t. 296; 2, *Primula floribunda*.—*T. D. H.* *Holcus mollis*.

PEACH DECAYING: *B. G.* The stone had split, and as a consequence the fruit had also opened, admitting spores of fungi and setting up decay. See reply to a similar question in a recent issue.

PLANTAIN AND DAISY-COVERED LAWN: *Subscriber*. See reply to "Constant Reader," below.

ROSE-LEAF PERFORATED: *Constant Reader*. The work of the Leaf-cutter Bee, who uses the deleted portion of the leaves to form a lining to its tube-like nests.

ROYAL HORTICULTURAL SOCIETY—HOW TO BECOME A FELLOW: *T. Blackman* and *A. Constant Reader*. If you will apply to the Secretary, Rev. W. Wilks, 117, Victoria Street, Westminster, he will be happy to show you the way.

TO KILL SCALE ON ADIANTUMS AND OTHER FERNS: *Constant Reader*. Try a weak solution of soft-soap at the rate of 2 oz. to a gallon of water, in which ½ pint of tobacco-water is put. Nothing very strong or irritant may be employed.

WASP NEST: *E. S.* Not uncommon.

WEEDY LAWN: *Constant Reader*. Spud up forthwith the roots of Plantains, Dandelions, Thistles, and apply loam and pure lawn-grass seeds in bare spaces, rolling and beating the lawn firm. Apply Watson's lawn sand, or fish manure, or nitrate of soda and super-phosphate of lime. These manures will make the grass grow, and smother the weeds in time; but if the lawn is in a very bad state, it will be better and cheaper to dig it up early in September, after dressing the lawn with rotten stable dung and woodashes, and sow it forthwith with grass seeds and small white Clover. When digging, throw out all deep-rooting weeds. The following mixture of grasses and quantities per acre will be found suitable:—*Cynosurus cristatus* (crested Dog's Tail), 50 lbs.; *Festuca ovina* (Sheep's Fescue), 25 lbs.; *Poa nemoralis* (Wood Meadow Grass), 25 lbs. A small quantity of *Trifolium minus* may be added, say at the rate of 6 lbs. per acre. Clover is of use in protecting the roots of the young grasses, and it dies out in three or four years.

WILD FLOWERS: *Young Gardener*. Do you think it honourable to get us to name the plants which you are going to exhibit at a competitive show, when we cannot do so for the other competitors? We will name them after the show; but you should not send more than six.

COMMUNICATIONS RECEIVED.—*I. K. B., Utrecht*—*A. B., La Mortola*—*H. M., Tonsberg, Norway*—*A. H., Nancy*—*Max L., Baden-Baden*—*W. S., Dublin*—*D. R. W., Dobbie & Co.*—*G. M., L. B., J. H. P., J. B., R. I. L.*—*A. Mem.* and *C. W. K.* (Fruil Returns received too late for inclusion in Tables).—*J. Y.*—*W. H.*—*W. H. S.*—*W. H. Aggett*—*H. J. C. R. N.*—*H. D.*—*J. Y.*—*A. Butcher*—*R. N.*—*O. OPUNTIAS.

THE Opuntias form a well-defined genus of the Cactus family. They show a near relationship to the Pereskias, to which indeed a certain number of Opuntias has for a long time been referred.

Linné, who possessed a very imperfect knowledge of these plants, considered them varieties of one species, which he called Cactus Opuntia. De Candolle, in his *Plantes Grasses*, was of the same opinion. Miller was the first to establish the genus, using Linné's specific name. Haworth, in his *Synopsis Plantarum Succulentarum*, describes fourteen species. De Candolle, in his *Prodromus*, treats of thirty-three.

In the first half of the last century, when the cultivation of Cacti and other succulents was at its zenith, by far the greatest number of species were described by Prince Salm-Dyck, Lemaire, Pfeiffer, Link Otto, &c.; and later by the famous American, Dr. Engelmann. In our days many new species have been noted, chiefly by Dr. Weber, Paris, and by Prof. Schumann, of Berlin. At present the genus numbers from 140 to 150 species, which, however, are not all sufficiently known. As with all other suc-

culents, much confusion exists as regards the original types. Very often these have been lost from gardens, and unfortunately

without flowers or fruits. These plants from sunny and dry countries can only show their real nature where the conditions of life do not differ too greatly from those of their native country; for instance, in the Mediterranean region. Here indeed they are to be found half wild, and sometimes covering extensive tracts of rocky ground. The species generally met with are *Opuntia Ficus indica*, *O. monacantha*, and *O. vulgaris*. The latter now grows abundantly among the southern Tyrolese Alps, and by the Italian lakes.

BOTANICAL CONFORMATION.

Opuntias are Cacti with more or less elongated and jointed stems. The joints are flat or cylindrical, ellipsoid or globular. The young shoots bear distinct although mostly small leaflets, which soon fall off. Others have larger and more permanent leaves. The leaves are spirally distributed all over the joints, in the flattened as well as in the cylindrical ones. In their axils is situated the areola, and frequently the axis is more or less elevated on this place. The areolæ (fig. 32) are generally rounded and very small; they are covered with whitish or yellowish down.

FIG. 32.—OPUNTIA STRICTA.

1, an areole.
11, Section of an areole, showing the growing point at a; b, base of fallen leaf; c, glochids; d, woolly hairs. (All real size.)

no specimens were kept in the herbaria. Without sufficient data and with often only very poor descriptions it is an impossibility to say whether a certain plant now in

FIG. 34.—FLOWER OF OPUNTIA FICUS INDICA, SEEN IN SECTION. (Reduced)

FIG. 35.—FRUIT OF OPUNTIA MONACANTHA. (Half size.)

FIG. 33.—OPUNTIA SUBULATA. Secondary flowers proceeding from the top of the old flower. (Half size.)

our gardens is really the same as that described by the authorities already mentioned. Many of these species have been described from small plants grown under glass and in rather abnormal conditions,

In the lower part of the areola spines are developed, while the upper part is (often in the form of a little brush) closely filled with "glochids." These glochids are a kind of prickle, which only occurs in the genus *Opuntia*. They are small and loosely attached, and are furnished with a barbed point, which makes them terrible weapons, as at the slightest touch they penetrate the skin, and can only be removed with difficulty. Some *Opuntias*—for instance, *O. microdasys*—only possess glochids, and although they look very inoffensive, they are of the most dangerous character.

The larger spines of *Opuntias* have also barbed and extremely acute points, which renders their sting very disagreeable; those of *O. tunicata* are especially painful. It is easier to tear away the whole branch than to get these spines out of your finger.

The areolæ, or woolly points in the axils of the leaves, correspond to the buds on a branch of a tree. They are the points from which vegetation starts, either into growth or flowers. They remain a long time active, and even in very old plants they annually send out spines which are often more formidable than those of younger areolæ.

Although joints and flowers are occasionally produced from any of the areolæ, they generally grow from the uppermost, or from those on the margin. The flowers are sessile, with a thick and short ovary, which has leaves, areolæ, and spines,

exactly like an axis. That it really partakes partly of the nature of an axis can easily be seen on those which produce no seed, but remain green and fresh like a branch. In the second year they often send out a new flower from one of the areolæ on the top. In this way quite a chain or succession of growth is maintained (see fig. 33).

The corolla is rotate, which means there is no deep funnel-shaped tube, as in most other Cacti, but the sepals and petals are spreading (see fig. 34). The bottom of the flower—or the top

impossible, because the style is always longer than the anthers. The style is generally thickened below, and tubiform above. The stigmata vary from four to thirteen; they unite in a head, or are spreading.

The fruits (see fig. 35) of the *Opuntias* are berries. Their shape, colour, juice, &c., vary according to the species. In many cases they offer the best guide to the recognition of the different kinds. Some are much appreciated as an article of diet—for instance, the Prickly Pear.

FIG. 36.—*OPUNTIA ARBORESCENS*, 30—40 FEET HIGH.

of the ovary, is generally a little concave. It is not exactly right to speak in Cacti of sepals and petals, as there exists no clear distinction between the two, but for convenience' sake we may as well call them so here. The outermost segments are short and fleshy; the inner are membranous, larger, and often of a brilliant red or yellow colour. They only open in full sunshine, and last from one to three days.

The stamens are very numerous, and spirally inserted. In nearly all the species they are shorter than the petals, and spreading; they are so sensitive that if the bottom of the filaments be touched, these will soon move towards the centre of the flower. Thus, the insects visiting the flowers are well pollinated. Self-fertilisation is

In some species the fruit gets hard and dry, as in *Opuntia cylindrica*.

The seeds of *Opuntias* differ from those of all other Cacti; they are roundish and flattened, with a hard testa; on the margin they are generally marked with a line. They are of a whitish colour, mostly glabrous, but sometimes villous. The embryo is annular, curved, with two, rarely three, large cotyledons.

The seedlings of all species make first a cylindrical, little differentiated stem, which soon begins to show its specific peculiarities.

Opuntias occur throughout America between 56° N. and 52° S., that is, from S. Canada to S. Patagonia. The West Indies and the Galapagos also possess a number of indigenous species.

CLASSIFICATION OF THE SPECIES.

Engelmann was the first to make a clear distinction between the genera *Opuntia* and *Pereskia*. Weber further pointed out the differences in the seeds, and Schumann those in the ovules.

Weber was the first to give us a good natural subdivision of the genus by retaining and defining more clearly those of Engelmann and Lemaire. Schumann added another section, and made the following subdivisions:—I. *Pereskopuntia*; II. *Brasiliopuntia*; III. *Cylindropuntia*; IV. *Tephrocactus*; V. *Platyopuntia*. Schumann should also have added to his series "*Cruciformes*."

Salm-Dyck included those *Opuntias* with exserted stamens in a separate genus, *Nopalea*. Although this is a very distinct characteristic, yet the plants agree so much with the common *Platyopuntia* that I prefer to re-unite them with the genus *Opuntia*.

FIG. 37. *OPUNTIA LEPTOCAULIS* VAR. *LONGISPINA*. (Reduced one-half.)

Adopting this view, the *Opuntias* are naturally classified in the following manner:—

OPUNTIA, Miller.

I. Plants with well-formed, large and flat joints:—

i. *Pereskopuntia*, Weber.

II. Plants with small cylindrical leaflets, soon falling off:—

1. Joints cylindrical or clavate:—

ii. *Cylindropuntia*, Engelmann.

2. Joints ellipsoid or globular:—

iii. *Tephrocactus*, Weber.

3. Joints flat:—

iv. *Platyopuntia*, Engelmann.

A. Joints differentiated in stem and branches, the stem with continual growth at the top:—

a. Stem round, cylindrical:—

1. *Brasiliopuntia*, K. Schumann.

b. Stem flat:—

2. *Consolea*, Lemaire.

(*Cruciformes*, Schumann.)

B. Joints all alike:—

a. Stamens exserted, longer than the petals:—

3. *Nopalea*, Salm.

b. Stamens included, shorter than the petals:—

4. *Tuna*, A. B.

The first section, *Pereskopuntia*, forms a connecting-link to the genus *Pereskia*, as is indicated by the name. In habit the plant resemble this genus so much that they have been referred to it. Six species are known, but they are seldom seen in gardens. They are all natives of tropical Mexico, one only is Californian. They have very long cylindrical branches, and flat, roundish, or

oblong leaves. The flowers are mostly yellowish, but those of *O. spatulata*, Weber, are said to be red. One species, *O. Pititache*, Web., is a very spiny tree, with horizontal branches. The Mexicans call it "La Cruz del Matrimonio."

The second section comprises all the species with elongated cylindrical stems; they occur from North to South America. Many of them are trees (see fig. 36), sometimes 30 to 40 feet high; others are shrubby or very low plants,

stems about the thickness of a pencil, and long spines (see fig. 37). Those of *Opuntia leptocaulis*, D.C., var. *vaginata*, Web., are enclosed in fine yellow sheaths; their flowers are very small and yellow. These plants very seldom flower, and produce scarcely any seeds. The ovaries remain sterile, and turn red like berries, but continue to send out little shoots. These easily break off, and thus the plants are generally propagated. These *Opuntia* *Monacanthæ* are North American.

which remains on the long spines when they are removed by force. These spines form natural pins. This *Opuntia* was for a long time considered to be a *Pereskia*, on account of its leaves, but the flowers and seeds are those of a true *Opuntia*. The seeds exceed in size those of any other *Opuntia* known.

Opuntia cylindrica, De Candolle, from Chili, belongs to the same group; it looks somewhat like a *Cereus*.

Opuntia floccosa, Salm., and *O. vestita*, Salm., from Peru and Bolivia, have long hairs in their areolæ. The former reminds us of the well-known *Cephalocereus senilis*, but it is much smaller.

The third section, *Tephrocactus*, comprises about fourteen species of very curious aspect. As stated above, they form little roundish or ellipsoid masses of a greyish-green colour. They can easily be divided into two groups—those with large, flat, papery spines, and those with common cylindrical spines. To the former belongs *O. diademata*, Lem., often found in gardens (see fig. 39); to the second group belong

FIG. 38.—*OPUNTIA SUBULATA* AT LA MORTOLA.

which hardly deserve the names of shrubs. Some of the North American species bear their spines enclosed in sheaths. In La Mortola we have one very formidable species, the already-mentioned *Opuntia tunicata* from Mexico. It forms brilliant white masses 1 to 2 feet high, which are a great attraction to the numerous visitors, who cannot resist the temptation to touch it and make the acquaintance of its terrible spines.

Other curious-looking *Opuntias* are those which Schumann calls *Monacanthæ*. They have slender

In South America occur plants of the same habits and appearance; but their spines are simple—viz., without sheaths. To these belongs *Opuntia Salmiana*, Parm., an old well-known garden plant.

Opuntia subulata, Engelm., is the most stately *Cylindropuntia* from South America; it is wild in Chili. In La Mortola it grows to a height of nearly 3 m. (9 feet), as is shown by the accompanying photograph (see fig. 38). Its branches are 2 to 3 inches thick, and bear long subterete leaves. The areolæ are filled with white down

FIG. 39.—*OPUNTIA DIADEMATA*. (WHOLE PLANT.)

O. aoracantha, Lem. (see fig. 40), and *O. ovata*, Pfeiff.

Some *Opuntias* have been referred to this section which would better have been placed amongst the *Platyopuntias*, as when old they form flat blades.

We have only a limited knowledge of the species of *Tephrocactus*. We know next to nothing about their flowers and fruits. They are all natives of South America, the distribution of the genus reaching there to its most southerly point.

The fourth section, *Platyopuntia*, comprises those with flat joints, known to everyone as "Prickly Pears." They are natives of the whole American continent, but are more common in North America, where some exist at the most northern point where the genus is found.

The first sub-section is formed by *Opuntia brasiliensis*, Haworth, a native of Brazil and Argentina. It differs in growth from the rest. It forms a main stem, which continues growing at the top, being terete, while the branches are flat. The flowers are yellow, and do not differ in any essential way. There is a good figure in the *Botanical Magazine*, 3,293. Though it is a tropical plant, it does well in La Mortola, and flowers annually. When old, the plant forms a tree; the lower branches fall off, just as do those of some *Euphorbias*—for instance, *E. grandidens*.

The second sub-section is of similar habit, only the main stem is flat, and the branches are directed distichously; the plants thus assume the aspect of a cross. They are formidably armed with numerous spines, which often exceed 2 inches in length. The flowers are also very curious.

FIG. 40.—*OPUNTIA AORACANTHA* (ARGENTINA), FROM THE GARDENS, HOLLY POINT, HEATON MERSEY.

The ovary is flat, like a small joint; at the base the style is surrounded by a cup-shaped disc. On account of this, Lemaire founded the genus *Consolea*, named after Angelo Console, head gardener at the Botanic Garden, Palermo. *Opuntia spinosissima*, [Miller, is the best-known plant of this group; it comes from the West Indies. Probably two or three other species not yet sufficiently known may also belong to *Consolea*.

The third sub-section contains those *Platyopuntia* with stamens and style longer than the petals—the *Nopalea*, Salm. *Opuntia coccinellifera*, Mill., of which the drawing (see fig. 41) shows the flower, is the best known of this group. It is the plant famous for the cultivation of the cochineal insects, on account of its being nearly spineless. It is said to be a native of South Mexico.

Opuntia dejecta, Salm., and *O. Auberi*, Pfeiffer, are two other species belonging to this group. They are natives of Cuba. *Opuntia moniliformis*, Steudel, from San Domingo, is said to be also a *Nopalea*. *Opuntia Karwinskiana*, Salm., has not been introduced into Europe alive.

Sub-section 4, for which I propose the name "Tuna," comprises the bulk of the species of the whole genus. Although very similar in general aspect, they greatly differ in detail. Dr. Weber was the first to point out the importance of the fruits in this group.

A certain number of these Tunæ have the blades set with velvety, short hairs. *O. tomentosa*, Salm., for instance, is a tall, arborescent, much-branching species. Its limbs being unarmed by spines, it has been used for cochineal cultivation. Its flowers are deep red. *Opuntia hyptiacantha*, Weber, *O. crinifera*, Pfeiffer, *O. Scheerii*, Weber, have radiating spines and beautiful yellow flowers. *Opuntia leucotricha*, De Candolle, and *O. ursina*, Weber, have the older limbs completely covered with long, inoffensive spines. The fruit of the former is a yellowish-white berry, and it has a delicate flavour. It is sold in Mexico under the name of "Duraznillo" (Little Peach).

The rest of the Tunæ are all glabrous. It is difficult to define their relations to each other.

Species which are easily classed with *Opuntia Ficus indica*, L. (see fig. 42), are *O. Amyclæa*, Tenore, *O. decumana*, Haw., and *O. elongata*, Haworth. *Opuntia Amyclæa*, Tenore, is certainly nothing else than a spiny form of *O. Ficus indica* in its wild state, whilst those commonly known under this name are forms derived by cultivation with better fruits and fewer spines. In fact, the

flowers and fruits of *O. Amyclæa* and *O. Ficus indica* agree in every respect.

Opuntia robusta, Wendland, may also be mentioned here. Its large and thick limbs are sometimes more than 12 inches in diameter, and are extremely glaucous; its flowers are yellow, and its fruit resembles a small Apple. It is often cultivated in gardens, mostly under the name of *O. grandis* or *maxima*. Further, a certain number of *Opuntias* are distinguished by green joints, yellow spines, and Pear-like, clavate, red fruits with purple juice. Of these, *Opuntia Tuna*, Miller, may be considered the type.

FIG. 41.—*OPUNTIA COCCINELLIFERA*. (Flower, half size.)

Opuntia Rafinesquei, E. and B., and *O. vulgaris*, Miller, form another group. They are dwarf plants with small roundish joints. They are the hardiest of all the genus. *O. Rafinesquei* even reaches Cape Pelée on Lake Erie, Canada. Closely related to this group are *O. missouriensis*, *rhodantha*, *xanthostemma*, &c. These are largely cultivated in the open air in Northern Europe.

Although the above is only a very short account of the genus *Opuntia*, I hope to have shown that it contains many points of great interest, and that much may still be done to complete our knowledge of these plants.

In gardens they are generally disliked, certainly not without good reason; but here, in the

FIG. 42.—*OPUNTIA FICUS INDICA* AND *O. MICRODASYIS*: AN ALOE IN THE FOREGROUND.

NEW OR NOTEWORTHY PLANTS.

CEREUS GREGGII.

A CACTUS with a large tuberous root is an anomaly, reserve food-material being almost invariably, in the plants of this order, stored in the succulent stems, the root system being com-

hard clayey soil. The [root] is 18 inches long, 8 inches in diameter, and it weighs 12½ lbs. "This characteristic species seems to be scattered and rare throughout its range (Texas, New Mexico, and Arizona). A single stem usually arises from the enormous root, but sometimes there may be many stems" (Coulter). The plant here shown has a forked stem, but in the other plant at Kew the stem is unbranched. The flowers are described as whitish or ochroleucous, 6 to 8 inches long, and about 2 inches across. W. W.

SAUROMATUM BREVIPES, N. E. BR. (N. SP.)

This is one of the most distinct and at the same time one of the prettiest Aroids I have seen. Except in its pedate leaves it bears very little resemblance to the well-known *S. guttatum*, than which it is much smaller, for the pale purplish-tinted spathes, instead of being solitary as in that species, are numerous and crowded together in a mass, producing a rather pleasing effect. Although new to cultivation it is not new to science, but has been misunderstood botanically. It is a native of the Sikkim Himalayas, where it was long ago discovered by Sir Joseph Hooker, whose specimens (in fruit only) were thought by Schott to belong to *Typhonium pedatum*; this, however, I have shown to be incorrect at the place quoted below. Subsequently it was described by Sir Joseph Hooker as *Typhonium brevipes*, but only one perfect inflorescence was then available, and, on account of its flattened condition, the fact that the basal part of the spathe was connate into a tube (the distinctive character of *Sauromatum*), and not simply convolute (as it should be in *Typhonium*), was overlooked. In the living plant this character is very evident, and although unlike other species of *Sauromatum*, it is clear that this plant must now be transferred to that genus. As no complete description of it in a flowering state has yet been published, I subjoin the following, made from a living plant which flowered in the Botanic Gardens, Cambridge, in June, 1902. A drawing of it has been prepared for the *Botanical Magazine*.

Rootstock a tuber, in young leaf and flower at the same time. Leaves 1-3 from a growth, pedate, glabrous; petiole 4½-15 inches long, smooth, of a dull purplish-red tint, without markings; segments 5-9, linear-lanceolate or lanceolate, tapering to a very fine point, the middle one 3-10 inches long, 5-16 lines broad, sessile or united with the decurrent bases of the lateral segments, which are gradually smaller, all dark satiny green, with the midrib and edges dull purple beneath. Spathes lateral or surrounding the leaves, crowded. Peduncle ½-¾ inch long, scarcely rising above the surface of the ground, smooth, glabrous. Spathe-tube 1¼ inch long, ¾-¾ inch in diameter, glabrous, inflated-ellipsoid for about 1 inch of its length, angular from mutual pressure, constricted and dorsally compressed above, very pale green, with pale dull purplish spots; limb 4¼-5¼ inches long, ½ inch broad at the oblique base, where it is arched forward, with wavy margins, thence gradually tapering to the very acute apex, and more or less twisted in the upper part, outside of a pale dull purplish tint, darker purple inside at the base and in the throat of the tube. Spadix as long as the spathe, sessile; female part about ¼ inch long, broadly ovoid; the part between the ovaries and anthers 6-7 lines long, white, and bearing two whorls of stout, spreading, clavate, white neuter organs in the lower half, dark-purple, and very rough or shaggy with minute processes in the upper half; male part ¼ inch long, ¼ inch thick; appendix 5-5½ inches long, 1½ line thick at the base, terete, tapering, more or less curved forwards, usually somewhat flexuose, olive-green or dull ochreous, more or less tinted with purplish on the lower part. Ovaries very numerous, densely crowded, minute,

FIG. 43.—*CEREUS GREGGII*, ROYAL GARDENS, KEW.

paratively small. In *C. Greggii*, however, the root appears to be the reservoir, whilst the stem is rather thin and woody. The example represented in the accompanying photograph (fig. 43) is one of two exceptionally large ones lately imported with other large Cacti from Arizona, where this species is said to grow in gravelly or

South, they play a conspicuous part in the landscape. Their flowers are of the most brilliant and finest tints, and during our hot summer months they form the chief ornament of our gardens. *Alwin Berger, La Mortola, Italy.*

[The *Kew Index* adopts Miller's spelling of "Pereskia" instead of the more recent and perhaps more correct "Peireskia." For the sake of uniformity we follow the *Index Kewensis*. ED.]

THE HAY CROP OF 1903.

THE Rothamsted experiments on the mixed herbage of permanent grass land, which have now been continued over a period of forty-eight years (from 1856 to 1903), both without manure and with different descriptions of artificial manures, each manure being applied year after year to the same portion of land, show very variable results as to the amount of Hay obtained in the present season.

The plot which has received no manure whatever for the whole period of forty-eight years has given a little over half a ton of hay per acre, which is only about one-half the average produce for this plot of land.

Superphosphate of lime, used alone, yielded nearly 23 cwt. of hay per acre, which is slightly over the average for this plot.

The plot receiving each year sulphates of potash, soda and magnesia with superphosphate, gave 49½ cwt. of hay per acre. This is 14½ cwt. per acre in excess of the average of the forty-eight years for this plot, which is due to the extensive growth of the Clover plants in the herbage encouraged by the application of potash in the manure. Not an ounce of nitrogen has been applied to this particular plot during the whole of this long period, but the Clovers favoured by the potash have been the collectors of the necessary nitrogenous food from the stores in the atmosphere.

An adjoining plot, which receives the same descriptions of manure each year, except that potash is omitted, has yielded only 23½ cwt. of hay per acre, and is 4¼ cwt. less than the average produce. Thus, without potash, although all the other minerals, including phosphates, were used, the Clovers and Vetchlings could make no progress, and the nitrogen was not collected. Consequently even the grasses made very meagre growth. The omission of potash made a difference of 26½ cwt. of hay per acre, and the yield was of an inferior quality.

Sulphates of potash, soda, magnesia, and superphosphate, with the combination of 400 lb. ammonia salts per acre, yielded 50 cwt. of hay. The same mineral manures, in combination with 550 lb. nitrate of soda per acre, produced 53½ cwt. of hay; both these plots are slightly under average; while the plot which received the highest manure dressing yielded 79½ cwt. of hay. On this plot the produce was nearly 4 tons of coarse, strong-growing grasses, to the absolute exclusion of any Clovers. This heavily-manured plot produced more than half a ton of hay per acre in excess of the average quantity, but of a very inferior quality.

The area of several of the plots has this year been divided, and upon one half, in addition to the usual manures, has been applied a dressing of 1,000 lb. of ground quicklime per acre. The dryness of the season up to the beginning of June prevented the lime from producing its full benefits, but a gain in produce has in most cases been obtained, sometimes to the extent of half a ton of hay. The best effect is shown where there was an available supply of potash in the soil.

Splendid weather, with bright sun at the time of hay-harvest, high temperature, and strong winds, has contributed very largely to the successful in-gathering. There was this year little difficulty in obeying the old adage to "make hay while the sun shines." *J. J. Willis, Harpenden.*

$\frac{3}{4}$ line long, compressed-obovoid, very pale yellowish-green as seen in the mass, one-celled; stigma sessile, minute. Ovules two, erect, basal, orthotropous. Anthers numerous, crowded, yellow. Typhonium pedatum, Schott, in *Oesterr. Bot. Wochenbl.*, 1857, p. 262 partly; see N. E. Brown, in *Journ. Linn. Soc. Bot.*, v. 18, p. 260; T. brevipes, Hook., fil., *Fl. Brit. India*, v. 6, p. 511.

The following specimens of this species are in the Kew Herbarium:—Sikkim, 7,000 feet, Hooker; Darjeeling, 7,500 feet, Clarke 26708; Sonada, 7,000 feet, Clarke 28091; Jore Pokri, 7,600 feet, Gammie. N. E. Brown.

ORCHID NOTES AND GLEANINGS.

BURFORD LODGE, DORKING.

SIR TREVOR LAWRENCE'S collection of Orchids, the oldest in Europe, has never looked in such fine condition throughout as at the present time, although it has always been among the best, and its excellence is all the more praiseworthy when it is considered that it includes a very large number of rare species from little-known countries, and with many of which other orchidists have had sad experience. But even at Burford the "ups and downs" of Orchid-culture has been experienced. Some of the species which now thrive there to perfection gave trouble in the beginning, and others of which only one or two specimens were ever obtained, departed. Even failures brought experience, and the collection to-day is the better for them.

Orchidists are "taking sides" on the question of culture in leaf-soil, or some preparation in which partly-decayed leaves form the greater proportion. Sir Trevor Lawrence sides with the advocates for the use of leaves, and, like all the others who are successful with it, has his own formula. No stronger proof of the benefit to be derived by those who know how to use leaves in part as a compost in which to grow Orchids could be found than the marvellously vigorous condition of all the Orchids in the Burford collection. Mr. W. H. White, the Orchid-grower at Burford, is very enthusiastic in its praise, and showed plants which were in a critical condition—as, for example, some of the rare Brazilian cool-house *Oncidium*s, *O. Larkinianum*, *O. Mantinii*, &c.—which were fast declining before being placed in the leaf preparation, but which are now in splendid condition. The several houses of *Odontoglossum*s, which contain so many valuable varieties of *O. crispum*, &c., also by their vigorous growth and superb flowering proclaim the advantages of the new method of culture.

Among the *Cypripedium*s it is pleasant to note the increasing size and strength of the fine specimens of *C. Stonei platytenium*, and that a plant of *C. Fairianum* is in splendid health. If the few known plants of it continue to decline as they have been steadily doing, and this one to improve as it has done lately, it will be the sole survivor. Moist intermediate temperature, shade, and a much more liberal supply of water than was formerly given it has saved it. Other *Cypripedium*s finely in bloom were several *C. × tonso-Rothschildianum* (with very large distinctly-formed flowers), *C. × Harrisianum superbum* (still the finest of its section), *C. × Clinkaberryanum*, a very beautiful form of *C. Chamberlainianum*, and an effective cross between *C. Rothschildianum* and *C. superbiens*. The foliage of the large specimens renders the plants beautiful even when not in flower, and the number of new seedlings yet to flower promise well.

In the same large span-roofed house in which the specimen *Cypripedium*s are grown, the large plants of the different species of *Phalænopsis* were observed in the best possible health. *P. violacea* is in flower. Suspended from the roof are a very remarkable collection of *Bulbo-*

*phyllum*s and *Cirropetalum*s, *B. patens* (with purple stellata flowers), *B. longisepalum* (with long, beaked, purple blooms), *B. barbigerum* (the motile, feather-lipped), *B. elegans* (with singular inflated-looking white and purple flowers), and some others being in bloom.

Eucharis grandiflora grows and flowers well planted beside the walk in front of the hot-water pipes; and at one end is a number of specimens of *Anætochilus*, *Macodes*, *Hæmaria*, &c., with beautifully coloured foliage. Most of the specimens are grown under bell-glasses, but *Goodyera Rollissonii*, *Hæmaria discolor*, and some others are thriving so much better planted in the moss of the other Orchids and without bell-glass protection, that that plan will be extended.

The large span-roofed house in which the *Sobralias* occupy the central atage has still some of those plants in bloom, and the collection of *Epidendrum*s grown in the same house has the scarlet *E. cinnabarinum*, *E. Schomburgkianum*, *E. fulgens*, *E. Linkianum*, *E. pterocarpum*, *E. × radico-vitellinum*, &c.

The *Cattleya* and *Lælia* houses have a number of *C. Warszewiczii* in flower, among them being the rare *C. W. saturata* (in which the eye-like whitish patches on each side of the labellum of the ordinary form are obliterated), *C. Rex*, *C. × Adolphus* (with rich orange flowers spotted with purple), *C. × Miss Harris*, *C. × H. S. Selfridge*, and some others, the best of which is a hybrid *Lælio-Cattleya* between *L.-C. Schilleriana* and *L. purpurata*, raised at Burford, the excellence of which may be attributed to the fine varieties used in its production.

The cool *Masdevallia*-house, with its shelf of rare *Pleurothallis*, *Octomerias*, *Stelis*, &c., always has a good show of flowers. Among the *Masdevallias* in flower, *M. × coriacea × Veitchiana* has distinct orange-tinted flowers; a large form of *M. maculata* has flowers of a purple colour; and *M. trichæte*, *M. muscosa*, *M. calura*, and others are in bloom. In this cool-house *Stenoglottis longifolia* thrives well; and in an adjoining small house the *Disas*, which have formerly given trouble, have a number of *D. grandiflora* giving their showy scarlet blooms.

The *Aërides* and *Vandas* are in excellent condition. These plants are of late years considered the most difficult to grow successfully, yet at Burford they are among the best subjects in the collection, some of the plants (such as the two fine specimens of *Aërides Schroderi*, the original *Aërides Lawrenceæ*) having been there many years.

Other interesting things in bloom in the Orchid-houses were *Grobya galeata*, *Gomesa laxiflora*, *Polystachya villosa*, *Odontoglossum bictonense album*, *O. aspidorhinum*, with many spikes; *Dendrobium cumulatum*, *D. sulcatum*, *Cirrhaea viridipurpurea*, *Zygopetalum velatum*, a remarkably fine *Oncidium pulvinatum*, *O. phymatochilum* with a thirteen-branched spike, and other *Oncidium*s; the singular *Sarcochilus hainanensis* with many spikes forming, *Angraecum filicornu*, *A. Eichlerianum*, *A. carphorum*, *Eulophia guineensis*, and *Sophræ-Cattleya × Chamberlainiana*.

In the greenhouses the pretty *Lobelia tennior* is a mass of dark-blue colour, the hybrid *Streptocarpus* very showy, the *Anthurium*s good, and the new *Passiflora maculifolia* a handsome-leaved climbing plant.

THE FLOWER GARDEN

at Burford always presents many rare and pretty flowers, as well as most of the standard favourites at their best. The coloured *Water-Lilies*, both in the basin on the lawn and in the sunk tubs in which the duplicate plants are kept, have produced a fine show of flowers. On the walls *Solanum Wendlandi* has flowered this year as well as formerly; *Hidalgoa Wercklii* has a number of pretty scarlet flowers; *Lathyrus pubescens*

has many trusses of pale-blue, and *Gerbera Jamesoni* some orange-scarlet blooms. In the beds and borders the *Violas* are very fine this year; so also the *Roses* and *Carnations*; the hardy *Crinum*s have in bloom a large number of the pure white *C. × Powellii album*, many of the original pink form, and a quantity of *C. Moorei*, which is later to bloom, just sending up spikes. *Convolvulus althæoides* is a charming and uncommon plant. It has formed a large patch of silver-grey leaves and pink flowers in the border, and is running up the fence at the back. *Romneya Coulteri* is a mass of satiny-white flowers. *Campanula macrostyla* has large salver-shaped blooms, and a bed of *Tulbaghia violacea* is very showy.

REMARKS ON THE CONDITIONS OF THE FRUIT CROPS.

(See Tables, ante, pp. 72—77.)

0. SCOTLAND, N.

ORKNEY.—The cold weather generally and sharp frosts in the spring destroyed the fruit while it was yet in the bud, and what little formed soon dropped off. *Thos. MacDonald, Balfour Castle Gardens.*

ROSS-SHIRE.—The fruit crops are on the whole very satisfactory, for we were fortunate in not having the frost which did so much damage about June 20. Apples are a fine crop; some young trees which I planted two years last season have very good crops. Pears are also a very good crop, and Plums are plentiful. Gooseberries are the finest crop I have seen for years. Strawberries have been good and finely flavoured, we still have a good supply (July 24). Peaches are nothing like what we are used to. Raspberries and all small fruits generally have grand crops. *Henry Henderson, Cromarty House Gardens.*

SUTHERLANDSHIRE.—Apples are a very poor crop, the worst for a number of years. There was little or no bloom on many of the older trees, probably owing to the wood being badly ripened last season. Strawberries are good; Raspberries good but late. Other small fruits have average crops, excepting Gooseberries, which are much under the average. *S. Melville, Dunrobin Castle Gardens, Golspie.*

1, SCOTLAND, E.

ABERDEENSHIRE.—Apples are a general failure, as also Gooseberries; Strawberries an average crop, but some of the late varieties suffered from a frost on June 19. Most of the small fruits are about ten days later than usual. *James Grant, Rothie Norman Gardens.*

—The fruit crops in this part are very partial, taking them all over, owing to the last season being so wet and so little sunshine to ripen the wood; also the cold frosty nights of May and early in June did a good deal of damage. A few varieties of Apples, such as Lord Suffield, Stirling Castle, Keswick Codling, are cropping fairly well. Pears are scanty and very poor. Plums on walls are an average, particularly the Victorias. Bush fruits of all sorts are much under the average of former seasons, and are late. *John Brown, Delgaty Castle Gardens.*

—The fruit crops are the worst we have had for years, especially Apples and Pears, which showed an abundance of blossom, which set well; but the continuance of cold at night, together with the lack of rain, ruined the crop; and not only have the fruits dropped, but on most of the trees the leaves around the buds have all decayed. *J. Frazer Smith, Cullen House Gardens.*

BERWICKSHIRE.—The Apple crop is the worst we have had here for many years. There was a fair amount of bloom, but during the setting period a spell of cold, unless weather set in, and

the fruit did not set. What fruit we have is mainly on Codlin varieties. The trees had a second show of blossom, which is very exceptional. As to amount, Pears are a better crop than Apples, but still below the average. Doyenné Boussouch Pear never fails to crop here. Strawberries are an extra large crop, and of good quality. Small fruits fair. *John Cairns, The Hirsell Gardens, Coldstream.*

FORFARSHIRE.—The fruit crops in the gardens here, taken altogether, are rather below the average. Apples are not nearly so regular a crop as usual, some trees carrying good crops, while others are very thin or are bare of fruits. The Plum crop is a good one, and the trees are making healthy growth. Strawberries are turning out better than I anticipated, and since the rains came the later varieties improved much. Black and red Currants and Gooseberries are below the average. Raspberries are a fair crop. *W. McDowall, Brechin Castle Gardens.*

— Owing to the sunless season of 1902 the wood of the fruit-trees was in an ill-ripened condition, consequently there is a very thin crop of all large fruits. Small fruits, with the exception of Black Currants, are a fair crop. Strawberries, having now got sufficient moisture at the root, only want sunshine to ensure a heavy crop. Raspberries are looking well. Late Peaches under glass retained their leaves in a green state for a long time in the autumn of 1902; and although a good set of fruit was secured, only a very thin crop is now swelling. *Thos. Wilson, Glamis Castle Gardens.*

HADDINGTONSHIRE.—The worst we have experienced since 1880. Fortunately, Currants, Gooseberries, Strawberries, &c., are a crop; but, as a whole, these too are below average, and only to-day I hear from a salesman that Black Currants are selling at "ransom prices." *R. P. Brotherton, Tynninghame Castle Gardens.*

— The fruit crops in this locality are very irregular, owing chiefly to the lack of rain after the fruit was set, and also to the cold east winds experienced during the flowering period. Apples are an average crop, but Plums and Pears are very light; of the first, Keswick Codlin, Lord Suffield, East Lothian Seedling, and Warner's King are the best; while of the last, trees of Souvenir du Congrès, Durondeau, Easter Beurré, and Madame Treyre, are carrying the heaviest crops. Apricots did not suffer so much as Peaches and Nectarines, consequently some varieties are heavily laden, especially Moorpark and Large Early. Strawberries, Raspberries, and Black Currants are very fine. *Wm. Galloway, Gosford Gardens, Longniddry.*

KINCARDINESHIRE.—The early part of the season was very unfavourable for the success of the fruit crop, being wet and cold with nasty harsh frosty winds, and the Apples, being latest in flower, have had the best chance. Everything remained stationary during June owing to the dry weather prevailing, since which we have had rain and heat, and all fruits are swelling rapidly. *J. M. Brown, Blackhall Castle Gardens.*

MIDLOTHIAN.—A fall of snow in April, followed by successive nights with 8° to 10° of frost, destroyed the opened flowers on fruit bushes. Black Currants are a failure, the exception being in late districts and with late varieties. From the same reasons Gooseberries are a partial failure; Red Currants are a heavy crop; Strawberries are of good size, and the crops above the average. Apricot and Peach-trees showed but few flowers, the result of the heavy crops of last year and the lack of sunshine to ripen the fruit and wood. Plum-trees flowered heavily, but a continuance of cold north-east wind made even the hardiest drop all their fruit. Pears are a very thin crop. Apple-trees flowered and set

well, but a large proportion of the fruit when of the size of marbles fell off—a common sequel to had ripened wood. The good exceptions are few, the best being Golden Spire and Worcester Pearmain. *James Whytock, Dalkeith Gardens.*

— The prospect of an all-round good year of hardy fruit in this district was very promising in early spring, the fruit-trees being generally masses of bloom; but owing to the cold, wet, sunless autumn of 1902 the wood did not ripen, and the blossoms, especially those of Apricots and Pears, failed to set. There are a fair crop of Apples on trees of Ecklinville and Lord Suffield; Plums and Cherries are below the average; Raspberries are a large crop and good; Black and Red Currants are under the average; Strawberries are good. *D. Kidd, Carberry Tower Gardens, Musselburgh.*

PEEBLES SHIRE.—Apples are nearly a complete failure; Plums, with the exception of Denyer's Victoria, are a very thin crop. Cherries are abundant and of good quality. Strawberry-plants suffered a good deal from spring frosts. Gooseberries on high land are an average crop, whilst those that were earlier in flower on lower land got destroyed by frost. *M. McIntyre, The Glen Gardens, Peebles-shire.*

6, SCOTLAND, W.

AYRSHIRE.—Fruit crops hereabouts of all kinds are much below the average. Apples are almost a failure. Small fruits have very thin crops, which is not to be wondered at after experiencing 16°, 11°, 9°, 7° of frost on successive nights in the middle of the month of April. *W. Priest, Eglinton Gardens.*

DUMFRIESHIRE.—The weather conditions for the past twelve months have been in this district most unfavourable for successful fruit-growing out-of-doors. All over the south-west of Scotland Apples and Pears are, even in favoured spots, very much under the average, and stone fruits, such as Apricots, Peaches, Plums, Cherries, &c., are comparatively speaking a failure. Amongst small fruits Raspberries and Strawberries are the only kinds that are giving anything like a remunerative crop. In most cases Gooseberries and Currants are a complete blank. I am afraid 1903 will stand clearly out as one of the worst fruit years on record. At least, in this district it will be remembered and written down as such. *John Mackinnon, Terregles.*

— Apples, Pears, and Plums are almost a total failure, although the trees flowered exceedingly well. Black Currants are fairly good in quality, but the crop is under the average; and the same remarks apply to red and white Currants and Gooseberries. Raspberries are the best of the small fruits, having escaped the late spring frosts. La Grosse Sucrée Strawberry is the best with me this year; others have very poor crops, for although the plants flowered fairly well, the fruits did not set, forming small hard knots instead of fruit. *J. McDonald, Dryfeholm Gardens.*

STIRLINGSHIRE.—The blossoms of Apples, Pears, and Plums were destroyed by the frosts in May—17° on one occasion—and the crop of these fruits is the worst known in this locality for the last thirty years. Raspberries are a full crop. The mite is very prevalent on Black Currant bushes. *Alex. Crosbie, Buchanan Gardens, Stirlingshire.*

WIGTONSHIRE.—Not for many years have the fruit-crops been so light as this season. Apples, Pears, Plums, and Cherries are, throughout this district, the worst on record, very many of the trees being fruitless. Fig-trees on walls have a fair crop of fruits. Gooseberries are slightly below the average; while Currants and Strawberries are satisfactory both in quantity and quality. *James Day, Galloway House Gardens.*

2, ENGLAND, N.E.

DURHAM.—The blossom of all kinds of fruit crops were very promising, but owing to the late frost the fruits on Apple and Pear-trees dropped. Black Currants, although not in flower at the time of the worst frosts, suffered the most. Red Currants are satisfactory, and Raspberries now in flower are full of promise. There are very few Apples and Pears, we having suffered greatly from east winds, which also has damaged their foliage. *R. Draper, Seaham Hall Gardens.*

— The fruit crops in the North are the poorest that I have known during an experience of more than forty years. The severe frosts in April and May destroyed the blossom on Apples, Pears, Plums, and Currants. The Strawberries escaped, and the crop is a very abundant and fine one. *James Noble, Woodburn Gardens.*

NORTHUMBERLAND.—Taken on the whole, this is one of the poorest fruit seasons for some years in this district, the cold, ungenial spring weather so long continued being deadly in its effects on Apples and bush fruits. Strawberries are a fairly good crop, the district being a somewhat late one for this fruit. A large acreage of Strawberries is grown for market. *George H. Ackroyd, Howick Hall Gardens.*

YORKSHIRE.—The present season will long be remembered in this district for the scarcity of fruit, as, with the exception of Strawberries, Gooseberries, and Raspberries, there is nothing. Apples and Plums are quite a failure; a few Pears; a few Cherries; Black and Red Currants a poor crop, and in many gardens none. At Birdsall, Strawberries have been good but much damaged by rain; the small preserving varieties, Grovend Scarlet and Black Prince, had heavy crops, which were gathered in good condition. Royal Sovereign stands rain badly; President and Gunton Park are very good, the latter being one of the best varieties. A redeeming feature in this bad season is the beautiful appearance of the Loganberry, the plants of which are rich in fruit. The trees are suffering more from the effects of last summer's cold and unseasonable weather than from late spring frosts. Apples, Plums, Cherries, and Pears did not mature the wood. *Bailey Wadds, Birdsall Gardens.*

— The fruit crops in this portion of Wharfedale are most disappointing. Apples, Pears, Plums, and all other stone-fruit are very scarce, much blossom being damaged by the late spring frosts. Amongst small fruits, Black Currants are very poor indeed; Gooseberries are in some instances very good; in some cases the Strawberry crop is very heavy, as in this garden. Amongst the varieties which do well here I may mention Royal Sovereign, King of the Earlies, President, Leader, Vicomtesse H. du Thury, Latest-of-All, and La Grosse Sucrée. Blossom on fruit-trees was very scarce indeed; many old Apple-trees which usually carry heavy crops had not a blossom, doubtless owing to unripened wood, the result of the sunless autumn of 1902. Fruit suffered very greatly through the great gale which occurred in the early part of July. *John Snell, Farnley Hall Gardens.*

— The fruit crop here is a complete failure, with the exception of small fruits, which were an average crop. Nothing could have withstood the severe weather we had in this locality in the spring, even with more than ordinary protection afforded. Our Peaches under glass protector and four folds of herring-net were stripped clean after the flowers were well set. We had twelve successive nights of frost in April, culminating on the 26th with 17° of frost. We have no Pears, Peaches, Apricots, or Plums. Apple-blossom, although not open, was cut off at the stalk, and very few were left unhurt. The standard trees in the orchard have none on; the crop of Quinces

was destroyed and the trees very much crippled. The following are a few Apples with a few on (they are bush and espalier):—Grenadier, King of the Pippins, Beauty of Kent, Domino, Cox's Pomona, Suffield, Jas. Grieve (full crop), Peasgood's Nonsuch, Potts' Seedling, Lord Grosvenor, Lady Elizabeth de Faby, and Cellini (full crop). *Charles Simpson, Newby Hall Gardens.*

— The fruit crops are very unsatisfactory, much worse than last year; indeed, there are scarcely any Apples, Pears, or Plums. The trees bloomed very irregularly, the frosts and biting winds destroying what bloom there was. Plums appeared to set well on the walls, but most of them dropped off when about of the size of large Peas. Morello Cherries, generally a good crop hereabouts, have failed. Strawberries, Gooseberries, and Raspberries are our best crops this year. Fruit-trees generally were very late in starting into growth, and many varieties have made but little wood. Stone fruits are much infested with aphides. *J. S. Uper, Wigganhorpe.*

— With the exception of Strawberries, Gooseberries, and Apricots, there is, practically speaking, no fruit in this district. It is without doubt the leanest year since 1879. I do not think that the whole cause of this scarcity is attributable to the very ungenial weather during the blossoming period. The previous summer and autumn were very dull and sunless, hence the fruit-buds were imperfectly formed. Speaking generally, Apple, Pear, and Plum-trees have made healthy growths. We have had ample rains to reach the deeper roots. If we can but have a fair amount of sunshine now onwards until autumn there will be good hopes of fine crops next year. *Henry J. Clayton, Grimston Gardens.*

3, ENGLAND, E.

ESSEX.—The very unpropitious weather which prevailed during the whole time that Pears, Plums, and Apples were in flower is responsible for the crops of those fruits—if crops they can be called—for the year 1903 being the very worst experienced in this county for many years past. In fact, as regards trees growing in the open, the crops are a complete failure. Bushes of Black Currants and Gooseberries, as well as Raspberries and Strawberries, bore excellent crops of fine fruit. *H. W. Ward, Lime House, Rayleigh.*

LINCOLNSHIRE.—I do not remember such a poor fruit crop. Sharp frosts and cold biting north and north-east winds in April destroyed nearly all the blossom of the Peach, Nectarine, Pear, Plum, and all the early flowers of the Cherry-trees; and as if this was not bad enough birds, hüllfinches, sparrows, &c., made sad havoc with the Apple-blossom, a later frost completing the destruction. I do not think there will be half a stone of Apples in the gardens here. Strawberries have been a good average crop, and with nice weather at ripening time have been very good. Gooseberries furnish the only other satisfactory crop. *H. Vinden, Harlaxton Manor.*

— The fruit crop on the whole is, in this district, a complete failure. The trees at first promised well, but owing to the late spring frosts, especially those occurring between April 12 and 18, when from 3° to 10° were registered daily, accompanied by N.E. winds and snowstorms, all blossom was destroyed. The Plum-trees are making poor growth, and they are much overrun with insect-pests. Pear and Apple trees are cleaner, but they are almost devoid of fruit. Small fruits are also disappointing, with the exception of Strawberries; the latter show average crops of superior quality. During the twenty-four years I have been in these gardens I have never had such a scarcity of outdoor fruits. *John Rowlands, Minor Gardens, Bardney.*

NORFOLK.—The great scarcity in most fruit crops this year is due to the disastrous frosts of mid-April. Peach and Nectarine trees suffered very much, being in some places completely crippled. In some gardens there are good crops of fine quality. The same remarks apply to Cherries. Black Currants are very scarce. Red Currants and Gooseberries have in some gardens good crops of fruits, and of Raspberries the crops are heavier than usual. Strawberries are a good crop, but deficient in flavour, and the fruits have rotted in large numbers. On the whole, the season is the worst we have had hereabouts for very many years. *E. C. Parslow, Shadwell Court Gardens, Thetford.*

SUFFOLK.—Taken as a whole, the fruit crop in this district is one of the worst that I can remember. Of Pears and Plums there are scarcely any. Cherries, a very partial crop and much under the average in quantity. Great numbers of Apple-trees round about are quite destitute of fruits, and this without regard to variety. The Gooseberry and Currant crops are an extremely poor crop; Strawberries and Raspberries are the only good fruit crops we have. All this scarcity results from the ten frosty nights which occurred between the 8th and 25th of April. *J. Wallis, Orwell Park Gardens.*

SUFFOLK.—The fruit crops in this district are very disappointing. There was an abundant blossom on all kinds of fruit-trees in the spring, but the continual frosts from the first week in April till nearly the end of the month destroyed the blossom and young fruit, and all hopes of a fruitful year. The crops of Peaches and Nectarines are variable; in some places the young growth was injured by frost, so much so that the trees are crippled and apparently quite beyond recovery. In other places around the trees are in good condition, carrying a fair quantity of fruit. The fruits on Pear, Apricot, and Cherry trees are few. Strawberries are plentiful and very good, but small fruits generally are a partial crop. *H. Fisher, Bungay.*

(To be continued.)

THE FLOWERING OF HARDY BAMBOOS.

NEARLY all over Great Britain and Ireland some or other of the hardy Bamboos are flowering this year. So far the only two species I have noticed are *Arundinaria Simoni* and *Phyllostachys nigra*, which have also flowered during recent years at Kew and Batsford Park, whence we have a seedling of both species reared from home-grown seeds. The profusion with which *A. Simoni* is now not only flowering, but fruiting, in the Trinity College Gardens at Dublin is well shown by the fertile culms I send herewith. The seeds or fruits are nearly naked, and resemble very fat and heavy Oats, but are larger and more glossy. When the fruit approaches maturity the fruiting branches easily disarticulate themselves just below the fruit, which falls to the ground if wind or other natural agencies should disturb the culms.

It was formerly believed that when Bamboos flowered they invariably died after ripening the seed. In some cases this is probably true, as observed in India and elsewhere; but Lord Redesdale informed me some time ago that in the case of *A. Simoni* this does not usually take place, and that, although the clumps look very brown and miserable for a time, young leafy shoots again appear from the stout, Couch-grass-like stems that run about underground.

I hope that growers of these woody or shrubby grasses will look at their plants carefully, and especially note any other species that may now be showing flowers in British gardens. Their dry-looking or shabby appearance is usually an

indication of this taking place in the case of large and long-established clumps, but, of course, not with small and newly-planted specimens. This wave of flower and fruit-production seems likely to lead to *A. Simoni* and *P. nigra* being reared by the thousand from home-saved seed, and if so, the result may be that these two robust kinds will find their way into our woods and game-covers, and that they will naturalise themselves in warm localities and climates. Another result, if the various kinds flower and fruit in close proximity, may be that hybrids may be produced in our Bamboo-gardens, as is supposed to have been the case in Japan, China, and elsewhere in the past.

The whole subject is a very interesting one, and the views of others who are fond of these fresh and graceful evergreen grass-shrubs is much to be desired. The "dehiscence" of the fruiting branches, so as to allow the mature fruits to fall or sow themselves, should be noticed. The light crest of male or abortive flowers remains attached, and would be blown some distance during rough winds or gales. *F. W. Burbidge, Dublin.*

The Week's Work.

FRUITS UNDER GLASS.

By T. H. C.

Melon-house.—Where late Melons are appreciated, plants should now be planted to ensure ripe fruit during October. Provide a bottom-heat of 80° to 85°, a night temperature of 70°, and by day 10° to 15° more. If large pots are preferred to beds of soil, fill them firmly with a compost chiefly consisting of loam, and plunge in a hotbed of stable-manure and tree-leaves, and set the pots on pedestals of bricks. Let the Melon-house be thoroughly cleaned before putting fresh Melon-plants into it. The compost of a Melon-bed may consist of good loam, a small quantity of charred garden refuse, and mortar rubble, which form into hillocks 3 feet apart, on which put out the young plants when ready, making the soil firm round about them. A loose soil tends to make soft, long-jointed growths, susceptible to disease and to insect-pests. Apply water sparingly till the roots are running freely in the soil, and apply no manure before an even set of three fruits to a plant has been secured. Maintain moist conditions in the house, being guided in this matter by the weather, shorter days, and the smaller amount of sun-heat, remembering that much humidity does not tend to fruitfulness. Afford air in favourable weather, and close early with sun-heat whenever it can be done. Plants raised early in last month, which have been recently planted, should have the points of the main shoots pinched out when these have grown to within eighteen inches of the top of the trellis, and train the side growths thinly, stopping them at one joint beyond a fruit. While the fertilisation of the blooms is proceeding, afford a dry condition of the air with much ventilation. The degree of warmth at night may reach 70°, and by day 80° to 85°, with ventilation when the weather is favourable, reducing it as the sun declines, and closing with the thermometer at 90°. Syringe the plants once or twice a day, and maintain a moist condition of the air in the house.

The Cucumber.—Seeds may be sown about the middle of the month for raising plants for fruiting in the winter. In doing this place one sound seed $\frac{1}{2}$ inch deep in the centre of a 3-inch pot, in a mixture of loam and leaf-mould. Plunge the seed pots in a propagating pit in brisk bottom heat, and when the seedlings are got above the soil place the pots on a shelf close to the glass, and keep the temperature at 70°. Telegraph and Cardiff Castle are two capital varieties to sow now. Plants recently planted out should have the points of the bine pinched off when halfway up the trellis. Take measures against red-spider. In order to prolong the fruitfulness of plants, apply a top dressing, and repeat this when the roots appear again at the surface. Remove the old bine and such leaves as are not in a sound state or that may cause crowding, and

lay-in young shoots. Generally carry out the course that has been given with regard to Cucumber culture from time to time.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq. Droghere, Maidenhead.

Peach and Nectarine trees.—Growth being very vigorous at about this date, the training of the leading shoots and the removal of all lateral shoots not needed must receive constant and regular attention. Any leading shoots taking the lead to the detriment of others should have the points pinched out, and in the case of very strong shoots, cut them back to the lowest sub-lateral shoot, and train-in that one as the leader. Only by adopting such means can a well-balanced tree be formed. The mid-season Peaches and Nectarines are now ripening, and the leaves which may be shading the fruits should be pushed on one side. Keep a sharp outlook for black aphid, dipping the points of the shoots where these pests most do congregate into a weak mixture of quassia extract and soapy water.

Strawberry-beds.—Plants layered early in July are now ready for being taken up and planted. The recent rains have made the ground in good condition for planting, and if the same has been prepared for them, the work may proceed apace. Royal Sovereign, The Laxton, and James Veitch are varieties of strong growth, and the rooted runners should be planted 2½ feet apart each way, and for less robust growers 2 feet will afford sufficient space. Layering runners should terminate forthwith.

Hints on Work in General.—At the present time take note of trees which require to be root-pruned later on. With the light crops of fruit now very general in gardens and orchards, most trees are growing with extra vigour, but if root-pruning is generally practised no large number of fruit-trees will require this sort of attention, excepting such as have been newly planted and have not borne a crop. Apples on the Paradise and Doucin, and Pears on the Quince stocks may need root-pruning, as well as standard Apple-trees on the Crab, if not very aged. The early Apples, Irish Peach, Mr. Gladstone, and the red-and-white Juneating, should be protected from blackbirds and thrushes this season, and if the number of fruits is few they may be put into muslin or scrim canvas bags, or a net can be put over the trees. These early varieties of Apples are better gathered straight from the trees as required for dessert, as the fruits lose flavour if stored.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE Bioton, Budleigh Salterton, Devonshire.

Freesias.—No greenhouse should be without these lovely Cape bulbs. Those having a stock should shake them out of their pots, if this be not already done, sorting out the finest bulbs, and placing six or eight in a 5-inch pot, covering them with an inch of soil, consisting of loam, leaf-soil, a small quantity of decayed manure, and enough sand to give porosity. Stand in a cold pit or frame facing north, and unless the soil is very dry, afford no water for a week or ten days, but cover the lights entirely with mats in preference to cocoa-nut fibre or leaf-soil, which, if not carefully watched, is liable to cripple the grass-like shoots as they push up. Apply very little water until actively growing. *Ixias* and *Sparaxis* require similar treatment as regards potting, which, however, need not be carried out till the middle of September. The smaller bulbs grow to flowering size if grown for one year with the remainder.

Lachenaliums.—To many persons these plants appear a little bit formal, but they are nevertheless a useful class for blooming during the month of April or early in May. They respond to the same kind of treatment as that described above; or if it be intended to make up baskets for hanging, place them in pans or small boxes until growth is an inch long, then transfer them to the baskets, dibbling them fairly thick all round the sides, which should be first lined with moss to prevent the soil being washed out. The varieties *Nelsoni*, *pendula*, and *tricolor* are the best to grow.

Hyacinths, &c.—The early white Roman Hyacinths for flowering early in December require to be well rooted before they are introduced to the forcing-house, and should be potted up early in the present month, placing three or four bulbs in a 5-inch pot, or, if for cut flowers, plant in cutting boxes, transferring them to pots just as the flowers begin to expand, if that be thought necessary. In potting do not press the soil under the bulbs too firmly, or they will push themselves out. The White Italian forms a good succession and has a much finer spike, it is also very fragrant. The named varieties carry on the flowering well into the month of April if the bulbs are potted during the next two months. Among Tulips the earliest are the Duc van Thol varieties, and the following are much finer and force well—Pottebakker (white), Belle Alliance, L'Immaculée, Cottage Maid, Goldfinch, and Montrésor.

The *Polyanthus Narcissus* (Paper-white) should also receive early attention, while several of the Daffodils come early into flower with very little forcing, viz., Princeps, Ard Righ, Horsfieldi, Cynosure, Countess of Annesley, and Golden Spur. Place the pots of bulbs behind a north wall or in a cold frame, and cover with fine coal-ashes or sifted leaf-soil.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury.

Mexican Lælias.—*L. autumnalis*, *L. albida*, and *L. Gouldiana*, being sun-loving subjects, are the better for being grown in baskets, and hung up close to the roof of the house. These Lælias are injured by disturbance at the roots, and should not be turned out unless they have become overgrown. The old materials should then be replaced with new, if this be found necessary, when action at the root has commenced. Abundance of water at the root is necessary when the plants are in active growth, and syringing on the afternoons of bright days. Let the shading be removed early, and allow the temperature to rise considerably by sun-heat. The ventilators may be opened during the night, if the weather be warm and fine. If the Lælia-house is light and airy, these plants will form good, hard pseudo-bulbs and strong flower-spikes.

Lælia majalis is a beautiful species, but is difficult to grow and flower satisfactorily in gardens, owing to its natural habitat being at a great elevation above sea-level, and it requiring much cooler conditions than the foregoing plants; moreover, the plant should have the maximum of sunlight.

Lælia crispata is a pretty species now flowering in the Cattleya-house at Westonbirt. The plant is a rather shy flowerer in some gardens, which I attribute to affording it too much heat and an excess of water at the root, with the result that the plant is always growing, and never sufficiently matures its pseudo-bulbs. The plant requires but a small quantity of water at any season; and a light position in the warmest part of the Cattleya-house should be chosen for it. The most suitable season for repotting is early spring, and overpotting should be guarded against, pot-bound plants always affording the most flowers.

Cattleya El-dorado and *C. E. alba* are making a show at this season, this flower coming before the growths are fully developed, and new roots are often emitted before the latter stage is reached. Repotting and top-dressing when needed should then have attention, making use of well-drained pots or pans and the usual Cattleya compost. Keep the plants moist at the roots till the pseudo-bulbs are fully developed; then place the plant at the coolest part of the Cattleya-house for resting, and afford much less water.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PIGOTT, Bart., Wexham Park, Slough.

Winter Onions.—A sowing should be made about August 11, and again a fortnight later, on a south border. A piece of ground should be selected for the first sowing which has been deeply dug and well dressed with soot and wool-

ashes; and if the land be heavy apply a heavy dressing of road-grit. Make the ground firm by trampling it evenly, then draw shallow seed-drills 10 or 12 inches apart, and sow evenly and thinly, covering the seeds with soil with the fork, finishing neatly with a rake. Red Rocca, White Emperor, and White Leviathan are good varieties for present sowing. The last-named is a splendid Onion for pulling early, and the bulbs, if left in the ground, will grow to a very large size. It is a bad keeper.

Carrots.—A sowing may be made in a frame or on a south border, sowing the seeds thinly in drills drawn at 10 inches apart. As soon as the seedlings are large enough to handle, they should be thinned at a little distance apart. Veitch's Model, Sutton's Scarlet Intermediate, and the Scarlet Horn, are suitable varieties for present-sowing.

Potatoes.—Those that are ripe should be dug up without waiting for the haulm to die down. The continued wet weather has been most injurious to tubers fully grown, and it is better to lift them too early than to leave them any longer in the ground to be attacked by disease. Choose, if possible a dry day for lifting.

Cauliflowers.—Heads are turning-in for use in abundance, and the heads should be covered by breaking the inner leaves over them. Keep a sharp look-out for caterpillars, and collect them by hand. Stir the ground well between succession plants, destroying weed and promoting growth.

Cardoons.—The stems take about ten weeks to blanch properly, and a commencement may now be made, tying up the leaf-stalks together temporarily, and wrapping and enclosing them in stiff brown-paper and hay-bands, finally banking-up the soil about the plants.

General Hints.—Ply the hoe carefully amongst all growing crops of all sorts. The recent rains have been a hindrance to the destruction of weeds, and when the hoe cannot be used, hand-weeding of the larger weeds must be adopted, or the growing crop of weeds will choke the crops and render much labour necessary later in the season.

THE FLOWER GARDEN.

By J. C. TALLACK, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

Propagation of Bedding Plants.—These operations will now demand attention; first of all, zonal Pelargoniums, the stock of which should be thoroughly established in pots or boxes before winter sets in. Growth has been slow and uneven this summer owing to the unfavourable weather, but most of the plants will afford a cutting or two without injury to the beds, if care be taken in the operation. Let the cuttings be made from short-jointed, firm wood, and having trimmed them, insert them 3 inches apart and 1 inch deep in a well-drained, sandy mixture of the accumulations from the potting-bench, &c., to which some leaf-mould is added. Afford the cuttings water copiously, and put the boxes, &c., in a sunny position on a bottom impervious to worms. If they can be so placed that heavy rains may be warded off with spare lights, the result will be good; but until the cuttings have made roots but little water should be applied. In fine weather expose the cuttings to the air and to night dews. Other plants of which it will be advisable to take cuttings now, either to grow on or to use as stock plants for spring propagation, are *Petunias*, *Fuchsias*, *Tropeolums*, *Heliotropes*, *Gazanias*, and *Verbenas*. All of these may be very readily struck in frames placed on nearly spent hotbeds, the cutting-pots being half plunged in coal-ashes and kept close and shaded for a few days, syringing the cuttings once or twice a day.

Lilium candidum.—This, the old favourite "Madonna" Lily, will now be in the best condition for transplanting or, at least, for lifting. In the few cases where the plants have hitherto been disease-proof they may be transplanted at once, but where the disease has been prevalent let the bulbs be dried in the sun under glass for a few weeks; and as a further precaution dress the bulbs before planting with flowers-of-sulphur. Bulbs that are already well placed and growing satisfactorily should be left undisturbed.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUG. 8	{ Royal Botanical Society's Meeting.
MONDAY, AUG. 10	{ Royal Botanical Society's Annual Meeting.
TUESDAY, AUG. 11	—Half-Quarter Day.
WEDNESDAY, AUG. 12	{ Bishop's Stortford Horticultural Society's Show.
THURSDAY, AUG. 13	{ Taunton Dean Horticultural and Floral Society's Exhibition.

SALES FOR THE WEEK.

FRIDAY NEXT—

Great Sale of 18,030 Imported *Odontoglossum crispum*, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.30 o'clock.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick —62°.

ACTUAL TEMPERATURES:—

LONDON.—August 5 (6 P.M.): Max. 68°; Min. 53°.

August 6 (Noon): Slightly overcast at times; 55°.

PROVINCES.—August 5 (6 P.M.): Max. 65°, East Coast; Min. 53°, N.E. Scotland.

Cacti, &c.
(See Supplementary Illustration).

THE meeting of the Royal Horticultural Society in the Drill Hall, Buckingham Gate, Westminster, on Tuesday last,

was the thinnest and most meagre of the season. Notwithstanding, it contained many features of interest, notably in the collections of Cacti which were specially invited. There were two collections in particular that attracted attention, viz., that of Messrs. CANNELL, of Swanley, and of Mr. ANKER, the agent for M. DE LAET, of Contich, whose nursery was lately noticed in our columns. Messrs. CANNELL showed large well-grown specimens, among which *Echinocactus Grusoni* was specially noticeable.

Two remarkable Mesembryanthemums, each with a pair of succulent green leaves (*M. Bolusii*, *M. truncatellum*), were remarkable from the close resemblance they would have in their native wilds to the rocks and stones among which they grow—a resemblance which would ensure them a certain measure of protection from browsing animals.

The densely-set spines of various Cacti and Euphorbias serve a similar purpose. The provision against drought in a dry and thirsty land is effected by the tough rind, which checks undue evaporation, and by the storage of water in the bloated stems. It is the recognition of these wonderful adaptations, no less than their variety and grotesque appearance, which give these

plants a special charm to some people. The ordinary observer is apt to say he does not like them because they do not grow, and change their aspect from day to day or month to month. Cactus lovers will, of course, not admit that, but it is only a matter of the seeing eye. When they are in flower, however, it will be universally admitted that not a single group of plants can produce a more gorgeous effect. "Gorgeous" is the only adjective that can adequately describe the crimson glories of many flowers of the genus *Cereus*, while among the *Echinocacti* and the delicately tinted *Phyllocacti*, there are many almost equally beautiful; many of the tiny *Mamillarias* also produce a striking effect by the brilliancy of their crimson berries, as was shown in some of the specimens on Tuesday last.

Among the whole group there is none more wonderful or more beautiful than the night-blooming *Cereus*, of which we give an illustration in our supplementary plate, taken, as we suppose, by the aid of the magnesium light. The snake-like stems are somewhat uncanny, but words are not adequate to describe the glories of the expanded flowers, with their outer segments of cinnamon-brown passing gradually through cream-colour to snow-white, and with crowds of delicate white, thread-like stamens moving gradually around the projecting style. And then the perfume! It is like the most fragrant of incense. If one saw but one flower in the year, and that flower were one of the night-blooming *Cereus*, it would remain as a vision of beauty and a wonder of wonders for many a long day. Of course, such a flower cannot be exhibited in the Drill Hall, and it is not of any use as a cut-flower for decorative purposes, and so we suppose many would pass it by; and we should not be very much surprised, judging from past experience in similar cases, if the Floral Committee ignored its title to a First-class Certificate, if it could be brought before them.

The Cacti by no means formed the only things worth seeing; there were Roses and Lilies, and Orchids and Poppies—a delightful exhibit; and there was a fine display of the magnificent *Senecio elivorum*, illustrated in our columns September 20, 1902; so that although the display was much smaller than we are accustomed to see, it was by no means deficient in interest.

Among the distinguished visitors were Sir THOMAS HANBURY, the owner of the noble garden at La Mortola, and Mr. J. H. HART, the well-known colonial botanist from Trinidad.

Mr. MILNER, who had been advertised to lecture on Landscape Gardening, was unfortunately unable to be present, to the great disappointment of many anxious to hear him.

THE IRISH GARDENERS' ASSOCIATION AND BENEVOLENT SOCIETY, DUBLIN.—The following is a copy of an address presented to H.M. the KING at Dublin Castle on July 22, 1903:—

To His Majesty EDWARD VII., King of Great Britain and Ireland, Emperor of India, &c.

May it please Your Majesty,—

We, on behalf of the Irish Gardeners' Association and Benevolent Society, beg to tender to Your Most Gracious Majesty, and to your illustrious Consort the QUEEN, our

most loyal and hearty welcome on this your first visit to Ireland since your Majesties' accession to the Throne.

Representing as we do a large body of your loyal subjects, who appreciate the great interest your Majesty takes in the welfare of those engaged in Horticultural pursuits, and in honouring with your Royal patronage the Gardeners' Royal Benevolent Institution and the Gardeners' Royal Orphan Fund of England, whose objects are of a similar character to our own, we feel that the present is a fitting opportunity to express our sincere gratitude and profound respect on this occasion of your visit to Dublin; and we humbly hope and pray that it may be your Majesty's gracious pleasure at some future date to honour with your illustrious patronage the Irish Gardeners' Association and Benevolent Society. Signed on behalf of the Society:—

President, F. W. BURRIDGE, M.A., M.R.I.A., V.M.H.

Vice-Presidents, JOHN J. EGAN, J.P., JAMES CAVANAGH, F. W. MOORE, A.L.S., M.R.I.A., V.M.H.

Hon. Secretary, WM. S. HALL.

ROYAL HORTICULTURAL SOCIETY: EXHIBITION OF BRITISH-GROWN FRUITS AND VEGETABLES, SEPTEMBER 29, 30, AND OCTOBER 1.—The Royal Horticultural Society will hold an exhibition of British-grown fruits and vegetables at Chiswick on September 29, 30, and October 1. The Prize Schedule is now ready, and contains in addition to the list of prizes an authoritative list of dessert and culinary Apples, Pears, and Plums. Special prizes are offered for preserved and bottled fruits. A conference on Vegetables will be held on Tuesday, September 29, at 2.30 P.M., Mr. G. BUNYARD, V.M.H., in the chair. The following gentlemen have been asked to read papers:—1. "On Cooking Vegetables," Dr. BONAVIA and Mr. JAMES HUDSON, V.M.H.; 2. "On Vegetables All the Year Round for a Private Family," Mr. W. H. DIVERS; 3. "On Vegetables for Exhibition," Mr. EDWIN BECKETT; 4. "On Vegetables for Market," Mr. W. POUPART. Any contributions to the conference will be welcomed. Donations towards the Prize Fund will be gratefully received by the Secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W., of whom copies of the Schedule can be obtained. Applicants should enclose a stamped envelope ready addressed to themselves.

"BOTANICAL MAGAZINE."—The August number contains coloured figures and descriptions of the following plants:—

Isoloma erianthum, Decaisne, t. 7,907.—A Gesneriaceous plant, native of Columbia, with shaggy hairs, lanceolate leaves, and loose clusters of irregularly-tubular flowers, yellow flushed with red, and each about 1½ inch long. The rhizome is covered with thick, fleshy, pinkish scales. It is a handsome stove plant. Cambridge Botanic Garden and Kew.

Sedum Stahlitii, Solms, t. 7,908.—A Mexican species, with thick, oblong leaves and a spreading cyme of yellow flowers.

Chloraea longibracteata, Lindley, t. 7,909.—A Chilean terrestrial Orchid, lately mentioned in our columns when speaking of Orchids at Kew.

Arisæma japonicum, Blume, t. 7,910.—A species with pedately divided leaves and green spathes striped with white. It flowered in the Alpine-house at Kew.

Cistanche violacea, Desfontaines, t. 7,911.—A plant allied to our Orobanches, and parasitic on various plants. It has a thick, fleshy stalk

covered with dense, overlapping, fleshy scales, and a terminal inflorescence of numerous violet-coloured flowers, like those of an *Orobanche*.

"**FLORA OF HAMPSHIRE.**"—Mr. TOWNSEND is about to publish a second edition of his valuable *Flora of Hampshire*. No fewer than fifty additional species will be included, exclusive of *Rubi*.

MR. GODEFROY LEBEUF, of Paris, importer and grower of Orchids and of colonial and economical plants, and author of the *Orchidophile*, died on Sunday last, aged 51 years.

HOFRATH PROFESSOR CARL HAUSKNECHT.—This well-known botanist, founder and president of the Botanical Society of Thuringia, died at Weimar, July 7, in the sixty-third year of his age.

SCHOOL OF GARDENING.—At the Gardens, Regent's Park, Mr. C. BRINSLEY MORLEY, Vice-President, one afternoon of last week presented certificates to those students of the Royal Botanic Society's School of Practical Gardening who had successfully passed the Technical Education Board's examination in botany for intermediate scholarships. He congratulated Miss VERRALL on having obtained 276 marks out of a possible 300. Miss SADLER also had passed very creditably. In all thirteen certificates were awarded, of which six were taken by ladies.

THE ROTHAMSTED EXPERIMENTAL STATION.—The Station was visited, on July 31, by the Rt. Hon. The Earl of Onslow, G.C.M.G., President of the Board of Agriculture, who was accompanied by Sir T. H. Elliott, K.C.B., Secretary to the Board of Agriculture, and by Mr. Pakenham, his private secretary. Other gentlemen present included G. Lambert, Esq., M.P., A. H. Smith, Esq., M.P., G. B. Hudson, Esq., M.P., Martin J. Sutton, Esq., H. Hodge, Esq., Professor W. A. Tilden (President of the Chemical Society), and H. T. Hodgson, Esq. They were met by Sir Charles Lawes-Wittewronge, Bart., and by Sir John Evans, K.C.B., F.R.S., Sir Michael Foster, K.C.B., M.P., and Dr. Armstrong, LL.D., F.R.S., Members of the Lawes Trust Committee. Mr. A. D. Hall, M.A., the Director, conducted the visitors through the Laboratories and over the Experimental Plots. Other recent visitors to the Station have included a party of about twenty-five teachers from the Royal College of Science, South Kensington, accompanied by Professor J. B. Farmer, on July 17, and a small party, on July 21, from the Horticultural College, Swanley, Kent.

PERFUME IN PLANTS.—Messrs. CHARABOT & HERBERT show that the proportion of perfume-giving elements in a plant may be increased by the use of mineral manures, which at the same time facilitate transpiration, and thus diminish the amount of water in the plant. The conclusions are given in the *Comptes Rendus* for June 29.

PELORATE ANTIRRHINUM.—Mr. LINDSAY sends us from Edinburgh specimens of regular peloria in the common *Antirrhinum*. The flower-tube is straight, cylindrical, uniformly dilated at the base, but with no trace of spur; the limb shortly 5-lobed, regular, not in the least two-lipped, with a ring of white hairs in the throat, in which the pollen grains are entangled, so that an insect visiting the flower must needs brush some of them off and carry them away with it. The five stamens are of equal length. If any unfortunate student described this as a Solanaceous plant, and not one of the Scrophulariaceæ, he might, in the absence of ripe seeds, be acquitted. The abnormality, or rather the reversion to primitive normality, is so far fixed that seeds sent by Mr. LÖRBNZ, of Erfurt, reproduce

this form of flowers without fail. This is a greater change than those relied on by Prof. DE VRIES in his mutation theory to substantiate the formation of new species in *Ethiopia*, for here we have not merely different specific but ordinal characters developed. In any case, this peloric *Antirrhinum* may be invoked as evidence tending to prove that the irregular Scrophulariaceæ are the modified descendants of the regular Solanaceæ, just as *Lobelia*s are irregular forms of *Campanulas*, *Orchids* of *Apostasias*, and so forth.

EUCALYPTUS.—As if the species were not difficult enough to determine, Dr. TRABUT describes and figures, in the *Revue Horticole* for July 16, various plants, supposed with more or less reason to be of hybrid origin, viz., *E. Rameliana* ×, a cross between *E. botryoides* and *E. rostrata*, *E. gompho-cornuta* × between *E. gomphocephala* and *E. cornuta*; *E. Bourlieri* ×, a hybrid between *E. globulus* and an undetermined species. It is surmised that some of these hybrid forms may prove better adapted to the conditions of the Mediterranean climate under which they originated than the introduced species.

SOUTH AFRICAN ALOES, ETC.—We have received a copy of Dr. SCHÖNLAND's paper on the species of *Aloe* native to South Africa. Hitherto, our knowledge of these plants has been principally obtained from cultivated specimens, which differ in character from the wild forms. Moreover, the specimens being troublesome to preserve, the species are not so well represented in herbaria as they ought to be, and in many cases the exact locality where particular specimens have been obtained is not indicated. Some of the characteristics vanish or are much modified in the drying process, so that the careful study of living plants in their natural habitats or under natural conditions is greatly to be desired. We may here note that the specimens prepared for the Kew herbarium by Mr. N. E. BROWN, from garden plants, are of great excellence. Dr. SCHÖNLAND has undertaken the task of examining the wild species, and the first-fruits of his researches are published in the *Records of the Albany Museum*, vol. i., No. 1 (April, 1903). Botanists and cultivators alike will be under obligations to Dr. SCHÖNLAND, whose papers will, we hope, be widely circulated. Incidentally we may mention that the author has succeeded in procuring good herbarium specimens by soaking the plants for a few days in a strong solution of Cooper's Sheep-dip, and then pressing the specimens in the ordinary way, with frequent changes of paper.

PALMS IN THE RIVIERA.—M. ROBERTSON-PROSCHOWSKY, whose communications to our columns have been so much appreciated, has contributed to the *Bulletin of the Société Nationale d'Acclimatation de France* a paper on certain Palms adapted for cultivation in the open air in the climate of Nice. Among them he enumerates species of *Chamædorea*, which require partial shade. One species, *C. geonomiformis*, has produced fertile seeds. *Glaziova insignis* and *G. Martiana* (*Cocos Weddelliana*) are both hardy. Various species of *Howea* or *Kentia*, of *Kentiopsis*, also sustain the climate of Nice, as does *Livistona chinensis* (*Latania borbonica*), but must not be exposed to the full sun, as under those circumstances it is liable to be injured by frost. For an enumeration of the other species mentioned by M. PROSCHOWSKY we must refer to the original paper.

MEDICINAL PLANTS.—The following report on medicinal plants for 1903 has been received from Messrs. RANSOM & SON, Hitchin:—*Belladonna*.—The early plant was injured by the late frosts, and although it has now mostly recovered it is shorter than usual, and the quantity will be less than last year. *Henbane*.—The crops are very irregular this season. In places it is almost

a failure, while in other situations it is abundant. Altogether it appears to be more plentiful than last year. *Lavender*.—The plants are looking healthy, but the flowers are very irregular. With favourable weather for harvest the prospects should be fairly good. *Peppermint*.—This is not likely to be abundant, the plants being thin. *Rosemary*.—The plants are in fairly good condition, and the crop will probably be about up to the average. *Elaterium*.—The prospect is not so good as usual. The heavy rains, followed by the hot weather, have not been favourable for healthy growth. *Aconite*.—The plants are in good condition, and an average crop may be anticipated. *The Pharmaceutical Journal*.

INTERNATIONAL EXHIBITION IN MANCHESTER.—It has been determined to hold an international exhibition in Manchester in 1905. Land for the purpose is found available, and funds can be raised. The scope of the undertaking "will comprise all that is best in industries, arts and sciences, home, colonial and foreign," so that our friends are at least aiming high. At present the programme is, of course, general rather than detailed, and there seems good reason (and the Committee have no doubt) that it should be an unqualified success.

THE PRESERVATION OF FRUIT BY COLO; "DE LA CONSERVATION DES FRUITS PAR LES PROCÉDÉS BASÉS SUR L'EMPLOI DU FROID."—This is a little pamphlet written by M. LOISEAU, and published at 84 bis, Rue de Grenelle, Paris. It deals with the preservation of fruit in refrigerating chambers, a process now familiar to those concerned on this side of the Channel. M. LOISEAU asks: "Will the fruit so heated keep, and will the necessary expenditure be compensated for by the prices obtained in the market?" To both of these questions M. LOISEAU says, "Yes."

PROTEA MELLIFERA.—In the current number of the *Revue Horticole* is a coloured plate of this noble plant, known in this country, if at all, only under glass. The plant figured is growing in the open air in the nurseries of M. M. NABONNAND, between Cannes and Antibes. We are not aware whether any of the *Proteas* have been tried in the open in the Scilly Islands or other favoured corners of this country, but the inflorescence is so imposing that it would be worth making the trial. Under glass they have gone completely out of fashion, perhaps because they take up too much room, and are not of much use as "cut flowers."

CHRYSANTHEMUMS:—

ANTWERP.—The Royal Society of Horticulture and Agriculture of Antwerp will hold a great exhibition of Chrysanthemums in that city from the 14th to the 16th of November. The address of the Secretary is 9 Longue rue de l'hôpital.

LILLE.—A great Chrysanthemum Congress will be held at Lille from the 6th to 8th November next. Foreign exhibitors will be allowed to participate.

PLAGIARISM.—An Italian writer on the Chrysanthemum is alleged to have translated the work of M. LOCHON, the gardener to the Prince of Bulgaria, and to have affixed his own name to the translation, without mentioning that of the original author!

RUBBER TREES.—"The Jelutong tree (*Dyera Costulata*)," says Mr. Ridley in the *Agric. Bull. of the Straits and Federated Malay States, March*, "is one of the biggest trees of the Malay Peninsula, attaining a height of over 200 feet. It belongs to the order Apocynaceæ, and is allied to *Alstonia*. Its chief use appears to be for making a water-proofing mixture used in the walls, floors, and roofs of houses; and this use, which is of comparatively recent date, appears to be the cause of the very large demand for it of recent

years. It is used also in making all sorts of cheap rubber goods, especially rubber shoes, when mixed with other materials." A figure of the tree with botanical details is given in the publication above mentioned.

THE TRANSPORT OF PLANTS.—There are a few still left among us who can remember the introduction of the Wardian case, and its application to the transport of living plants from country to country as now so largely practised. Now comes the use of the electric light, concerning which the following extract from an article by Sir DANIEL MORRIS in the *Kew Bulletin*, 1891, will be read with interest:—

"Owing to the cold weather, the cases on board the *Atrato* were placed below in the main saloon. There was very little direct light in the day-time, but the question of warmth was, for the moment, of more importance than that of light. The weather during the whole of the first week continued very cold, and it was impossible to expose the plants on deck. Under these circumstances it was fortunate that the electric light, with which every part of the ship was supplied, was available to try an experiment of some interest. Although the plants received very little light during the day, they had a good supply of electric light during the night, and the particular plants that were more fully exposed to the electric light were afterwards found to be in a much better condition than the others. It is well known that plants will thrive under the influence of artificial light, but in this instance there was so little direct light available during the day that the plants had to depend almost entirely on the light they received at night. The Gambier plants are particularly sensitive as regards a diminution of light. In the present instance the plants were placed below on November 12, and were removed on deck on November 19. Here they were placed on a hatchway on the starboard side, and shaded from the direct rays of the sun by an awning. In order to make myself acquainted with the exact condition of the plants before they left my charge, the cases were opened on November 22, about thirty-six hours before arriving at Barbados. All the plants were in good order; a few, it is true, had lost their leaves, but the greater number were in excellent condition. The case in which the plants had suffered most was one of the two intended for the Jamaica gardens. This had been placed with its end towards the electric light, and, in consequence, had received less direct light than the others. The reports received respecting the Gambier plants on arriving at their destination were as follows:—Jamaica, December 1: 'Thirty-four plants in good order, eight in fair order, thirty-eight somewhat weak;' British Guiana, December 3: 'The plants arrived safely, all living;' Trinidad, December 17: 'All the plants arrived safely, the lower portion growing freely;' St. Vincent, December 19: 'Fifteen plants in good order, seven leafless ten dead'—these plants were over-carried by the *Est* to Trinidad and La Guayra, and returned to St. Vincent ten days late; Dominica, November 28: 'The plants arrived in good condition.'

REMEDY FOR MOSQUITO-BITES.—Year by year we learn more of the appearance of that vile insect the mosquito in our country lanes and by river-banks, at one time the undisputed domain of the midge; and nostrums without end are advised for mitigating the discomfort of the sting. But why not checkmate the owner of the boring proboscis? The Entomologist for the State of New Jersey has placed on record the how to do it. The oil of citronella, distilled from *Andropogon nardus*, is the thing; the odour is not unpleasant, and the oil may be lightly applied to the skin of those parts of the body exposed to the conscienceless marauder, keeping it away from the eyes. The reporting entomologist has slept peacefully on an exposed verandah when all others were driven indoors to mosquito-curtains, &c. It has never failed during his collecting rambles—the enemy flies before it!

EDIBLE FUNGI.—With a wet autumn in prospect we may confidently expect a plentiful crop of fungi. Some of these we know to be "good-eating," whilst, as to others, the less we know of them in this particular aspect the better. Nevertheless it is all the more essential to be able to recognise them by sight. We have various works in this country, but none very recent, although the excellent figures by Mr. WORTHINGTON SMITH, in the Natural History Museum,

are invaluable to the student who is fortunate enough to be able to pay a visit to Cromwell Road. Those who have not that privilege, and especially those to whom the French language offers no bar, may like to hear of a small book, in which edible and poisonous fungi are arranged in a series of tables, so that they may easily be determined with a little care—the more so as numerous illustrations both plain and coloured are given. The book is compiled by M. CHARLES MANGET, and is published by J. B. BAILLIÈRE ET FILS, of Paris. It may be obtained at a reasonable price from Messrs. WILLIAMS & NORGATE, or other foreign booksellers.

THE CRICKET MATCH.—The Royal Horticultural Society's Fruit v. Floral Committees' cricket match, arranged to take place at Holland Park, Kensington, on the 8th inst, has, we learn, been postponed.

SALTAIRE, SHIPLEY, AND DISTRICT ROSE SOCIETY.—A society under the above designation has been formed, with headquarters at the Institute, Saltaire, for the encouragement of Rose-culture in Saltaire and neighbourhood. J. ROBERTS, J.P., is President; T. C. BRIDGES, Hon. Treasurer; and Mr. E. WRIGHT, Hon. Secretary. The first show was held in Saltaire Park on July 21 last, which, judging from the report that has reached us, was of a considerable degree of excellence, and well supported by some of the principal rosarians of the country. Doubtless as time goes on and local talent develops, the pick of the prizes for Roses will remain to a greater extent in and about Saltaire, instead of following the strong battalions, as on this occasion.

NEW CUCUMBER DISEASE.—During the past week we have been consulted by an extensive cultivator of Cucumbers relative to a disease which has made its appearance upon mature fruits, and threatens to occasion great loss, as it is not confined to a specimen or two here and there, but appears to be spreading over his crop. This disease forms dark depressed spots on the surface of the fruits in the first instance, which gradually enlarge and expand until they become quite black and convex like nodules, and crack either around or across, exposing the pale understratum. At first they are about a quarter or half an inch across, and finally extend to an inch or 2 inches, or become confluent. The surface is from the first mealy with the conidia, which are afterwards profuse, mixed with slender hyphæ, so as to impart a grey velvety appearance. The earliest conidia are more nearly globose than afterwards, from $10 \times 8\mu$ to $12 \times 8\mu$; becoming at length as much as $25 \times 8\mu$, and then usually uniseptate, but with scarcely any colour; occasionally two or three conidia are concatenate. The hyphæ are long and slender, half or two-thirds the diameter of the conidia, septate, simple, not constricted or nodulose, of a pale smoky colour, and very sparse in comparison to the conidia. The flesh of the fruit beneath the spots turns of a golden or tawny brown. The black elevated spots resemble large scabs, and the parasite which apparently causes the mischief has been called provisionally *Cladosporium scabies* (Cooke). But it is still under cultivation and observation in order to investigate its life-history. The mould is closely allied to the *Cladosporium* which attacks the leaves of the Tomato, but the black blotches resemble those of the *Macrosporium* on the Tomato fruits, except that they are not shining. It is strongly recommended that all diseased fruits be removed and destroyed at once, and those remaining should be sprayed to preserve them from attack. Condy's fluid (dilute) should be tried, as less likely to injure the fruits than copper solutions. Anyway, no effort should be spared at once to stamp out the pest. M. C. C.

THE VARIETIES OF CEANOOTHUS.

AMONG the numerous varieties of *Ceanothus* obtained by crossing *C. americanus* and *C. azureus* there are several that resemble the former of these two species in foliage, in their young glabrous shoots, the shortness of their inflorescence, and the white and rosy rather than distinctly blue colour of their flowers. The influence of the second species is sometimes seen in the pubescence, which the former lacks, and in the two very prominent lateral veins running almost parallel with the outline of the leaf-blade. But this last characteristic is not constant, and in the several species, hybrids, and varieties of the genus *Ceanothus*, all forms may be seen intermediate between those with branching veins and others with pseudo-parallel veins.

An easy means of distinguishing between varieties that are allied to one or other of these two types is desirable when making a selection for outdoor planting of those that are more or less hardy. It may be said that the forms fall into three distinct categories:—

1. The North American species, which are very hardy, even north of the United States (example, *C. americanus*).

2. Mexican species, which are half-hardy, generally bearing Parisian winters well and not suffering in severely cold weather (*C. azureus*).

3. Californian species, which are not hardy near Paris, although they are so in Brittany, the adjacent Normandy and the South (*C. divaricatus*, *C. papillosus*, *C. rigidus*).

It is useless to plant in gardens in central France species belonging to the third group. This is unfortunate, as the vegetation of *C. divaricatus* (to mention but one) is very rapid and fine; it is almost a tree, covered with blue flowers and charming tender green foliage, and is often seen thriving at Angers, where it only suffers in the most severe winters. The blue of the other Californian species (*C. rigidus*, *C. papillosus*, *C. cuneatus*, &c.) is still more intense and beautiful. All are tender.

But this is not so with hybrids of the first and second groups, which have provided splendid shrubs for our gardens, that in summer and autumn constantly re-bloom by means of axillary inflorescences that follow the terminal panicle. These charming thyrseoid racemes grow among pretty foliage, and show blue, violet, mauve, pink, and white shades in great variety. Here are the names of some of the best varieties:—

Blue.—Gloire de Versailles, Léon Simon, Bijou, Gloire de Plantières, Esther, Triomphe d'Angers, Sceptre d'Azur.

Pink, Lilac, or Violet.—Président Réveil, Gladiateur, Théodore Frébel, Marie Simon, Le Géant (rose carmine).

White or Whitish.—Fendleri (a thorny species), albidus, corymbosus, americanus plenus.

The novelty, *C. Ciel de Provence* (figured in the *Revue Horticole*) at present belongs to the second group. It is derived from *C. americanus* and *C. azureus*, but resembles the latter more than the former. It is a splendid hybrid obtained by MM. Fabre, père et fils, nurserymen, of Bagnols-sur-Céze (Gard). In their nurseries this plant surpasses all the other varieties in a large collection with which comparison is easy. For two years I have also grown it at Lacroix, and it has shown first-rate qualities, and has not ceased to flower all through the fine weather. *Ed. André, in Revue Horticole, July 16, 1903, p. 332.*

PLANT PORTRAITS.

GENETYLLIS (DARWINIA) TULIPIFERA and G. FUCHSIODES. *Revue de l'Horticulture Belge, July.*
ROSE ROSOMANES GRAVEREAUX. *Journal des Roses, May, H.T.*, white flushed with pink (Souper \times Notting).
ACER PLATANOIDES WITTMACKII. *Garten Flora, July.* A form with three to five lobed leaves; lobes lanceolate, central one much the largest; all green, with a golden-yellow margin.

TREES AND SHRUBS.

PRUNUS MAXIMOWICZII.

FROM Mr. Smith, of the Daisy Hill Nursery, Newry, the source whence so many rare and interesting plants have been distributed, we have received specimens in fruit of *Prunus Maximowiczii*. The tree is 25 feet in height, with branches in horizontal tiers, beset in spring with white flowers on the upper surface.

The leaves are about 1½ inch long, on slender petioles not half the length of the blade. In shape the blades are obovate, tapering to the wedge-shaped base, somewhat coarsely toothed or crenate, dark-green above, paler beneath, with prominent pinnate venation, glabrous, except along the nerves on the under surface. The flowering shoots are short, with smaller leaves, and bear near the apex one or two slender, hairy peduncles. Sepals and petals deciduous. Drupes the size of small Peas, crimson. Stone with a prominent ridged suture.

We do not find the tree mentioned in the *Kew Hand-List*, nor in Köhne's *Deutsche Dendrologie*, from which we infer that the tree is not in general cultivation. It is mentioned as a native of Yezo (Japan) in Franchet & Savatier's *Enumeratio Plantarum . . . in Japonia, &c.*, i. (1875), p. 117.

CORIARIA JAPONICA.

From the Royal Gardens, Kew, we have received specimens of this shrub, which with its profuse scarlet berries is now very attractive. The berries are borne on slender stalks raceme-fashion, the racemes clustered along the sides of the four-sided branches in erect or ascending whorls. The leaves are nearly sessile, ovate, acute, three-nerved. The plant is figured in the *Botanical Magazine*, t. 7509.

AGAVE FILIFERA VAR. FILAMENTOSA.

MR. SHAND, of the Greaves Nurseries, Lancaster, sends us a photograph (see fig. 44) of this interesting species, which after a long delay has lately flowered in his nurseries. Mr. Shand's specimen has suffered some check to growth, by reason of which the spike is not quite so symmetrical as the one represented in our figure published on January 1, 1870. Ordinary greenhouse treatment is all that is required for this plant, but when it shows signs of blooming it must be removed to the open air, or the lights must be removed to give it space wherein to develop.

HOW PLANTS SCATTER THEIR SEEDS.

(Continued from p. 87.)

How do aquatic plants distribute their seeds? In the seed of the white Water Lily, that glorious Nymph of our ponds and rivers, a large bladder is formed between the two outermost coats of the seed, and this bladder enables the otherwise heavy seed to float on the water, and thus be carried away by wind or current from the parent plant. Eventually the coatings of the seed decay and it sinks into the mud at the bottom, where germination can take place. But they may be distributed in another way. Birds which peck open the fruits for the seeds, carry away some of the latter, which are viscid, on the feathers surrounding their bills. In the yellow Water Lily, the application of the bladder device is somewhat different, as in this plant the fruit splits into several sacs containing the seeds, which sacs then become in part filled with air, enabling them to float away: on their decay the heavy seeds sink to the bottom. In the Bogbean, the Flowering Rush, the great Water

Plantain, the Arrow-head, and in that pretty aquatic, so like a miniature Water-Lily both in leaf and flower, the Villarsia, all great ornaments of our ponds and streams, the fruits or seeds also contain aerated tissue, and some are, moreover, shining and oily, and, thus, by the aid of one or other of these two means, are capable of floating, although otherwise heavy enough to sink.

(Potamogeton), which so often form a carpet over the surface of lakes and ponds, are enclosed in tiny swollen drupelets which float easily on the water by means of the aerated tissue they contain. Our large Bladder-Sedges have swollen utricles enclosing their fruits, which, when these drop off into the water, cause them to float.

We have so far studied three interesting methods by which plants distribute their seeds, viz., through the agency of wind, of water, and by various automatic mechanisms.

AGENCY OF ANIMALS.

One other means remains to be noticed, and that not the least wonderful and interesting of all, viz., the agency of animals. Strange as it may seem to the uninitiated, many of our plants common in hedgerow, wood, and field rely entirely upon beasts and birds for the sowing of their seeds. We have seen the ingenious adaptations plants possess for utilising the visits of another class of animals, the insects, in the process of fertilisation of their flowers.

How do plants avail themselves of the higher animals in the task of distributing and sowing their seeds? In very different ways. In some of our common woodland and hedge plants the fruits, or parts immediately surrounding them are furnished with thick-set, stiff, hooked hairs. Any animal, as we may all observe, on brushing against them, without fail carries away on its fur, wool, or hair, numbers of these seed-vessels, which cling very tenaciously by means of their innumerable hooks. Some of the well-known plants possessing these structures are the Enchanter's Nightshade (*Circea*) and Wood Sanicle (*Sanicula*) of our shady woods; the common Burdock of our road-sides, whose great fast-clinging burrs are too familiar; the Goose-grass or Cleavers (*Galium*), climbing by aid of the hooked hairs on its stems and leaves over every hedge; the Bur-Marigold (*Bidens*) of manure-heaps and ponds, the Hound's-Tongue (*Cynoglossum*), the wild Carrot (*Daucus*), the Bur-Parsley, the Hedge-Parsley, the common yellow Avens (*Geum*), and the yellow Agrimony (*Agri-monia*) of our hedge-sides. This method of seed-distribution appears to be one of the most efficient of all; for consider the long distances the fruits may thus be carried and distributed, and into what a variety of localities, before they are finally scratched, pulled, or washed off the animal's hide; and there is, moreover, no uncertainty in their being carried away when once an animal brushes up against the plant, for the fruits are bound to be detached and to cleave to the creature. This contrivance of hooked hairs will account for the great abundance of most of the plants possessing them; and, indeed, 10 per cent. of all flowering plants in the world are dispersed by this means.

Seeds of bog or water-plants lying in the mud at or near the water's edge are carried and dispersed in great numbers by birds either wading in the water or standing at the edge to drink, the seed-containing mud at such times clinging to their feet. Birds may by such means transport the seeds to great distances. The seeds of many common road-side or field weeds depend also largely upon this method for their distribution.

The Meadow Saffron (*Colchicum*), which beautifies the pastures of some of our counties in the autumn with its pink, Crocus-like flowers, has viscid seeds, which stick to the feet of the cows grazing amongst them, and thus get carried from pasture to pasture very efficiently.

The awns and bristles, also, of many of our common meadow Grasses are instrumental in attaching the grains to the hides of the animals which feed where they grow.

There is another method by which animals are enrolled in the service of seed-dispersal; and this

FIG. 44.—AGAVE FILIFERA VAR. FILAMENTOSA.

The seeds of the bright little Frog-bit (*Hydrocharis*), with its small white flowers and orbicular leaves, has mucilaginous cells in its outer coat, which, when the seeds come into contact with water, swell up greatly, and emit spiral threads which may possibly be the agents which prevent the seed's sinking immediately to the bottom. The seeds of our common Pond-weed

is, perhaps, the most interesting of all, not only on account of the way in which it is carried out, but because the plants adopting it add greatly to the autumnal beauty of every lane and wood and garden. I refer to the production of berries, sweet-tasting and exquisitely coloured. How many people really know the meaning and use of the wild berries they see in every hedge-side? I believe the majority imagine that they are there simply to make a pretty picture for our eyes, or to afford us food. But the book of the economy of Nature may be read otherwise. The brightly-coloured berries, whether red or black, or blue or yellow, or white, with their juicy palatable tissues, are formed in the autumn by the plants in order to attract animals of some kind, usually birds, which, by devouring them, carry off the seeds they deftly enclose, and eventually void the latter in some spot far from the parent plant. How wonderful is this co-operation between bird and plant, and the mutual benefit accruing therefrom to each being, so widely separated in the scale of life—as wonderful and interesting, indeed, as that existing between plant and insect for the work of fertilisation!

But how does the plant form its berries? There are many different kinds. The simplest is that such as we see produced by the Holly and the Deadly Nightshade (*Atropa*), for instance, where the ovary or incipient seed-vessel simply becomes fleshy in texture and sweet in taste, owing to the accumulation of a great quantity of sap in its cells containing a large amount of sugar and colouring matter in solution. Other instances of this type are afforded by the Gooseberry, the Currant, the Gueldres Rose (*Viburnum*), the Spindle (*Euonymus*), the Privet (*Ligustrum*). The fruit of the Blackberry and the Raspberry consists of great numbers of miniature drupes or stone-fruits united into a single whole, each one enclosing within its inner woody portion a single seed. The Cherry and Plum constitute a single such drupe on a large scale. In the Strawberry it is the upper swollen portion of the fruit-stalk, prolonged above the insertion of the petals and stamens, which assumes the fleshy, juicy character, embedded in which, all over its surface, are the tiny yellow seed-vessels or achenes, each enclosing a single seed. In the Rose, the Apple, the Pear, &c., it is the swollen portion of the fruit-stalk immediately below the calyx which constitutes the edible fruit, as hip or pome, and carries within its hollow receptacle the very numerous small seed-vessels or achenes, in the case of the Rose, and, in the case of the Apple tribe, the "core" or cartilaginous tissue of the ovary containing its numerous "pips" or seeds.

The dark Yew-tree furnishes for the birds very beautifully coloured red berries, contrasting well with its foliage. In this case, however, they are of quite a distinct type, for the seed is not enclosed in any seed-vessel or capsule, but is merely partially covered by an extra outer seed-coat, which develops only as the seed ripens, and at that period becomes soft and fleshy, and is known as the "aril." The uncovered seed is perceived inside. Where Yew-trees abound the seeds disgorged by the birds are very commonly met with on the rocks or walls around.

Such are the various types of "berry," which familiar and striking organ is simply the expression of the plant's successful efforts to perpetuate and distribute its species by means of the seeds which that "berry" contains; and these seeds, it may be noted, are adequately protected from the digestive juices of the bird's body by their tough outer coat, their germinating power being thus unaffected.

Among foreign plants there are often still more wonderful contrivances for the effectual dispersal of seeds; but in our own native flora we have seen that there is a sufficiently wide field of study for those who are interested in this, for the

organisms concerned, very important and far-reaching phenomenon.

The whole vegetable kingdom, in fact, is engaged in one vast competitive struggle, as if to determine what group, or genus, or species of plant shall most adequately fulfil that ancient command once given to man—"Be fruitful and multiply, and replenish the earth."

HOME CORRESPONDENCE.

GARDEN INSECTICIDES.—Please permit me to ask a question of the more observant of your fruit-growing readers. Have any of them noticed any injury to the crops of small fruits after using some of the newer insecticides the previous season? I mean in cases where no apparent injury to the foliage was seen at the time of using. I ask this in true faith, and in no sense with a view to injure the sale and use of what I still believe to be a very useful adjunct to any garden. In the early part of June, 1902, our Currant-trees (both black and red) were infested with green-fly. We decided to give them a dressing of quassia-mixture, according to instructions printed on kegs as sold. This had the effect of checking the fly, and beyond the fact that the fruit had a bitter taste when ripe, there was no injury seen to the trees at the time. This year, for the first time for thirty years, we have an almost entire failure of Currants, red and white ones in particular. I do not think the ungenial season is the entire cause, as there was very little show of blossom from the first. Tonight I was once again discussing this failure with our kitchen-garden man, who is an excellent workman, and has been here twenty-five years. He said it had come into his head that using that "stuff" last year might have had something to do with it. Hence this note. *Enquirer, July 25.* [We do not think quassia decoction would have any such effect, though it is conceivable some of the mineral poisons might check growth. Ed.]

ROYAL HORTICULTURAL SOCIETIES.—How is it we hear so little of the doings of the Royal Botanic Society, Regent's Park, whilst sundry correspondents are constantly singing the praises of the doings of the Royal Horticultural Society, and just as often denouncing the Society's sins of omission and of commission? Whatever the Royal Botanic Society are doing, they seem to be doing in a quiet, philosophical sort of way, reminding one, if you will allow the comparison, of half-a-dozen bullocks grazing in a meadow; after having fed, they lie down, rest, and quietly chew their cud until this natural act is completed, then they get up and feed as industriously as before. The Royal Horticultural Society reminds one of a noisy field of grasshoppers, which would fain make believe by their din that theirs is the machinery or motive power by which the whole horticultural business of the world is driven. I am quite in sympathy with all this, but I want to know how it is we hear so little of the doings of the Royal Botanic Society. Might it not be also to their advantage to make a little more noise? Were I living in London I dare say I should, like most other horticulturists living there, feel interested as to whether the long-wished-for site of the new gardens of the Royal Horticultural Society should be placed north or south of the Thames; but surely we in the Midlands, and also those even more northerly situated, need not be knocked down with a brick if we express a desire to have a site for the new gardens found in some convenient place north of the Thames. The Royal Agricultural Society have wisely placed their permanent showyard north of the Thames. Might there not be some wisdom in the Royal Horticultural Society acting in a similar manner? As regards the new Hall, someone a little while ago took pains to calculate the superficial area, and, I believe, also pronounced it adequate for all purposes, and now we have it echoed that, after sinking £40,000 in bricks and mortar, the place will still be inadequate for the certainty of the Society's progressive development. This seems a pity, because at the time of its inception and exhibition of its plans there were enough voices of caution raised. When the fiat was sent out to proceed with the building, my own opinion was, and

I dare say it was that of a good many more, that there were one or two at the back of it with the secret all their own, who could see their way to the successful completion of the new Hall. If this was not the case, then I conclude there were some persons in the Council over-precipitate in coming to their conclusions, involving the Society in enormous cost in building a place of questionable utility to the Society after all. True, if it does not suit, the place may be sold, but then comes in the trite old saying, namely, that fools build and wise men occupy! *W. Miller, Berkswell.*

PACKING AND SELLING FRUITS AND VEGETABLES: COTTON-WOOL AND WOOD-WOOL.—Permit me to thank you most heartily for the appreciative reference to the above little work in last week's *Gardeners' Chronicle*. With what you say respecting cotton-wool I entirely agree, and on p. 53 this remark occurs:—"There are objections, however, to both moss and cotton-wool when soft ripe fruits are being packed, as the materials named are not sufficiently elastic." Further on it is said:—"A substance that has come into use in recent years, and which has been greatly improved, namely, wood-wool, is free from most of the defects characterising ordinary packing, and is superseding all other materials wherever it can be employed." Pardon my calling attention to this, but the value of wood-wool has been amply proved for many purposes. *R. Lewis Castle.*

STRAWBERRIES.—My experience of the Laxton Strawberry, is like that of Mr. Bunyard, that it is not up to expectations; however it may do better another season on two-year-old plants. Royal Sovereign, President, and Vicomtesse H. du Thury had unusually heavy crops; British Queen, a fair crop of good flavour; Countess, a heavy crop of good flavour; Trafalgar, a good crop, but the fruits rather deficient in flavour; Dr. Hogg never does well here, and was a poor crop. *J. Barclay, Epsom.*

ROSE ZEPHERIN DROUHIN.—I am very pleased to hear that the above lovely Rose is much better known than I thought it to be; but I fear some of the writers have not got the true thornless Rose, as, for instance, your correspondent M. L. Williams says its colour is bright crimson-red. This is not correct; the flowers are a beautiful soft rose-pink, quite distinct from any other Rose I know of; and I may state that this Rose is a very old one, and was well known by the monks of Italy and elsewhere nearly a century ago, and not, as "E. B." states, in 1868. I got my plants from Mr. Anthony Waterer, of the Knap Hill Nurseries; also I had a kind letter from Mr. Peter Veitch, who says he noticed this Rose in flower in France last year. The only Rose catalogue that mentions this plant is G. Bunyard & Co.'s, Maidstone; it is there spelt "Zephorin Drouin," "colour beautiful clear cherry-rose"; but it is not there called the "thornless Rose." I would also write that Messrs. Turner, of Slough, mentioned this Rose to me last year when I paid them a visit. I am quite sure any real lovers of interesting old-fashioned Roses will not regret this thornless Rose being brought to their notice, and, as our Editor says, we shall be glad to know the correct way of spelling the name. *W. C. Leach.*

THE ORTHOGRAPHY OF SPECIFIC NAMES IN BOTANY.—It ought not to be a matter of indifference how the specific names of plants are written, but most amateurs seem to think it is so. I refer especially to the use of initial capitals. The general rule that initial capitals ought to be used with specific names when they are nouns substantive, or when they are obsolete generic names, is not always easy to apply without referring to some good botanical catalogue. But there is one detail about which botanists are not agreed amongst themselves. It has reference to proper names, and to adjectives derived from proper names. *Index Kewensis* and earlier authorities do not use an initial capital when the specific name is a geographical adjective, but use it when it is a personal adjective. The *Kew Hand-Lists*, published under the authority of the Director of Kew, treat both classes of adjectives alike, not using capitals in either case. This is certainly more logical and consistent, and as it is

approved at the national headquarters of botanical science, we may assume it to be correct. Here are examples:—We always wrote "*Crocus Tauri*" and "*Onosma tauricum*," &c.; but the old usage was "*Erigeron Roylei*," "*Inula Royleana*," &c.; new Kew usage, "*royleana*," &c. I ask, "Quid sequare, aut quem?" Will any objector to the change tell us why Kew is wrong? *C. Wolley Dod, Edge Hall, Malpas.*

MELONS AT LONGLEAT, WILTS.—For many years Longleat Gardens have been famous for Melons, which by successive gardeners have been grown on what is known as "the extension principle." The soil of Longleat seems to suit Melons in an extraordinary degree, for the highest state of perfection can be obtained with it alone. Fruits may be seen in almost every stage of growth, and this with no more effort than the usual fructification of the blossoms. Mr. Gandy confines himself to a very small selection of varieties. The one ripening at the time of a recent visit was Gunton Scarlet, a fruit of a useful size, well netted, and its flavour really excellent. The fact of the plants having made constant healthy growth would in a large measure account for the high quality in the fruit. An unrestricted root-run is afforded by enclosing the bed with a wall of loose brick, which, when necessary, may be taken down and the bed extended outward, the extra space being filled with fresh soil. This naturally induces new growth, assists the swelling fruits, and maintains the successive fruiting already referred to. It is no unusual thing to find plants with numbers of fruits varying from a dozen downward, and I have counted as many as eighteen fruits on a single plant in every stage of development. This is a feat by no means usual; indeed, it is beyond the capacity of the average gardener to adopt this desirable phase of Melon culture. The Longleat Melon-pits and houses are roomy and well heated, and in every way suited to the cultivation of Melons. But while this may be true, the slightest laxity of attention would reduce this ideal state to one strictly commonplace. In their growth and training the leader is taken up the roof unstopped until it reaches the limit allowed; lateral growths are taken along the wires horizontally until the roof-space is filled. Few plants are required—indeed, one plant may be made to fill the compartment in which it is planted. *W. S.*

HORTICULTURAL SCIENCE.—Some twenty or twenty-five years ago the late Mr. E. S. Dodwell, of Oxford, said to me, talking of horticultural journalism, "You may take as many or as few horticultural papers as you like, but the *Gardeners' Chronicle* must be one of them, as it stands pre-eminent in the attention it gives to horticultural science." I am glad to see from the leading article on July 25 that you have taken such a strong line on this matter, thus worthily keeping up the traditions of the *Gardeners' Chronicle*. I firmly believe that this question of horticultural science is vital to the future success of our craft, and I hope some movement on the lines you advocate will soon be made. *Florist.*

TRIALS OF VEGETABLES AND FLOWERS AT CHISWICK GARDENS.—The garden of the Royal Horticultural Society may not be a paragon of perfection, as regards soil, climatic, and atmospheric conditions, for the trial of the numerous samples of new varieties of vegetable and flowers sent there for trial. Of one thing, however, the senders may be perfectly certain, and that is that in planting and in the growth of the plants, each subject has a fair field and no favour. The lots on trial are planted on a piece of land that has been cultivated all over alike, and the after-cultivation in the case of each subject is exactly the same up to the time the crops are reported on by the Committee. Exceptions are sometimes taken to the awards given, and the decisions of the various Committees are occasionally adversely criticised. This is only natural, and quite right; and no one can find fault with fair and legitimate criticism, although I sometimes think that if the senders of samples for trial, and those who sometimes grumble at the decisions of the Committees, could see those bodies at work in the garden, adjudicating on the merits of the subjects that come under their notice, their opinion of the

value of the work done would be much enhanced. The Committees are large (I am speaking more particularly of the Fruit Committee), often consisting of from twelve to fifteen experts, brought together from many parts, some of them long distances, in order to place their services at the disposal of the Society and the gardening public. To show how their awards are safeguarded as regards their value, no awards can be granted unless there is a quorum of nine members present. It is difficult to conceive how any body of men can enter more fully or more minutely into the work to be done, or take more pains in coming to a just decision. Every point for and against every sample is thoroughly discussed, and an award is never given without having in its favour a substantial majority. Whether, however, the classification in planting might not be improved upon is an open question. For instance, in the case of Peas, early, mid-season, and late varieties are planted on the same date (about the middle of March), the rows mixed up in the quarters without discrimination as to the height of the haulm, earliness of podding, &c., some measuring not many inches, as others several feet; and all varieties are staked with sticks of the same height, and sown the same distance apart. A better way would surely be to plant the dwarf varieties, those of medium height, and the tall, each section apart. The varieties being new ones, some difficulty might be experienced in finding out their average heights; but this could be ascertained from those persons who send the seeds, who should be requested to furnish particulars as to height of haulm and earliness. Were this done in the future, comparisons would be easier, and judging generally facilitated. The value of a Pea does not centre wholly in its productiveness, quality, or earliness, but in its power of resisting drought, continuity of cropping, freedom from mildew, and its late-cropping qualities, which are likewise important factors. Sown all together at the same time, as is now the case, it is difficult to assess their proper value for use at various seasons. Classified as I have suggested, each in its section, whether early, mid-season, or late, a more correct judgment could be arrived at than by sowing all at the same time. Thus the early section could be sown in the month of February, the mid-season in March, and the late ones in May or June. *O. Thomas, Waldeck Road, Ealing.*

ROSA DEVONIENSIS.—More than fifty years have passed since first I saw thy face, and then, after lengthened journey by stage-wagon of some hundreds of miles from Exeter to Leeming Lane, yet thy flowers and lovely buds are still fresh in my memory! And to this day, after all the fine introductions, I know of no Tea Rose that can compare with *Devoniensis* when well done and in vigorous health. Your correspondent "R. D.," I assume rightly or wrongly, is our old friend Mr. Richard Dean; and his opinion of this Rose as a plant of long life I can fully bear out. Some five years since I saw a plant at Holly Hale growing in a Vine-border which had been planted when the house was built, I should say about the time this Rose was brought out; the flowers were so large I did not at first recognise it. I have at present in one of my cool-houses a plant on its own roots, struck from a single eye or bud (Teas were, in my early years, mostly done in this way from half-ripe wood), planted thirty years ago. The plants in the early part of the year throw up strong shoots clustered with flowers, erect, and of the finest quality, substance and shape. They set me thinking that when old varieties of Roses are shown once again with good taste, with their own buds attached, which I hope to live to see, this Rose will again come to the front, instead of those too formal lines of huge Cabbage-shaped flowers, which have been disbudded so that one Rose to the stem remains, and the bloom is afterwards "tweezered" and the outer petals turned back over, showing the flower, giving it an unnatural character, and often prizes are awarded to such monstrosities. With still the same love for the Rose as when I visited the first National Rose Society's show held in the St. James' Hall, I have come to the conclusion that North and South could not meet on equal terms, because of the difference in time of the principal blooming. *William Boston.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 4.—The meeting held on Tuesday last was one of the least interesting, and one at which the attendance of visitors was the lowest of the year so far. The entire exhibit was contained easily on three long tables.

Floral Committee.

Present: H. B. May, Esq. (in the Chair), C. T. Drucry, J. Jennings, C. J. Salter, G. Reuthe, C. Dixon, J. A. Nix, C. E. Pearson, C. E. Shea, E. H. Jenkins, W. J. James, G. Nicholson, W. Howe, R. C. Notcutt, and G. Gordon.

Messrs. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, showed Ferns chiefly consisting of thirty-six species and varieties of *Nephrolepis* in large and small examples. Of the better known species we may name *Barteri*, *acuta*, *philippensis*, *elegans*, *recurvata*, *ensifolia*, *exaltata*, *furcans*, *edmontonensis*, and *Duffii*. Others comprised *N. cordifolia*, *alata*, *neglecta*, *Bansei*, *rufescens acuminata*, *r. fimbriata affinis*, *pluma*, *exaltata multicpes*, *e. plumosa*, *Mayi*, *Lenziana*, &c. The firm showed besides these Ferns a group of Campanulas, inclusive of *C. Barrelieri* (of pendent habit), *C. gloriosa* (of erect growth), *C. isophylla Mayi* (trained in an erect form, as likewise drooping in its natural manner), *C. l. alba* and the blue-flowered type. Plants of *Nerium Oleander*, *rosea splendens*, having semi-double, bright rose-coloured flowers. Apparently the plants were but two years old from cuttings. For the entire exhibit a Silver-gilt Flora Medal was awarded.

Messrs. R. & G. CUTBERT, Southgate, Middlesex, had arranged a floor-group consisting entirely of white-flowered plants and cut bloom, the latter consisting of *Phlox Fiancée*, and the former of *Hydrangea paniculata grandiflora* of various heights up to 6 feet, and growing in pots; *Lilium lancifolium album*, and *Crinum Moorei*, each of which carried from two to four open blooms, all of which plants were in pots (Silver-gilt Flora Medal).

Messrs. DOBBIE & Co., Nurserymen, Rothesay, N.B., had a beautiful exhibit of well-grown Pentstemons as cut bloom, and of which we may mention the following:—*Miss Willmott*, crimson; *Wm. Cuthbertson*, deep crimson, and throat of white—a finely-expanded flower; *A. Rose Thomson*, rosy-red; *Auguste Cain*, a crimson self; *Talma*, white and pink; *Mary Lindley*, rosy-purple with white throat; and *Le Prophète*, pink with white throat. The rest of the exhibit consisted of *Shirley Popples*, *Poppies white-feathered*, *Ranunculus-flowered*, of several forms, sizes, and tints, *Carnation-flowered*, *Peony-flowered*, &c. (Silver Banksian Medal).

Messrs. W. BULL & Sons, King's Road, Chelsea, S.W., showed a group of *Dracæna Victoria*, leaf green with broad bands of creamy-white at the margin; likewise some small plants of *Licuala Muelleri* (Silver Banksian Medal).

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, exhibited cut Roses in bunches, consisting of many varieties culled from various sections. We remarked blooms of *Mrs. J. Laing*, still in good condition; *R. serratifolia* (China), *Gruss an Teplitz* (H.P.) *Royal Scarlet*, a single-flowered variety of a crimson colour; *Duke of Edinburgh*, *Lady Battersea* (H.T.), *Billiard et Barré* (H.T.), *Cheshunt Scarlet* (H.P.), very fair blooms of *Frau Karl Druschki* (H.P.), *Sir Rowland Hill*, one of the darkest-coloured Roses (H.P.); *Roger Lambert* (H.P.), crimson, the petals edged with white towards the tips; *White Lady* (H.T.), *Dorothy Perkins* (N.), *Rosa anemoneflora*, &c. (Silver Banksian Medal.)

Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, showed cut shoots flowering, and otherwise of hardy shrubs and trees, of which mention may be made of *Spiræa Fortunei alba*, with flat corymbs of white flowers, *S. Bumalda*, *S. B. superba*, *S. Nobleana*, *S. Anthony Waterer*, corymbs of a deep crimson coloured flower; *S. semperflorans*, *S. Billardieri*, &c.; various *Hypericums*, *Berberis*, *Ulmus Dampleri aurea*, *Quercus pedunculata nigra*, dark purple leaf; *Prunus Pissardi*, and several more. The firm likewise showed Cactus, Pompon and single-flowered Dahlias in some variety. (Silver Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited largely *Mammillaria*, *Echinocacti*, *Opuntias*, *Cereus*, *Echinocereus*, *Euphorbias*, *Echeverias*, and other succulents in large and small examples (Silver-gilt Banksian Medal). Mr. ANKER showed a similar but smaller collection.

Messrs. J. VEITCH & SONS, Ltd., Royal Exotic Nursery, Chelsea, S.W., showed a number of *Lantana salicifolia*, a plant previously shown. The flowers are

of a lilac colour arranged in corymbs $1\frac{1}{2}$ inch in diameter, the habit of growth is more decidedly erect and slender than that of ordinary *Lantanas*, and are abundantly floriferous; it is said to be a good bedder. The firm showed a showy *Fuchsia* with an unusually big white corolla striped with crimson. *Senecio clivorum*, with big corymbs of orange-coloured flowers 3 inches in diameter, a coarse showy plant for a moist place in the wild garden.

Messrs. THOS. CRIPPS & SON, Nurseries, Tunbridge Wells, showed a number of plants in 4's of *Disa grandiflora*, with one flower-stalk bearing from two to three blooms each (Silver Banksian Medal).

W. C. BULL, Esq., Rathlin, Ellington Road, Ramsgate, showed *Gladiolus* in six varieties possessing fine long spikes and unusually large flowers.

Awards.

FIRST-CLASS CERTIFICATE.

Nephrolepis Piersoni.—A species having stiff, almost erect, growing fronds of a light-green tint, and pinnae turned on their axes to the horizontal position, and thus giving rise to an appearance of great density. Shown by Mr. H. B. MAY, Dyson's Lane Nursery, Lower Edmonton.

Gladiolus Ellington Belle.—A creamy-white flower, the tint most pronounced in the interior of the throat. W. C. BULL, Esq., Rathlin, Ellington Road, Ramsgate.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshay, H. M. Pollett, N. C. Cockson, F. Wellesley, H. T. Pitt, E. Hill, G. F. Moore, J. W. Odell, W. Boxall, W. H. Young, J. Colman, H. Ballantine, and J. W. Potter.

There were four small groups staged, and various exhibits entered to go before the Committee.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr., Mr. J. Davis), staged a group in which were good *Cypripedium* × *Wiertzianum*, C. × W. R. Lee, and other C. *Rothschildianum* crosses; also the famous *Laelio-Cattleya* × *Digbyano-purpurata* Edward VII., but scarcely so fine as when originally shown; a fine mass of *Cattleya superba* with two spikes; a good *Cypripedium callosum* *Sanderæ*, *Cattleya* × *Elvina* (*Trianae* × *Schilleriana*), and two unnamed hybrid *Cypripediuma*.

Messrs. SANDER & SONS, St. Albans, secured a Silver Banksian Medal for a group consisting principally of hybrids, and including nine varieties of *Laelio-Cattleya* × *Martineti*, the best of them being an improvement on the large rose-purple original form; also L.-C. × *Bletchleyensis*, the one having lilac and the other copper-tinted flowers with claret-coloured lip; a fine L.-C. × *Henry Greenwood*, L.-C. × *Berthe Fournier*, *Cattleya* × *Shakespeare* (*Rex* × *granulosa*), and some hybrid *Cypripediums*.

Messrs. T. CRIPPS & SON, Tunbridge Wells, showed a group of about thirty finely-bloomed plants of *Disa grandiflora* in comparatively small pots, but the flowers of very fine colour and size, to the number of three to four on a spike (Silver Banksian Medal).

Messrs. HUGH LOW & CO., Bush Hill Park, showed a small group, in which were noticed a good *Cattleya El-dorado Wallisii*, *Cypripedium* × *Rothschildo-superbiens*, C. × *Kimballianum*, C. *Rothschildianum*, *Cattleya Gaskelliana*, C. × *Mary Gratrix* (*Harrisouiana* × *granulosa*), *Cypripedium niveum*, &c.

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, showed the very handsome *Cattleya* × *Atalanta superba* (see Awards), two plants of the pretty *Laelio-Cattleya* × *Issy* (*L. tenebrosa* × *C. Leopoldii*), with brownish-red sepals and petals and fine purple lip; and *Sophro-Cattleya* × *Saxa* (*Sophrontis grandiflora* × *C. Trianae*), a nicely-shaped, rose-tinted flower with a crimson blotch on the lip.

H. T. PITT, Esq., Rosalyn, Stamford Hill (gr., Mr. Thurgood), sent *Laelio-Cattleya* × *Kathleen*, a large flower with uniformly coloured dark-rose flowers having claret coloured veining on the lip; L.-C. × *Wm. Pitt* (*L. pumila* × *C. Aclandiae*), a purplish flower with darker markings on the labellum; *Cattleya lotricata* *Rosslyn* variety, *Masdevallia* × *Gairiana*, and *Sophro-Cattleya* × *Chamberlainiana*.

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed *Cattleya* × *Mrs. Pitt* (*Harrisouiana* × *aurea*), with sepals and petals rosy-lilac, lip showing more of C. *Harrisouiana* and less of C. *aurea* than Mr. Pitt's original specimen, white tinged with rose and with a yellow disc.

W. P. BURKINSHAW, Esq., Hessle, Hull (gr., Mr. Barker), sent *Laelio-Cattleya* × *Ivernia* (*L. tenebrosa* ×

L.-C. *callistoglossa*), a noble form with sepals and petals purplish-rose, and intense purplish-crimson labellum; and *Cattleya Warscewiczii* "White Queen," which secured an Award.

Awards.

AWARD OF MERIT.

Cattleya Warscewiczii "White Queen," from W. P. BURKINSHAW, Esq., Hessle, Hull. Flowers large, sepals and petals white, lip as in a typical light form and with the usual large whitish-yellow blotches on each side of the disc, the front being mauve purple margined with lilac.

Cattleya × *Atalanta superba* (*Leopoldii* × *Warscewiczii*).—A very fine improvement on the original form, for which Messrs. VEITCH received a First-class Certificate in 1891. The large flowers were of light purplish-rose, with a veining of purple. Front of lip crimson-purple. The best of its class.

BOTANICAL CERTIFICATE.

Angraecum Rothschildianum.—From the Hon. WALTER ROTHSCHILD, M.P. A new species of a section entirely new to gardens, its section known only by dried specimens of A. *Galeandra*. Rehb. f., the only species with which it is comparable. Leaves broadly ovate, one half extended beyond the other, but rarely divided at the tip, about 6 inches long, 3 inches wide. Scape pendulous. Flowers white with a light-green band running down the middle of the sepals and petals, a rich emerald-green disc, and blackish-purple interior base to the lip, the final third of an inch of the spur of which is inflated, laterally compressed and recurved at right angles. The showy white-margined labellum is nearly an inch across, and the whole flower attractive. It is also delicately fragrant.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the chair); and Messrs. H. Balderson, J. Cheal, H. Esling, S. Mortimer, H. J. Wright, J. Jacques, G. Norman, J. Smith, and G. Wythes.

Mr. W. TAYLOR, Market Grower, Hampton, Middlesex, showed *Peach Libra*, raised from a fruit of Alexander, the male parent not known. The fruits are smaller than those of last year from the same tree (second year of fruiting). In good season the flavour is good. The fruit resembles *Noblesse*, except that it has a little more colour on the sunny side. (Award of Merit).

Dr. BONAVIA, Worthing, showed the Sultanieh Grape, a small-berried rose coloured, transparent Grape, the Sultana of the shops, with delicate bloom but not much flavour (Vote of Thanks).

HANDSWORTH AND DISTRICT HORTICULTURAL.

JULY 24, 25.—This was the nineteenth annual exhibition of a Society which continues the work of the Handsworth and Lozells Horticultural Society. When John Wilmore, Henry Pope, Samuel Brown, and Chas. Jas. Perry were leading exhibitors, Handsworth was a large village with many florists residing in it, but has since grown to be a municipal borough, and has in the most open position in the town a public park; wherein by the permission of the Borough Council, the show was held, six large tents being required to contain the exhibits. It is an exhibition which grows in importance every year, and bids fair to rival Wolverhampton. The entries were much more numerous than usual. The schedule of prizes included 151 classes, and they were grouped under several divisions.

PLANTS.

The first twenty-five classes of the schedule were "open," and in these were to be found the leading features of the exhibition. Groups arranged for effect and filling a space of 300 square feet, were very fine, and all followed the pattern now so generally observed of arranging the plants in a square, with a large central cone surmounted by an elegant Palm, with a smaller cone at each corner. On this occasion, Mr. J. Macdonald, gr. to G. H. KENDRICK, Esq., was placed 1st, with a rich and well-arranged lot of plants, defeating Mr. J. CYPHER, of Cheltenham, who was 2nd.

With twelve stove and greenhouse plants Mr. CYPHER was 1st, with some of the large specimen Palms and *Codiceums* he is in the habit of exhibiting. He had of flowering plants a magnificent *Stephanotis floribunda*, a *Bougainvillea* *Cypheri*, *Ixora salicifolia*, 1. *coccinea*, &c.; Mr. W. VICUISE, Leamington, was a good 2nd. Some good bush-grown *Fuchsias* were staged; there were good specimen *Zonal Pelargoniums*, *Coleus*, *Caladiums*, &c., all generally well grown, bloomed and coloured, good prizes being offered in each case.

In the Gentlemen's Gardeners' and Amateurs' division there were classes for groups; and some very tasteful arrangements were set up. There were also classes

for stove and greenhouse plants, Ferns, *Fuchsias*, &c.; but the short time at our disposal, owing to the late hour at which judging commenced and the onerous duty of making the awards, prevented full details being gathered. Evidently there is a great deal of enthusiasm over plant-growing in the district.

FRUIT.

This was made a leading feature, and there was a valuable money prize, in addition to a Silver Challenge Cup, offered for a collection of not fewer than ten kinds, Pineapples excluded. Here Mr. Goodacre, gr. to the Earl of HARRINGTON, Elvaston, came to the fore in strong force, staging a representative collection of forty two dishes, all very good, which included Black Hamburg, Canon Hall Muscat, and Madresfield Court Grapes, three varieties of Peaches, two of Nectarines, Beauty of Bath, Worcester Pearmain, Lady Sudeley, and one other Apple, Jules Guyot, and Clapp's Favourite Pears, Washington, Jefferson's, Kirk's, and Czar Plums, &c.; Mr. J. Jones, gr. to J. NISS, Esq., was 2nd with twelve dishes of good fruit.

With six bunches of Grapes, three black and three white, Mr. GOODACRE was again 1st; he had two of Muscat Hamburg (finely finished), two of Canon Hall Muscat, and two of Black Hamburg; Mr. W. A. Coates, gr. to Col. PLATT, was 2nd; he had three of Black Hamburg, two of Foster's Seedling, and one of White Muscat.

Fruit was also shown by gardeners in Division III., and hardy fruits by cottagers.

FLORAL DECORATIONS.

Chief among these was a table of 8 feet by 4 feet, and there was a large number of entries. The 1st prize was taken by the RANELAGH NURSERY CO., Leamington, who had a handsome arrangement with *Orchids*, *Francoa*, and elegant foliage. Mr. C. Thomas, gr. to C. A. PALMER, Esq., was 2nd; this was very prettily arranged with pink Sweet Peas in combination with *russet Selaginella*, &c.

Cut Roses were a leading feature, handsome money prizes being offered. With twenty-four varieties Messrs. TOWNSEND & SONS, Worcester, were 1st; and the KING'S ACRE NURSERY CO., Hereford, 2nd, good blooms being staged. The class for twelve bunches of garden Roses was a fine feature. Mr. GEO. PRINCE, nurseryman, Oxford, came in 1st with fine bunches of *Grüsa* an *Teplitz*, *Laurette* *Messimy*, *Bardon Job*, *Crimson Rambler*, *Souvenir d'un Ami*, *Mrs. E. Mawley* &c.; Messrs. TOWNSEND & CO., were 2nd. Stands of twelve Teas were very finely shown by Mr. GEO. PRINCE and Messrs. TOWNSEND & SON, the prizes going in the order of their names.

CARNATIONS.

were also shown. The best twelve yellow ground or self came from Mr. R. C. CARTWRIGHT, King's Norton, who had some very fine flowers; Mr. A. R. BROWN, Handsworth, was 2nd; and these two exhibitors occupied the same positions with twelve white ground or self Carnations. In the Gardeners' and Amateurs' classes good blooms were shown by Messrs. J. MITCHELL and C. J. WHITE.

SWEET PEAS.

were a great feature, and they were numerously shown. The special prizes offered by Mr. R. Sydenham brought some very fine blooms from several sources.

VEGETABLES.

These productions were shown in good form in competition for special prizes offered by Messrs. Sutton & Sons, E. Webb & Sons, H. Simpson & Sons, Yates & Sons, and others. They were also largely shown by cottagers.

MISCELLANEOUS EXHIBITS.

were somewhat numerous, and they introduced very interesting features. Messrs. HEWITT & CO., Solihull, had a very imposing bank of cut flowers; Mr. W. B. CHILD, Acocks Green, had the same; and Messrs. DICKSONS, Ltd., of Chesler. The KING'S ACRE NURSERY CO. had Roses; Mr. F. G. THOMPSON, a collection of *Cacti*; Messrs. YATES & Co., hardy flowers; Messrs. SIMPSON & SON, cut flowers; Mr. W. WATERS, a collection of *Violas*; Messrs. AUSTIN & CO. had cut flowers; Mr. T. B. GROVES the same; Messrs. WEBB & SONS had Sweet Peas and other flowers; Mr. J. BOSTON, J.P., *Begonias*; the RANELAGH NURSERY CO., a large group of their handsome new *Asparagus myricladus*; Mr. W. WASTELL, soft-wooded plants, &c.

BOSTON HORTICULTURAL.

JULY 29, 30.—This old-established flower-show took place on the above date in the People's Park, South End, Boston, and with it was associated a horse-show and other accessories. It is a very popular county gathering, and being held on the market-day the agricultural fraternity is attracted to it in large numbers. Unfortunately the weather was very stormy early in the day. As a display of horticultural produce it was one of the best ever seen in Boston. One large tent was filled to overflowing; the neighbouring nurserymen and seedsmen also furnished miscellaneous exhibits.

Cut Roses occupied the first place in the schedule of prizes, and as the classes were open to all, Messrs. G. & W. BURCH, of Peterborough, were enabled to exhibit, and were awarded the 1st prize for twenty-four cut blooms, having a number of brilliant hybrid perpetuals among them; Mr. F. M. BRADLEY, Peterborough, was 2nd. With twelve varieties of Tea and Noisettes, three blooms of each, and also with twelve cut Roses, Messrs. BURCH were 1st.

Herbaceous and Bulbous Subjects are finely cultivated about Boston, and these were shown in imposing-looking bunches. In the Open class Messrs. ARTINDALE & SON, Nurserymen, Sheffield, came in 1st with a very good assortment from their nurseries a few miles out of Sheffield; Messrs. W. & J. BROWN, Nurserymen, Stamford, were 2nd; and the same exhibitors were 1st and 2nd with twelve bunches.

Messrs. ARTINDALE & SON were also 1st with twelve bunches of cut, stove, and greenhouse subjects, staging Ixora, Lapageria, Anthurium, Tuberosa, and suchlike in good form. Messrs. W. & J. BROWN were again 2nd. Zonal Pelargoniums in bunches were a good feature; and there was but one collection of Sweet Peas in the class for twenty-four bunches.

A class for twelve varieties of Carnations and Picotees brought some fine fancies and yellow-grounds from Messrs. ARTINDALE & SON, which were valuable object-lessons; they had particularly good Charles Martel, Alcinous, Mrs. E. Hambro', Pandelli Ralli, Stanley Wrightson, Perseus, Alberta (a charming yellow-ground Picotee), and Euryalus. Mr. F. M. BRADLEY came in a good 2nd.

Herbaceous Phloxes (some of the varieties very good), Pentstemons, and Lilies were excellent features. There were classes for Dahlias; some fair blooms of the Cactus type were staged.

Floral decorations formed an attractive feature. There were two classes for tables 8 feet by 4 feet—one for married ladies only as competitors, the other for spinsters—and in both cases very pretty arrangements were staged. A valuable Silver Cup was offered for a Championship Bridal Bouquet, and it was won by Messrs. PERKINS & SON, of Coventry, who had a very handsome arrangement of white Orchids and Roses, Pancreatium, &c. The Coventry firm were also 1st with an elaborate hand-bouquet in another class; Messrs. ARTINDALE & SON being 2nd. The best ladies' sprays in threes and the same number of button-holes came from Messrs. W. & J. BROWN.

A special Silver Medal, offered for the best and most attractive exhibit by the trade, was won by Messrs. ARTINDALE & SON. They had a background of bright foliage plants, wreaths, crosses, and other floral decorations, cut flowers, and about 150 blooms of Carnations, chiefly yellow-grounds, in excellent character. In this class Messrs. W. & J. BROWN and F. M. BRADLEY had very good collections also.

Plants were represented by groups arranged for effect, Messrs. ARTINDALE & SON taking the 1st prize with a bright arrangement; Mr. W. A. HERVEY was 2nd. Mr. W. A. HERVEY had the best six stove and greenhouse plants, and also the best six Ferns; good specimen stove and greenhouse subjects were staged. Coleus, Fuchsias, Begonias, Gloxinias, and table plants were also shown.

The leading class for fruit was for six dishes. Here Mr. BARSON, gr. to Earl SANDWICH, Hinchingsbrooke, was 1st, with Black Hamburg and Gros Maroc Grapes, Peaches, Nectarines, Figs, and Melon; Mr. J. DRAKES was 2nd with very good fruit. Mr. BARSON had the best two bunches of Black Hamburg Grapes. There were good Peaches and Nectarines.

In the Amateur division excellent produce was staged. Tropaeolum speciosum was finely shown in a collection of hardy flowers; Roses, Sweet Peas, &c., were also well represented. The vegetables shown by amateurs and cottagers were numerous and very good; the special prizes offered by Messrs. W. W. JOHNSON & SON, Ltd., and Mr. Geo. Wood Ingram, were keenly contended for.

In addition to the trade collections mentioned, Messrs. DOLBY BROS., Hope Nurseries, Boston, had plants, flowers, and fruit; Mr. A. W. EDWARDS, florist, Spalding, had floral decorations; Messrs. W. H. KILLINGWORTH & SON, West End, had plants; Messrs. H. H. SMALL & CO., Skirbeck, Boston, plants, Carnations; and Messrs. W. W. JOHNSON & SONS, Ltd., made a huge display with many bunches of fine Sweet Peas, hardy flowers, among which were many popular annuals and choice pedigree vegetables; also some new Sweet Peas, to three of which, viz., Eastern Queen (delicate primrose wings) and Standard, the latter pencilled with rosy-purple, and Elfrida, a charming striped variety, creamy-white, heavily pencilled with pale rose and rosy-purple awards were made.

NEWPORT AND COUNTY HORTICULTURAL.

JULY 29, 30.—A good show was held by this Society in King's High Fields, Newport, Monmouthshire, on the above dates, and although the season, in some respects has been unfavourable, the exhibits were generally (except that Mr. SUTHER'S groups and specimen plants were missed) equal to those of any preceding year.

Vegetables were excellent, and those staged by cottagers rivalled in quality those found in the other classes. Cut flowers were shown in considerable quantity, and of good quality; the table decorations were executed with much good taste; and fruit was up to the average. A tent was set apart for honey, and the classes were well filled. The show was opened on the first day by the President, the Right Hon. Lord TREDEGAR.

GROUPS OF PLANTS.

Collectively these consisted of well-grown plants, but those in the leading class were not the equals to what is usually observed at Newport. The smaller groups made up for this defect, and especially was this noticeable in the Begonia classes, which were excellent.

Group of Miscellaneous Plants, 121 square feet.—1st, Mr. Carpenter, gr. to W. J. BUCKLEY, Esq., Llanelly. This group consisted of Cattleys, Cannas, Campanulas, Celosias, Begonias, &c., set off by Palms, Codiaeums, Aralias, Ferns, &c., edged with Maidenhair Fern. There were two such groups shown.

Group of Miscellaneous Plants, 50 square feet.—Three exhibitors arranged groups with much good taste, the leading one being particularly good in this respect; this came from Mr. Lewis, gr. to Dr. GARROD THOMAS, of Newport. Col. WALLACE (gr. Mr. Powell) was a good 2nd. For a group of 25 square feet, Mr. Wiggins, gr. to Mrs. WALLACE, Newport, was placed 1st amongst six exhibitors, all showing well.

Begonias arranged in 25 square feet.—There were three entries in this class that made a pretty feature, the plants being models of good culture, and finely flowered, and the varieties in the leading exhibit, which came from Messrs. HEATH & SON, of Cheltenham, were especially fine. The 2nd place was well won by Mr. Mitchell, gr. to W. J. ORDERS, Esq.; 3rd, Mr. Jones, gr. to R. WILLIAMS, Esq.

Six Ornamental Foliage Plants.—These were well shown, though the Codiaeums were lacking in colour. 1st, Mr. Duff, gr. to Mrs. WILLIAMS, Brynglas, Newport, who staged Latania borbonica, Phoenix rupicola, Kentia Forsteriana, Cycas revoluta, and Codiaeum Williamsii; Mr. CARPENTER was a good 2nd.

Six Stove and Greenhouse Plants.—Mr. CARPENTER had no opposition in this class and staged fairly good subjects, of which Bougainvillea glabra, Stephanotis floribunda, Allamanda grandiflora, and Clerodendron Balfourianum were conspicuous.

Six Exotic Ferns.—Here Mr. DUFF was again the leading exhibitor, and staged large clean plants of old varieties, including a grand plant of Davallia Mooreana, and good specimens of Woodwardia radicans and Adiantum cuneatum. Mr. POWELL was a good 2nd, with similar well-known species.

Six Achimenes in distinct varieties brought six good lots, which, being arranged in a row as a margin to larger plants, made a showy display. Mr. Powell, gr. to Col. WALLACE, Newport, was a good 1st with very large panfuls, including the varieties grandiflora, Rose Queen, Scarlet Perfection, and Admiration. Mr. Wiggins, gr. to Mrs. WALLACE, was placed 2nd, with equally good but smaller panfuls.

Four Caladiums.—With these, which brought four good sets, Mr. POWELL was again placed 1st with well-grown, large, bright plants. Mr. Wood, gr. to H. OAKLEY, Esq., Newport; and Mr. Watt, gr. to E. PHILLIPS, Esq., following in the order named.

Zonal Pelargoniums.—Mr. Giddens, gr. to S. DEAN, Esq., Newport, was a good 1st for four zonal Pelargoniums, showing large beautifully-flowered specimens. Mr. WATT took the 2nd position amongst four exhibitors.

Six Dinner-table Plants.—These made a pretty feature, though many of the plants were lacking in colour. Mr. POWELL here was again 1st, and was closely followed by Mr. DAWSON and Mr. GIDDENS.

Miscellaneous.—Coleus, Gloxinias, and Petunias, six varieties in each class, were well shown.

CUT FLOWERS.

Twenty-four Hybrid Perpetual Roses.—There were two good stands of these staged, the 1st prize falling to Messrs. TOWNSEND & SON, of Worcester; Mr. STEPHEN TRESENER, Cardiff, was a very close 2nd.

Teas, Twelve Blooms.—The above exhibitors were again placed 1st and 2nd respectively in the same order.

Herbaceous flowers were beautifully represented in a space 12 feet by 3 feet. The well-known exhibitors of these subjects, Messrs. STOKES & SON, of Trowbridge, who were 1st, had a beautiful assortment of choice things, and amongst them was observed a very fine variety of Chrysanthemum, named Grandee; it is perfectly white, and has broad, slightly reflexed petals. These exhibitors also had their new Campanula, Hillside Blue, which attracted much notice at Cardiff last week. Messrs. HEATH & SON also staged an effective choice collection, and were awarded 2nd prize.

Twelve Vases of Sweet Peas, &c.—Mr. BASHAM, Fair Oak Nursery, Bassaleg, was the only exhibitor in this class, and staged a fine assortment of leading varieties, arranged with their own foliage. He was deservedly

awarded the 1st prize. Messrs. TUPLIN & SONS, Newton Abbott, was 1st for twelve Carnations in the Open class, and as usual staged a beautiful set of large blooms.

FRUIT.

Collections of Six Dishes, open.—There were only two collections in this class, the best coming from Brynglas (Mr. DUFF), who staged good dishes of Muscat of Alexandria and Black Hamburg Grapes, Early York Peaches, Governor Wood Cherries, Sutton's Scarlet Melon, &c.; Mr. Watts, gr. to C. D. PHILLIPS, Esq., was a close 2nd. Mr. Curtis, gr. to F. S. CARTWRIGHT, Esq., was 1st for Black Grapes, staging Madresfield Court. Mr. HIGGINS 1st for white varieties, with perfectly coloured Buckland Sweetwater. Mr. WATTS and Mr. Long, gr. to H. DAWSON, Esq., were respectively 1st and 2nd for Peaches, each staging Royal George. Mr. LONG came to the front for Nectarines, and staged a fine dish of Pitmaston Orange. Mr. WATTS was 1st for Gooseberries, with a fine dish of Whinham's Industry, and 1st for Cherries, with a good dish of Governor Wood. Mr. MITCHELL was 1st for two Melons, with nice fruits of Hero of Lockinge and The Countess.

Vegetables.—Messrs. DUFF, RICHARDS, and GIDDENS, were the leading exhibitors of collections of vegetables, for which Messrs. Sutton & Sons, Messrs. Garaway & Co., and Messrs. Wheeler & Son, offered money prizes.

Non-competitive Exhibits were largely and well shown. Mr. BASHAM, Fair Oak Nursery, staged about fifty dishes of hardy fruits, and fruit-trees of Peaches, Apples, and Gooseberries in pots, which carried good crops of fruit.

Messrs. GARAWAY & Co., Bristol, had a large group of stove and greenhouse plants in pots, consisting of many choice subjects. Messrs. TUPLIN & SONS, Newton Abbott, arranged a select collection of Dahlias (Cactus), Carnations, and Gladioli; Messrs. WHEELER & SON, Gloucester, a representative group of hardy herbaceous perennial flowers; Mr. E. JONES, Newport, Begonias and Ferns; Mr. G. H. THOMAS, Newport, floral crosses, wreaths, &c.; and Messrs. DENNIS, floral wreaths and hardy fruits.

"ST. IVES HORTICULTURAL.

JULY 30.—This was the twenty-eighth exhibition of this Society, which is an extremely popular one in the district, though on this occasion the weather proved very stormy, to the great disappointment of many from country districts. The show was held in some private grounds near the main street of the town.

In the Open division the best group of plants came from Mr. BARSON, The Gardens, Hinchingsbrook; Mr. E. A. EBSWORTH was 2nd, and Mr. JOHNSON, 3rd. The space allotted for each was too small to permit of much effect. Mr. EBSWORTH came 1st with six stove and greenhouse (a nice specimen of Bougainvillea Sanderiana was in his half-dozen), Mr. BARSON taking the 2nd prize. Some fairly good plants of Coleus were staged, the best six from Mr. W. WARNER. Tuberous-rooted Begonias were a very good feature indeed, Mr. G. D. DAY taking the 1st prize with well-grown plants of excellent quality; Mr. WARNER was a very good 2nd. Mr. WARNER had the best foliage plant, and Mr. BARSON the best plant in bloom. The latter was 1st with six very pretty table plants; Mr. T. LOCKIE, The Gardens, Diddington Hall, St. Neots, was a close 2nd. Very good Gloxinias were shown by Mr. LOCKIE and by Mr. H. GOODMAN, the prizes being awarded in the order of their names. Balsams and Streptocarpus were also shown.

Cut flowers included Roses. The best twelve came from Mr. C. LAMPLOUGH, Mr. R. M. COPLEY, 2nd, both showing good blooms for the season. Tea Roses were of poorer quality. Gladioli were shown in spikes of six. Mr. LOCKIE had the best six bunches of stove and greenhouse cut flowers; and Mr. H. GILLIAT was 2nd. Mr. G. D. DAY was 1st with twelve bunches of hardy flowers, and Mr. H. GOODMAN 2nd, both showing in good form.

Sweet Peas made a pretty feature. Mr. C. LAMPLOUGH had the best twelve bunches, and Mr. EBSWORTH the best six bunches. Zonal Pelargoniums, both double and single, in trusses, were good; and some pretty varieties of the Ivy leaf type were staged. Carnations were also shown in bunches.

Some eighty-one classes, including a few for wild flowers shown by children, also for home-made bread and honey, composed the Cottagers' division. There were plants for windows (the best hanging basket contained a well-grown example of Asparagus Sprengeri; Campanula isophylla alba, well grown and bloomed, was much in evidence); also for cut flowers and vegetables, the latter very good indeed; while 102 Classes were set apart for amateurs, who showed in good form throughout, and especially in the case of their vegetables.

Special prizes were offered for six dishes of vegetables by Messrs. Sutton & Sons, Mr. LOCKIE taking the 1st prize with a well-balanced collection; Mr. BARSON taking the 2nd prize with a collection only just inferior. Mr. BARSON took the first of the special prizes offered by Messrs. Webb & Sons for a collection of six dishes; Mr. C. H. COOTE being 2nd. Mrs. JOHNSON was the only exhibitor for Messrs. Daniels Bros.

special prizes. In the case of those offered by Messrs. Wood & Ingram (J. E. Perkins, Huntingdon, for a collection of eight varieties, Mr. LOCKIE was 1st with good produce; and Mr. G. D. DAY, 2nd.

Miscellaneous collections of plants, cut flowers, &c., were shown by Messrs. WOOD & INGRAM; Roses, Carnations, &c., Messrs. G. & W. BURCH, Peterborough; Roses, Messrs. W. & J. BROWN, Stamford, and Messrs. WOOD & INGRAM, Huntingdon.

BRISTOL & DISTRICT GARDENERS MUTUAL IMPROVEMENT.

JULY 30—By the invitation of the Rev. G. F. Whidborne, this Society held its monthly meeting at the Priory, Westbury-on-Trym, on the above date. About sixty members were entertained at tea by Mr. Whidborne, after which the company was afforded the opportunity of viewing the picturesque grounds and greenhouses. The greenhouses were much admired, especially a corridor wall 100 feet long and 30 feet high, covered with Zonal Pelargoniums, which is certainly a sight not seen every day. These were planted thirty years ago, and have thriven wonderfully, and at the present date they form a mass of flowers.

The visitors having gazed on the chief features of the garden, adjourned to a room in the garden, and proceeded with their meeting, when Mr. J. T. Curtis (gr., to Mr. W. HOWELL DAVIS) read an excellent paper on *Eucharis grandiflora*, he being the successful competitor for a prize offered by Messrs. Parker & Sons for the best essay on the subject. Mr. Whidborne then presented five Royal Horticultural Society Medals for five members for regular attendance.

ABBAY PARK FLOWER-SHOW, LEICESTER.

AUGUST 4, 5—This is one of the few purely municipal flower-shows held in the kingdom, as it was founded and supported by the Corporation of Leicester for the benefit of the townspeople; and any balance remaining over after all expenses are paid is devoted to providing music in the public parks. A very fine exhibition indeed was provided on this occasion; it was said to be the best held since the present series was established eighteen years ago. The weather on the opening day which had a rainy appearance in the morning, became brilliantly fine, and there was an enormous attendance. The Abbey Park was seen at its best, the bedding-out arrangements were excellent, the ornamental and sub-tropical portion very fine, doing great credit to Mr. John Burn, the superintendent.

PLANTS

may be said to play a minor part at the Abbey Park shows. There was a class for a group of 180 feet, for which Mr. JAMES CYPHER, Cheltenham, took the 1st prize with one of those elaborate arrangements he is in the habit of setting up, rich in flowering and foliage plants alike. Mr. THOMPSON, Littleover, Derby, came 2nd with a charming group; and Mr. W. FINCH, Coventry, was 3rd. With six stove and greenhouse plants Mr. FINCH came 1st, having three in flower and three foliage; Mr. H. BLAKEWAY, gr. to Sir A. MUNTZ, Bt., Rugby, was 2nd. Mr. Blakeway had the best six Ferns, staging well-grown specimens in excellent character; and Mr. H. ROGERS was 2nd. The best specimen plant in bloom was *Bougainvillea Sanderiana* from Mr. FINCH.

CUT FLOWERS.

Roses are always a leading feature at Leicester, and they were pre-eminently so on this occasion. It was quite a field day for Messrs. A. DICKSON & SON, Newtownards, Belfast, for they won all the leading prizes. With thirty-six distinct varieties the Newtownards firm were an easy 1st. This stand contained a large, full, fine-petalled and brilliant H. Tea named George Dickson, a superb back-row flower with something of the bright hue of Liberty. This was selected as the best Rose in the show, and it created quite a sensation among the rosarians present. Messrs. D. & W. CROLL, nurserymen, Dundee, came 2nd with some very good blooms; and Messrs. HARKNESS & Co., Hitchin, were 3rd. Messrs. DICKSON & SON were 1st with remarkably good twenty-four blooms; 2nd, Mr. J. BARROW, florist, Leicester; and 3rd, Messrs. HARKNESS & Co. With twelve Teas, Messrs. DICKSON & SON carried off another 1st prize; Messrs. D. & W. CROLL were 2nd; and Messrs. HARKNESS & Co., 3rd.

The best twelve blooms of one variety were from Messrs. DICKSON & SONS, and Messrs. JARMAN & Co., Nurserymen, Chard.

The best twelve Teas of one variety were Mrs. E. Mawley, from Mr. SRS. DICKSON & SONS; Messrs. CROLL were 2nd with the same variety, and Messrs. HARKNESS & Co. 3rd with White Maman Cochet.

Roses were also shown by gardeners and amateurs, and in several classes very good blooms for the season were staged.

Begonia blooms in the class for twenty-four doubles, as well as for that number of singles, were finely shown by Messrs. BLACKMORE & LANGDON, Twerton Nursery,

Bath; Messrs. JARMAN & Co. were 2nd with doubles; and Mr. C. BURDETT, Great Bowdon, with singles.

There was an excellent display of Carnations of all types, and some very good blooms were shown by amateurs also. The best twelve white-ground Carnations came from Messrs. THOMSON & Co., Nurserymen, Birmingham; they were also 1st with twelve blooms of white-ground Picotees.

Mr. G. RUDD, Cotteridge, was 1st with twelve excellent blooms of yellow-grounds, and also with twelve blooms of self; Messrs. THOMSON & Co. being 2nd in both classes. Single blooms were also shown in three classes.

Hardy Annuals in collections of twelve bunches made an interesting feature. Mr. M. FIRTH had the best.

Mr. BLAKEWAY came in 1st with twelve bunches of stove and greenhouse cut-flowers, showing in excellent form. Single Zonal Pelargoniums, Fancy Pansies, Viola, Show and Cactus Dahlias were in good form.

The collection of twelve bunches of hardy herbaceous and bulbous flowers from Mr. W. B. CHILD, Acoc's Green, which gained the 1st prize, was very fine indeed.

FRUIT.

was so good that Mr. Owen Thomas, who was one of the judges, spoke of it in the highest praise.

With eight dishes, in which three varieties of Grapes were permitted, Mr. J. H. GOODACRE, The Gardens, Elvaston Castle, Derby, was 1st, having very fine Black Hamburgh, Muscat of Alexandria, and Madresfield Court Grapes; Barrington Peaches, Elruge Nectarines, Figs, Melon, and Queen Pine. 2nd Mr. J. READ, The Gardena, Broth Park, Chesterfield, with Buckland Sweetwater and Black Hamburgh Grapes, Peaches, Nectarines, Plums, &c.

In another class for eight dishes, limited to two varieties of Grapes, Mr. GOODACRE again came in an excellent 1st with Black Hamburgh and Muscat of Alexandria Grapes, Raymacker Peaches, Elruge Nectarines, Dr. Jules Guyot Pears, Lady Sadcle Apples (both very fine), splendid Negro Largo Figs, &c. 2nd Mr. J. READ; and in this, as in the former class, none of his fruit was named, despite the requirement of the schedule to that effect.

The best collection of four varieties of Grapes, two bunches of each, Mr. GOODACRE came in 1st with very fine examples; he had Madresfield Court, Muscat of Alexandria, and Muscat Hamburgh, the latter finely finished; Mr. J. READ came 2nd, his best bunches were Muscat of Alexandria and Madresfield Court.

With two superb bunches of Black Hamburgh Grapes, Mr. GOODACRE again came 1st; Mr. J. SWANWICK, Nottingham, was 2nd. Mr. GOODACRE was also 1st with two very fine bunches of Muscat of Alexandria; Mr. W. DUNCAN, Bosworth Hall Gardens, Rugby, coming 2nd.

With two finely finished bunches of Muscat Hamburgh in the class for any other black, Mr. GOODACRE was 1st, Mr. DUNCAN coming 2nd with Madresfield Court.

Mr. H. BLAKEWAY came in 1st with a dish of Peaches, and he was also 1st with Nectarines; Mr. GOODACRE taking the 2nd prizes in both classes.

Melons were shown in two classes, and also Cherries, Mr. GOODACRE taking the 1st prizes in both. Gooseberries were numerous and fine. There were excellent Apples and Plums from Elvaston.

Currants were very good, white, red, and black. Mr. J. HUDSON had the best twelve Tomatoes; and Mr. GOODACRE was 2nd, both very fine.

VEGETABLES

were in fine character, and numerous shown by all classes of exhibitors. In the open class for twelve dishes, Mr. J. HUDSON exhibited finely; Mr. J. READ was a good 2nd. Potatoes shown in pairs of dishes, Cucumbers, Vegetable-Marrows, Peas, Broad Beans (both Windsors and Longpods), Onions (spring-sown and autumn-sown), short and long Carrots, Turnips, and Cauliflowers, were all good.

The Collagers had a very fine display in the large tent, the task of judging was a very onerous one. In addition, special prizes were offered by Messrs. Sutton & Sons, Reading, for six kinds of vegetables; Messrs. Harrison & Sons, seed merchants, for ten dishes, and also for Sweet Peas; Mr. Robert Sydenham, Birmingham, for Sweet Peas; Mr. R. Pringle, seedsman, Leicester, also for ten varieties of vegetables; Messrs. Yarde & Co., seedsmen, Northampton, for Sweet Peas and Antirrhinums, &c. All these afforded interesting features.

MISCELLANEOUS EXHIBITS.

Miscellaneous exhibits introduced many features of popular interest, and could they have been gathered together would have formed an exhibition of themselves. Gold Medals were awarded to Mr. W. BENTLEY, florist, Leicester, for an extensive collection of very fine bunches of Roses staged with great taste; to Messrs. BLACKMORE & LANGDON, Twerton Nursery, Bath, for one of those superb collections of cut single and double Begonia they are in the habit of staging; to Mr. W. B. CHILD, Acoc's Green, Birmingham, for a grand bank of hardy flowers; to Messrs. W. & J. BROWN, nurserymen, Stamford, for a collection of plants which included *Verbena Miss Willmott* in excellent character; and to Mr. F. M. BRADLEY, nurseryman, Peterborough, for Sweet Peas, Carnations,

&c., including some charming floral decorations. Silver Medals were awarded to Mr. CARNALL, Lower Road, Leicester, for decorations, various plants, cut flowers, &c.; Mr. C. HOLDEN, florist, Hinckley, for Sweet Pea in excellent character; to Mr. CHAS. WARNER, The Abbey, Leicester, for Roses; to Mr. H. DEVERILL, Banbury, for Zonal Pelargoniums and hardy flowers; to Messrs. JARMAN & Co., nurserymen, Chard, for Roses, Sweet Peas, &c.; to Mr. W. L. PATTISON, Shrewsbury, for Violas; to Messrs. HARRISON & SON, seed merchants, Leicester, for plants, hardy flowers, including Sweet Pea, &c.; to Mr. J. BARROW, Leicester, for bunches of charming Roses, &c.; to THE RANELAOR NURSERY COMPANY, Leamington, for a group of *Asparagus myriocladus*, to which a Certificate of Merit was also awarded; and to Mrs. HODGKINS, Didsbury, Manchester, for illustrations of vegetable anatomy.

A Silver Medal was awarded to Mr. W. FINCH, Coventry, for a very fine specimen of *Ixora Williamsii*; and Certificates of Merit to Messrs. W. W. JOHNSON & SON, seed merchants, Boston, for Sweet Pea—*Gladya Deal* (delicate lavender-blue, of excellent form) and *Elfrida* (cream-ground striped with rosy-crimson).

TRADE NOTICE.

A PUPIL of the School of Horticulture at Ghent is anxious to work for two months (August and September) in some nursery near London. He would require board and lodging, but no salary. The Director gives him a high character for industry and competence. Address to the Director of the School of Horticulture, Ghent.

CULTURAL MEMORANDA.

THE PIMELEA.

THE PIMELEA is a hard-wooded, greenhouse plant, free-growing and compact habit, and produces nice flower-heads from the points of the shoots. There are about half-a-dozen varieties of the Pimelea in cultivation, the most meritorious of these being *P. spectabilis rosea*, which is a robust grower, yielding in May and June heads of flowers, white and flushed with purple-rose, nearly as large as those of the *Gueldres Rose*. *P. Hendersoni* is more erect in growth than the preceding variety, the individual shoots being crowned with smaller but very beautiful pink flowers in May and June; but the date of flowering may and is frequently retarded until August for exhibition purposes.

Cuttings taken off after the plants have gone out of flower, and inserted round the edge of efficiently crocked 3-inch pots filled to the rim with fine peat, this being pressed quite firm and surfaced with silver-sand, watered through a fine rose, and then placed under a hand-light or bell-glass in the greenhouse, will form roots in due time. The soil should be kept uniformly moist. Pot singly into small pots (72's), using fine peat as before, with a little silver-sand incorporated therewith as a rooting medium, making this moderately firm in potting. Return the plants to the hand-light, water, and shade from sunshine for a few days until the roots have taken to the soil, when it should be dispensed with altogether, and the plants afforded a position near the glass. As the pots become fairly filled with roots, shift into larger ones—say, 3 inches, 4½ inches, and 6 inches in diameter, these being the most useful sizes for decorative purposes. Pots from 10 to 12 inches in diameter will be large enough for specimen plants. Coarser, that is more lumpy, peat should be employed in each additional shift of the plants into larger pots, this being rammed quite firm between the balls and side of the pots, as well as on top, with flat and round blunt-ended rammers in potting, as all hard-wooded plants do better in firm soil. The young plants should be pinched to induce them to branch, and with the same object in view they should be cut back after they have gone out of flower. H. W. W.

THE WEATHER.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period July 26 to August 1, 1903. Height above sea-level 24 feet.

Remarks.—The weather has been dull and cool, with rain on six days. Total rainfall for July, 3.95 inches.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending Aug. 1, is furnished from the Meteorological Office:—

"The weather was again in a very unsettled condition, with frequent and, in many cases, heavy falls of rain. Thunderstorms occurred in several parts of Ireland on Sunday, and in the north of Ireland only on Monday, and over a considerable portion of England on Wednesday.

"The temperature was below the mean, the deficit being slight (only 1°) in Scotland, England, N.E., and the Channel Islands, but rather large (3°) in England, N.E. The highest readings which occurred at various times in the different districts, ranged from 74° in the Midland Counties, and 73° in Scotland, N. and England, N.E., to 68° in Ireland and Scotland, N., and to 67° in the Channel Islands. In the middle part of the week the daily maxima on our north-east coasts were often below 60°, and in some places below 55°. The lowest readings also occurred on varying dates, and ranged from 40° in England, N.W., and 41° in Scotland, N. and E., to 47° in England, N.E. and S.W., and to 53° in the Channel Islands.

"The rainfall was considerably in excess of the average over the United Kingdom generally, but was about equal to the normal in England, N.W., and Ireland, N., and slightly in defect in Scotland, N. In Scotland, E., and England, N.E.E., and S., the total amount was more than three times the weekly average, the largest aggregates reported at individual stations being 3.5 inches at Marchmont, 2.8 inches at Shields, and 2.2 inches at Hastings (St. Leonards).

"The bright sunshine was less than the normal, the deficiency being slight in most of the grazing districts, but large in the wheat-producing districts. The percentage of the possible duration ranged from 42 in the Channel Islands, and 35 in England, S.W., to 17 in Scotland, E., and 15 in Scotland, N."

THE WEATHER IN WEST HERTS.

Cold, Wet and Sunless.—The present cold, wet and cloudy period has now lasted over three weeks. During that time there has been only one seasonably warm day; most of the nights, on the other hand, were rather warm than otherwise. The ground is now at about an average temperature at 2 feet deep, but about 1° colder than is seasonable at 1 foot deep. Rain has fallen on all but four of the last nineteen days, and to the total depth of 3½ inches—which is equivalent to a watering on each square yard in my garden of 16½ gallons. In order to show how saturated the ground has become, I may state that in the last eight days nearly a gallon of rain-water has come through the percolation-gauge on which short grass is growing—a very unusual circumstance at this time of year. The sun has shone on an average during the week for about four hours a day, or for about two hours a day less than usual. The August Bank Holiday was the only bright day of the week. The winds have been, as a rule, rather high, and have come mostly from some

westerly point of the compass. The mean amount of moisture in the air in the middle of the day was about 8 per cent. in excess of the average for the season.

JULY.

This was a cold, wet, sunless month. With the exception of the same month last year this was the coldest July for twelve years. The days were, as a rule, more exceptionally cold than the nights. There occurred only five really warm days, and on three of these the temperature in the thermometer-screen rose to or above 80°. On the coldest night the exposed thermometer fell to within 3° of the freezing-point. It was the wettest July for eight years. Rain fell on sixteen days to the aggregate depth of 3½ inches, or about three-quarters of an inch in excess of the July average. The whole of the rainfall, except a few insignificant showers, was deposited during the latter half of the month. Of the total amount (equivalent to a watering of 15 gallons on each square yard), 9 gallons came through the bare soil percolation gauge, and half a gallon through that covered with short grass. In only two other Julys during the last eighteen years has there been as little sunshine; in fact, the record fell short of the average by more than an hour a day. The winds were as a rule light, and for 455 hours, or nineteen days, came from some point between south and west. The atmosphere was more humid than in any July for nine years.

MARKETS.

COVENT GARDEN, August 6.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

REMARKS.—Vegetable-Marrows are now coming fast, in bushel flats, at 2s. to 2s. 6d.; in pads, 4s., prices have a downward tendency. Tomatoes are also coming in, and they are of less value. English Apples, viz., Ecklinville, Keswick, and Julien, per sieve or half bushel, 3s. 6d.; Devonshire Quarrenden, 6s. to 7s.; Pear "Chalks," sieve, 3s. 6d. to 4s.; Californian, in cases, 12s. to 14s. Naples Melons, in cases, 10s.; Morello Cherries from 6d. to 1s. per lb. for good samples.

POTATOS.

Home-grown, 4s. to 5s. 6d. per cwt. John Bath, 33 & 34, Wellington Street, Covent Garden.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending August 1, 1903, and for the corresponding period of 1902, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1902.	1903.	Difference.
Wheat	31 8	28 11	- 2 9
Barley	25 0	21 0	- 4 0
Oats	22 10	16 6	- 4 4

FRUITS AND VEGETABLES.

GLASGOW, August 5.—The following are the averages of the prices during the past week:—Apples, Lisbon, 1 s. to 12s. per case; Tomatoes, 6d. to 8d. per lb.; Oranges, Naples, 9s. to 12s. per box; Melons, 6s. 6d. to 9s. per box; Lemons, 6s. 6d. to 10s. per box, and 10s. to 14s. per case; Grapes, English, 1s. 3d. to 2s. 9d. per lb.; do., Denia, green, 5s. to 7s. do.; do., black, 11s. to 13s. per barrel; Onions, 3s. 6d. to 5s. per case; Strawberries, 4d. to 10d. per lb.; Dutch Currants, red, in tubs for preserving, were 18s. per cwt.; red Gooseberries, 20s. do.; Scotch and Irish Barringtons, 23s. to 25s. per cwt.; Irish green Gooseberries, 18s. to 20s. per cwt.; Dutch Carrots, 6s. to 7s. per hamper; Cauliflowers, 2s. per hamper.

LIVERPOOL, August 5.—Wholesale Vegetable Market.—Potatoes, per cwt. Early Regents, 3s. 6d. to 4s.; Kidneys, 5s. to 5s. 6d.; British Queen, 4s. to 4s. 6d.; Turnips, 8d. to 1s. per 12 bunches; Swedes, 3s. to 3s. 6d. per cwt.; Carrots, 8d. to 1s. per 12 bunches; Onions, foreign, 4s. 6d. to 4s. 9d. per cwt.; Parsley, 4d. to 6d. per dozen bunches; Lettuce, English, 6d. to 10d. per dozen; Cucumbers, 1s. 8d. to 3s. do.; Cauliflowers, 1s. to 2s. 3d. do.; Cabbages, 6d. to 10d. do.; Celery, 2s. to 2s. 3d. do.; Peas, 3s. 6d. to 5s. per hamper; Beans 2s. to 2s. 6d. do. St. John's—Potatoes, 1s. 4d. per peck;

Peas, 1s. to 1s. 6d. do; Cucumbers, 3d. to 6d. each; Gooseberries, 3d. to 4d. per lb.; Currants, Red, 6d. do.; Peaches, 4d. to 6d. each; Grapes, English, 1s. 6d. to 3s. 6d. per lb.; do. foreign, 6d. to 8d. do.; Pines, foreign, 4s. 6d. to 6s. each; Mushrooms, 11d. per lb. *Birkenhead*:—Potatos, 1s. to 1s. 4d. per peck; Peas, 10d. to 1s. 4d. per peck; Cucumbers, 2d. to 4d. each; Currants, Red, 6d. to 8d. per lb.; Peaches 4d. to 6d. do.; Cherries, 6d. to 8d. do.; Gooseberries, 3d. to 4d. do.; Grapes, English, 1s. 6d. to 4s. do.; do. foreign, 6d. to 8d. do.; Tomatos, English, 6d. to 8d. do.; Mushrooms, French, 10d. to 1s. do.; Filberts, 8d. do.

ANSWERS TO CORRESPONDENTS.

**** EDITOR AND PUBLISHER.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the literary department, and all plants to be named, should be directed to the EDITOR. The two departments, publishing and editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPLES: G. N. L. S. The flowering of Apples on terminal shoots is very common this year, in consequence of the peculiar season.

CORYDALIS SEMENOVII: A. R. G. Why not advertise your wants in this journal?

FERN FROND WITHERED: *Constant Reader.* If this is the only damaged frond on the plants an injury to the stalk may have caused it to wither. If the injury is general throughout the house we should suspect foul air from a drain or other source. Sometimes such injury will arise in a freshly-painted house which has been kept close. If chemical manure has been used that might cause the mischief. Fumigation or the injudicious use of insecticides is another source of danger.

FRUIT-TREE ESPALIER FENCE: J. B. Make this of iron wire, not twisted but solid, $\frac{1}{8}$ inch in diameter, fixed in long lengths to malleable iron standards let into blocks of stone sunk 2½–3 feet into the ground, and furnished with one strut each to counteract the strain. If the wires be secured each to a swivel and screw-hook at one end and the other direct to the post, the wires can be readily tightened should they get slack in the course of time. The fence will last for half a century without repairs, whereas wooden fences are a constant source of expense in painting and repairs, whether with or without iron wires to which to train the branches. The wire and standards before rusting sets in should be primed with red-lead paint, and finished off with two coats of slate-coloured paint.

GRAPES: T. L. and E. P. D. The berries are affected with the too common "spot fungus," (*Gloeosporium*). Try spraying with weak Bordeaux-mixture. Sulphate of potash would be of no use, but sulphide of potassium might be; the latter is generally known as liver-of-sulphur; use ½ oz. to 1 gallon of water.

GRUBS WRAPPED IN LEAVES: J. Allsop. You have sent us a nest of one of the leaf-cutter bees, *Megachile centuncularis*. Each grub is enclosed in a single cell, formed usually of Rose-leaves. These bees often disfigure the Rose-leaves by removing circular and ovate pieces for the formation of their cells, but they do not seriously injure the plants.

MELON: L. W. The Melon-spot, so terribly prevalent. Burn the plants, and spray next season with weak Bordeaux-mixture, the formula for which has repeatedly been given.

LAUREL LEAVES: J. Allsop. We are unable to indicate the cause of the injury. It is not caused by insects.

LAWN: J. B. M. *Prunella vulgaris*. Spud it up, and apply some rich manure, which will favour the growth of the finer grasses.

LILIAM LONGIFLORUM HARRISII (SYN. *L. L. EXIMIUM*) STARTING TO GROW A SECOND TIME IN ONE YEAR: W. T., *Addlestone*. The bulb having flowered two months ago the first stem has decayed, and its place has been taken by a fresh one. The bulb may have been a retarded one, and forced into bloom by having heat applied in the spring. You must replot the bulb or surface the soil with fresh compost, and grow on out-of-doors till cold weather arrives, then remove to a greenhouse or pit, and keep moist till the bulb flowers and the stem decays. When that occurs turn the pot on its side on the moist floor of the greenhouse till the spring.

LORD CARINGTON'S SMALL HOLDINGS ACT: *Inquirer.* You would do well to obtain a copy of the Act from Eyre & Spottiswood, the King's Printers. It would cost but a few pence. Doubtless you would find it of use in dealing with tenants.

MELON DISEASED: H. K. T. Stem canker at the collar. Too much moisture.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—F. O. *Catasetum fimbriatum*.—A. B. *Artemisia vulgaris* (Wormwood).—J. K. R. 1, *Rondeletia speciosa*; 2, *Plumbago rosea*; 3, *Centranthus ruber*; 4, *Lychnis chalcedonica*; 5, *Cryptomeria japonica*; 6, *Lycyteria formosa*; 7, *Achillea Millefolium roseum*; 8, *Sequoia sempervirens*; 9, send in flower; 10, *Cistus ladaniferus*.—H. P. P. 1, *Prunus Pissardi*; 2, *Thuja gigantea*; 3, *Cupressus Lawsoniana aurea*; 4, *Abies Clanbrassiliana*; 5, *A. Pinsapo*; 6, *Rosa rugosa*; 7, *Abies*—perhaps *Nordmanniana*; 8, *Pinus Larico*. The peculiar season we are having, and the situation they are growing in, probably cause the damage to your Sweet Peas.—J. T. R. *Dendrobium Dalhousieanum*.—W. T., *Addlestone*. *Dactylis glomerata variegata*, useful for edgings to flower-beds, &c.—W. H. D. *Alyssum saxatile*.—W. J. G. *Asparagus myriocladus*.—*Max L.* The *Statiche* is probably *S. Gmelini*. The two *Codonopsis* cannot be specifically distinguished, for the large one see the figure, *Botanical Register*, vol. xviii., t. 3; one sees in the herbarium flowers of intermediate size, but most of the material is like the larger flower. The smaller flower is like that of Royle's *Illustr.* A.B.R.—P. W. C. *Nepeta violacea*.—C. J. P. 1, *Ulmus campestris variegata*; 2, *Retinospora ericoides* of gardens; 3, *R. dubia*; 4, *Juniperus virginiana* var. *Sshottii*; 5, *Thuja orientalis*; 6, Flowering state of Ivy *Hedera helix*.—*Miss Kaye.* *Trachelium cœruleum*.—G. C. 1, *Thalictrum majus*; 2, *Ononis arvensis*; 3, *Lolium italicum*; 4, *Hypericum perforatum*; 5, *Lupinus polyphyllus*; 6, *Spergularia arvensis*; by no means characteristic Perthshire plants.—W. H. D. *Alyssum saxatile*.

NODULES ON ROOT OF CULINARY PEAS: J. F. C. These are common to all Leguminous plants; they are due to the irritation set up by bacteria, which do good by rendering available the nitrogen of the air.

PEACH DECAYED: H. D. The fruit sent is affected with ordinary rot common on stone fruits, Apples, Pears, Strawberries, &c., *Monilia fructigena*. It is met with on half-ripe, over-ripe, and fallen fruits; and in the case of Apples and Pears, the fruits sometimes dry up and hang on the trees till late in the year. The conidia overspreads the skin, causing cracks, through which the spores enter. The poor flavour complained of in your Peaches may be due to excess of water at the root, lack of air and sunshine, or to the varieties not being good ones. All decaying fruits should be collected and burnt.

PEACHES DISEASED: T. O. A. Mildew; apply flowers-of-sulphur and burn all affected fruits.

PEAR LEAVES: *Mill Hill.* The slug-worm, a grub of a saw-fly. Burn the fallen leaves as far as you can. Spraying with infusion of quassia, if practicable, might be serviceable.

POTATO FOLIAGE: W. H. *Divers.* This is the Potato-disease, *Phytophthora infestans*. Spraying with Bordeaux-mixture is the only means of checking the spread. G. M.

PTERIS FRONDS DISCOLOURED: *Nurseryman.* The injury is caused by mites, so small that they have escaped your notice. Try vapourising with XL-All, or a weak mixture of tobacco-water and plain water.

SHRUBS: J. C. M. P. You may safely remove the evergreen shrubs in August and early the following month if you take good masses of earth with the roots. Keep the bushes syringed for a month afterwards.

THORN-LEAVES: G. V. Mildew. Pear-branches appear to have been scorched when wet.

TOMATOS: S. D. & Son and F. S. The plants in both houses are suffering from the same disease, caused by a well-known fungus pest called *Cladosporium fulvum*. Pick off and burn badly infected leaves, and spray all the plants thoroughly with potassium permanganate every other day, 1 ounce of the crystals to 10 gallons of water.

VIOLET: H. C. The yellow colour is due to the imperfect formation of chlorophyll from the cold, wet, sunless season acting on weak individuals.

ZEPHIRE OR ZEPHYRE: X. The word is spelt in both ways. It has been said that a difference in meaning attaches to the two words—that "Zephyre" is the west wind, and "Zephyre" any mild wind. But Littré recognises no such difference.

GARDENING APPOINTMENTS

MR. F. R. BROWN, formerly General Foreman in the Gardens, Glenart Castle, Co Wicklow, as Steward and Gardener to the Right Hon. the Vice-Chancellor of Ireland, New Park, Blackrock, Co. Dublin. He entered upon his duties on July 24.

MR. WILLIAM COOK, for five and a half years Foreman at Horstead Hall Gardens, Norwich, as Head Gardener to H. COMPTON, Esq., Minstead Manor House, Lyndhurst, Hampshire.

MR. H. E. FORSTER, until lately Foreman in Coworth Park Gardens, Sunningdale, Berks, as Head Gardener to Mrs. BARBER, Park House, Englefield Green, Surrey.

MR. F. W. PARKES, for the past few months employed in the gardens at Wykeham Abbey and previously Head Gardener at Royston Manor, Retford, as Head Gardener to Lord MIDDLETON, Wollaton Hall, Nottingham.

MR. WILLIAM MABROTT, until lately Head Gardener at Doddington Hall, Lincoln, as Head Gardener to the Lady MAUD ROLLESTON, Watnall Hall, Nottingham, and entered upon his duties on August 4.

MR. A. BARNES, late Gardener at Denne Hill, Canterbury, as Gardener to S. CRESSWELL, J.P., Hole Park, Rolvenden, Kent. He entered upon his duties June 15.

MR. JAMES T. FLETCHER, lately of The Gardens, Riverside, Harrowby, Grantham, as Head Gardener to Lady PULESTON, Emral Park, Wrexham.

SEASIDE GARDENING.

THE aim of this article is to indicate the means of making the shores of our marine resorts gay with flowers or attractive by well-arranged and contrasted foliage during the summer or early autumn, according to the period which is the "season" at any given resort.

Already in these columns, articles relating to seaside planting of trees and shrubs of a permanent character have appeared; but when this work is done there should always be room for additional plants of perennials, bedding plants, or annuals. The judicious choice of these will determine whether the work be done satisfactorily, or simply for immediate effect, without thought for the future or the fitness of the subjects used for the work.

It is needless to say that to succeed, plants used on the breezy shore must be dwarf, and to a certain extent rigid in character, or the first gale will ruin them; but if care has been exercised in arranging permanent low hedges of Tamarix, Lycium, or Euonymus japonica, or any well-tried marine shrub, many other things may be successfully used, though the planter must always be prepared for accidents and sudden storms, which now and again will wreck his work.

Artificial shelter is sometimes very needful, especially immediately after planting. The plants should in all cases have been well hardened off before being put in their places, or disappoint-

ment will be sure to follow. Appropriate shelter is provided by low woven hurdles and coarse Jute netting or scrim canvas, all of which are easily fixed and serve the purpose admirably.

Pelargoniums should be selected from the zonal section, characterised by small foliage, close compact habit, and from those bearing small trusses on rigid, stout foot-stalks. The plants should, if possible, be old and woody, or, at least, from cuttings struck early in the autumn of the previous year, as these are not likely to run to coarse and sappy growth, and as a consequence will flower more freely. If the soil is strong, let the plants be frequently pinched back.

Varieties are numerous and nearly every gardener has his favourite sorts, but the following will be found a good selection: Crimsons—Dr. Rawson and Edward III; Scarlet—West Brighton Gem and Vesuvius; Pink—Mrs. E. T. Crocker and Master Christine; White—Queen of Whites and Salmon Surprise. Pelargonium beds may be edged with any of the close compact Ivy-leaved kinds, as Galilee or Madame Crousse, and a good golden edging is furnished by Golden Harry Hieover, and of silver-foliaged kinds, Silver Crown and the old Bijou and Flower of Spring. The bicolor or bronze section furnishes us with two very fine kinds, Black Douglas and MacMahon, while in tricolors there is none better either for habit or colour than Henry Cox, as it grows well, is stiff in habit, and the foliage is brilliantly tinted. If foliage is desired, keep the bloom trusses constantly removed. The Ivy-leaved class will repay for frequent pegging-down, and all kinds will greatly benefit by the frequent removal of spent trusses of flower. The colours in the foliage of both the bicolor and tricolor-leaved Pelargoniums are much more vivid by the sea, and I have noticed too that the Cape everlasting, Apelexis and Phenocoma, are much brighter in hue, and the bracts of Bougainvillea glabra are quite a shade darker when grown under the influence of the sea breeze.

The late Miss Anne Pratt states in her *Plants of the Sea-shore* that an almost universal characteristic of such littoral plants is the grey-blue or glaucous colour of their foliage and stems, so marked in the wild Cabbage, Seakale, Horn Poppy, and very noticeable also in the sea Hollies (*Eryngium*). We may safely take this as a guide in a selection of fit subjects for our present purpose. One of the most effective and handsome beds is made by planting *Eryngium giganteum* in the centre, and *E. amethystinum* (*Oliverianum*) round it; or a variation of this is a single plant of *Scolymus hispanicus*, either surrounded by *Alyssum montanum* or *Santolina incana*, and for a bit of colour use *Alternanthera* or one of the larger *Amaranths*, as *A. melancholicus ruber*. The free-flowering Sea-Lavender (*Statice profusa*) also makes an excellent summer bed, but is not hardy like *S. latifolia*. A good finishing plant for such beds is furnished by *Thalictrum adiantifolium*, of which the flowers should be removed. Almost all the Pink and Carnation-tribe thrive by the sea, but choice should rest with the small tufty-growing kinds known popularly as Pinks. These are all furnished with fragrant flowers, and when past flowering are neat and effectual, while in colour of flower they offer us almost unlimited choice.

Mixed beds of these are, however, preferable; and plants of the new Margaret section, which may be grown as annuals if sown early in gentle heat, are especially adapted, giving as they do endless variety of colour and neat grass-like leaves, while they are free and continuous bloomers.

Stocks of all kinds being mostly of marine origin thrive at the sea-coast, but it is safer to plant out from nursery-beds in the spring such kinds as East Lothian, intermediate and the Brompton sections. The dwarf kinds should be used, as the upright-growing or giant kinds are

too tall, and so will be broken by the wind. The annual (Ten-weeks) Stocks are admirable for the purpose, and give us quite a kaleidoscopic range of colour, while they are also sweet-scented. Continuous flowering is secured by not allowing any seed-pods to form.

Of the many so-called bedding-plants, the dwarf-growing Lobelias (*Erinus* varieties) are all suitable and useful, as also are the dwarf, compact-growing Heliotropes, and the brilliant though malodorous Lantanas. A mixed bed of the purple foliaged cardinal Lobelia, called Victoria, dotted with tufts of silver grass (*Poa trivialis* variety), forms a cool rest for the eyes after the glare of a cloudless summer day; and even more so is an arrangement of the Cape Leadwort, *Plumbago capensis*, pegged down, and associated with a soft pink or purple Verbena. Of Verbenas, the kinds most desirable are the compact-growing sort known to florists as Imperatrice Elizabeth, with trusses of small striped flowers (its growth is close to the soil); and the truly perennial *V. venosa* also does well in the sea air. The last may be treated as an annual. Other Verbenas are the scarlet "Defiance" and Snowflake, which are very fragrant, and both come true from seed; and for a blue take auriculæflora or Purple King, which may be trusted also to come correct to colour from seed, though they may vary a little in habit of growth and height.

All the Marguerites do well at the seaside, but the old *Chrysanthemum frutescens*, with its neat, deeply-cut, glaucous foliage and abundance of starchy, pure-white flowers, is the best; and preference should be given to the yellow form called "Feu d'Or," as it does not grow so rankly as the older yellows, and blooms more freely, while it is not so apt to be disfigured by the leaf-mining maggot. The *Agathæa cœlestis*, or Blue Daisy, may be planted round beds of Marguerites, as its half-shrubby character serves to keep it in bounds. Where the beds are sheltered from winds, the fine kind known as *Halleri maxima* will serve admirably, but it is not so free-flowering as *frutescens*.

In like positions, some of the large-flowered dwarf Italian Cannas may be used. Of the scarlets, one called Queen Charlotte is one of the best; and good yellows are Admiral Courbet and Sicilia. Beds of these are conveniently bordered with such dwarf kinds as *Anguste Chantini*, or the distinct *Ehemanni*, the broad, Musa-like foliage of the latter being very effective.

Among handsome-leaved plants, we have in the Cape Honey-flower (*Melianthus*) a most useful and very handsome plant, with large, deeply-cut foliage of a silvery sheen. *M. major* is the one usually found in gardens, associated with subtropical plants.

The New Zealand Flaxes (*Phormium*) are among the most wind-resisting of foliage plants, and are of great service planted round the outside of beds of softer-leaved plants, as Cannas or Begonias. The green-leaved type is good, but there are some very fine variegated sorts—*tenax variegata* and *Colsoni variegata*, the last giving varied shades of yellow and green in its tough, leathery foliage. The *Phormiums* are easily raised from root-cuttings, or the typical kind from seed; but the seed takes a long time to germinate, and the young plants are very slow in coming to useful pieces for either garden or conservatory decoration.

The dwarf, small-flowered early *Chrysanthemums* make also a neat and pretty bed, and their habit being stiff and erect, and their flowers generally small, they resist stormy winds well. The highly-coloured crimson Marie Masse and crimson Source d'Or, with Grace Ottick and White Quintus as pure whites, Flora and Lizzie Adcock for yellows, Rose Wells and Sam Barlow for pink, will furnish all one needs in varied colour.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

LILIUM × CHALCEDO-HANSONI (CHALCEDONICUM ♀ × HANSONI ♂).

FROM C. B. Powell, Esq., The Old Hall, Southborough, Tunbridge Wells, comes an example of a good hybrid between *Lilium chalcedonicum* and *L. Hansonii*, the growth of the plant with its ascending leaves partaking much of the seed-bearer, but the flower deriving its chief characteristics from *L. Hansonii*. Perianth-segments 2½ inches long and more than 1 inch in width, reflexed; bright orange, tinged with Indian-red, lighter in tint towards the tips, and bearing minute warted chocolate spots and reddish papillæ at the base and lower half. Style and anther filaments an inch in length; anthers of an orange-scarlet colour.

About raising *Lilium*s from seeds, Mr. Powell gives the following information:—"We sowed in 1899 in a frame various Lily seeds, all supposed to be hybridised; but most of them have come true to the seed-bearing species, so far as we have proved them. It proved, however, how much faster some kinds mature than others, for *L. Henryi* bloomed in 1901, and one of its bulbs has borne four flowers this year. Over a dozen of the *L. martagon* album from the same batch are just gone over, some having had nine or ten blooms. We carefully crossed *L. Henryi* with *L. Wallichianum* in 1901, and these are only in the first-leaf stage after two years' growth." J. O'B.

FLORISTS' FLOWERS.

DAHLIAS AT CHISWICK.

AMONGST the trials of flowering plants conducted at Chiswick from year to year, none have created more interest than have those relating to Cactus Dahlias. But the plants have largely been allowed to grow naturally, thus showing merits or demerits as garden decorative objects just as nature has made them. That form of culture, however, has given offence to the Dahlia fanciers who form the National Dahlia Society, and who have complained that the Chiswick "go-as-you-please" culture was not that of Dahlia experts, however much it may be that of the general public. This year the trial of Cactus Dahlias is limited to varieties that have been put into commerce during the past five years. That fact gives to the trial additional interest in the eyes of Dahlia lovers, and one result should be the production of some that, whatever may be their merits for flower exhibition, have at least good merits as garden flowers. Too much of the energy of raisers has been devoted to mere exhibition effect, which is far from being the highest floral aim for any flower, and too little to garden decoration. That this use should be best found in plants that grow naturally, only needing support as do all Dahlias, seems to be that which ordinary cultivators of the Dahlia desire. However, a good deal of deference has been shown to the requirements of Dahlia-experts in connection with the trial this year. Each plant we observed recently has had its leader taken out, and three side shoots only retained. Each of these is fastened to a tall Bamboo-stake, and on the whole of the plants, of which there are very many, the shoots will be kept thinned, as growers treat their plants. It is to be hoped, however, that there will be very little disbudding practised. It is essential that Fellows, or all others interested in Dahlias, should be enabled to note weak as well as strong points in all the varieties. In garden floriferousness, raisers may well seek to produce a Cactus race that are as free bloomers as are the Pompons. A. D.

THE STRAWBERRY CROP OF 1903.

THIS has been one of the best years for Strawberries at Belvoir Castle Gardens, only very few of the flowers having been injured by the frosts that occurred in the month of April, the plants making good progress until the dry period, May 17 to June 13, during which time only 0.15 inch of rain fell. As this dry period continued for so long, the beds were afforded a copious application of manure-water before they were mulched with litter. Immediately after this an abundant rain came, which did the plants much good.

Burghley President was the first variety to ripen its fruits, a good dish being gathered on June 30. This variety has a cockscomb-shaped fruit of very high colour and rich flavour; the plant has an excellent constitution.

Royal Sovereign was ready a few days later, and afforded an excellent crop, as it usually does.

La Grosse Sucrée bears well here in the open border, and is valued for home use because of its mild flavour; it has no trace of the acidity which *Royal Sovereign* and *Sir C. Napier* have; but it is too soft for travelling satisfactorily.

Vicomtesse Héricart du Thury gave a heavy crop, as usual; it is our favourite for preserving, as it keeps whole, and is of excellent flavour.

President grows well here, and gives a good crop of firm fruit and of good flavour.

Gunton Park is not a heavy cropper, but it has very large, showy fruits, which are somewhat soft inside.

Britannia (Carmichael) has done well; it is similar in appearance to *Queen of Denmark*, but larger than that variety; both have a very rich flavour, similar to that of *Frogmore Late Pine*, which I imagine was one of the parents of these varieties.

British Queen gives a moderate crop, and is the best flavoured of all Strawberries.

Dr. Hogg grows here on a north border, where it gives a middling crop of fine, highly-flavoured fruits.

Laxton's Latest-of-All is a good cropper, and is very useful in fine weather. We gathered the last from a north border on July 31.

Frogmore Late Pine is one of the best for flavour, but does not ripen well on the under side.

Waterloo is the favourite here for late crops. We have to-day (August 1) gathered the last dish. We find this variety takes longer than others before it bears a good crop, and can be left a year longer than others with advantage.

Calling on Messrs. Laxton on July 24, I was too late to see their large and interesting collection in fruit, but noted a few nice fruits of "The Laxton" of rich colour and excellent flavour under ordinary field cultivation; these were only just the finish of the crop: the plants were growing healthily and looked well. A new variety, not yet named, similar in colour to *Waterloo* and of enormous size, was just ripening. This, when sent out, will probably prove a standard variety, as it combines good flavour with solidity, good colour right through, and is of extra-large size, late in its season, and of a good constitution; and what more should a Strawberry-grower want? A very interesting lot of autumn-fruiting seedlings had just commenced to ripen, and contained many very promising varieties, in which the colour and size of the summer varieties have been combined with the perpetual character of *St. Joseph*. Some of these will prove invaluable when they are distributed. W. H. Divers, *Belvoir Castle Gardens, Grantham*.

THE SULTANIEH GRAPE.

ON August 4, at the Drill Hall, I exhibited a basket of a very interesting Grape, Sultanieh Grape, that which, in its own country, produces our old friends the Sultana raisins.

It is a delicious Grape, of a lovely reddish-amber colour, with a fine bloom; crisp (croquant), with a flavour that combines a trace of acidity with sweetness; and best of all, it is quite seedless, a quality of no small value in a Grape.

I know of only two varieties of Grapes which are seedless—the Sultanieh and the black Monagga. I think that both these have a future.

We have recently heard a great deal about that pathological nuisance called "appendicitis." Well, these two varieties of Grapes may be styled "anti-appendicitis" fruit. The seed of the Grape is peculiar; it is pear-shaped and has a sort of beak, and is perhaps more likely to stick in the vermiform appendix of the large intestine, if swallowed; and it is not easy to avoid swallowing a seed or two sometimes. The Strawberry-seed is too small to stick; the Plum-seed too large; but the Grape-seed appears to be of the right size to do mischief.

Apart from all this, everybody will tell you that the seed of the Grape is one of its drawbacks; yet, strange to say, nobody appears to have taken up the cultivation of these two fineseedless Grapes, either for private consumption or for market purposes. The delicious Sultanieh Grape raises an interesting question in one's mind, which is this:—Would it be possible with the pollen of the Sultanieh to pollinate some of the Grape-flowers of the varieties under cultivation, such as the Muscats and others, and thereby evolve seedless varieties of these fine Grapes? This is a question that can be answered only by experiment. Here is then an opening for some wealthy amateur to make a name for himself by such an achievement, and at the same time benefit mankind.

The Sultanieh produces fine large bunches, every flower of which sets. In its own country the Sultanieh produces much smaller berries than those shown in my exhibits, judging from the size of the Sultana raisins. Those shown were never thinned at all; by proper thinning and cultivation by experts, the size might be considerably increased, and the bunch made a very respectable and beautiful thing.

Those shown were grown under glass, with heat in winter and only sunheat in summer. This year, however, there has been little sun. E. Bonavia, M.D.

[To Dr. Bonavia we are indebted for a small bunch of this Grape. The bunch was oblong compact, the individual berries oblong conic, rather less than 1 inch long (23 mill.) and less than ¾ inch in width (16 mill.), pale greenish-yellow or amber-coloured, flushed and speckled with pale purple. The flavour is pleasant, slightly sugary, like a Sweet-Water, and would be specially grateful to those to whom the more highly-flavoured Grapes would be distasteful. If someone would invent a Red Currant or a Raspberry in a similar seedless condition, he would be rendering a service. We spell the name as Dr. Bonavia did. In *Hogg's Fruit Manual*, and generally, it is called "Sultomah." Ed.]

SEED TRADE.

A FORECAST OF THE SEED CROPS.

A FORECAST of the present condition and probable yield of the seed crops can now be made, and on the whole it is satisfactory to know there is a better prospect generally than was evident at this time last year, though the frequent heavy storms about the country are not without serious danger to some subjects. The seed-grower may be said to live in a state of constant hopefulness, mingled with some amount of anxiety.

Peas.—Early dwarf wrinkled Peas promise to be very scarce and high in price; there was a much reduced quantity of stock seed to sow in the spring, owing to the heavy drain upon the stocks of dealers through the scarcity which prevailed last year; and, further, owing to the high prices which ruled during the winter, there was every inducement to sell. Then, on account of the imperfect condition in which the crops were harvested last season, germination proved indifferent, as could be seen in the case of many of the breadths sown for seed. Gradus, a Pea always in large demand, is more plentiful than last year. No wrinkled Pea is expected to yield more than an average crop, even in cases where there was a good plant. Slugs thinned the plants in all districts on account of the wet weather which prevailed just as they were through the soil. In New Zealand, where Peas are largely grown for seed purposes, there is also a shortage of crops, and in no case a full one. Germany suffered much from destructive storms at the end of April. Reports from Canada state that the Pea-weevil is at work among the Pea crops more assiduously than ever, and there is reason to think that from this cause the time is approaching when Canadian-grown Peas will cease to be imported on account of the deterioration of the Peas from this cause. The Pea crops in the United States will not be sufficient, it is said, for home requirements; indeed, large orders have already been placed in this country. The early round varieties are most largely grown in the States, being the leading sorts, and they suffered severely from keen frosts, which happened at the time when the plants were in bloom.

Broad Beans promise to be a fair crop, and the plants in Lincolnshire and other Bean-growing counties appear to have suffered less from the smother-fly than in some of the more southerly districts.

French Beans.—Both Dwarf and Runner Beans suffered on account of the heavy and continuous rains which followed sowings, germination being weak; this fact is especially noticeable in the breadths of Dwarf Beans sown for seed purposes. The plants which survived have set pretty well, despite the sunless weather, but warm sunshine and drying weather are much needed.

Brassicas = Cabbage.—Not for many years past have the Cabbages planted-out for seed holted into flower in spring so numerous as this season, and this is traceable in a large measure to circumstances having made the planting-out later than is usual. Breadths are therefore short of seed-bearing plants, and Cabbage-seeds promise to be dearer in price than they have been for some years past. The crops of early Broccolis are by no means plentiful, the frosts having destroyed many of the plants. Savoy Cabbages, Brussels Sprouts, and Borecoles are an average crop. Cauliflowers grown for seeds in Italy are being harvested in good condition and promise an average crop, as also do the Dutch-grown varieties.

Lettuce is a good crop; so also is Parsnip and Onion. The crops of Radish-seed in France and Germany and also at home promise well. The seed harvest in California is at present somewhat

uncertain; and if the growers in that state succeed in harvesting good crops, it is doubtful if the results from such seeds will be equal in quality to what is grown in this country. It appears to be the opinion among experts that root-crops grown in California, such as Radish, Carrot, Turnip, &c., may not show such good results as English seed; the reason for the harbouring any impression of this kind being that the incidence of the season will probably develop a tendency to leafage rather than to root development.

Turnips.—Early varieties, such as the Milan and the American strap-leaved types, promised a scarce crop both at home and abroad; and prices are expected to rule higher than usual.

Field Turnips and Swedes are fairly abundant; and as there are fair stocks of seeds on hand, prices will not be high. Mangel Wurzel seeds promise to be plentiful and cheap.

Rape.—There is a very short crop in Holland, but much greater breadths were sown in this country than is usual for seed purposes. Some of the English samples are poor in comparison with that which is Dutch-grown, owing to a great extent to the impatience of the farmers to harvest, thresh out, and market their seed crops as quickly as possible. There will be, on the whole, enough seed to meet demands.

Carrot.—The latest advices from the seed-growing districts in France are to the effect that the maggot is prevalent in the flower-heads; it has worked great havoc among the seed crops of late years. This visitation is reducing the average yield; and it is a fact that shorter breadths than usual were put out for seed-production.

The **Potato** crop promises well generally. The early crops, which it is usual to dig while the haulm is green, did not yield plentifully. In the Potato-growing districts of the Midlands, very little signs of disease have put in appearance so far. *Pisum.*

REMARKS ON THE CONDITIONS OF THE FRUIT CROPS.

(See Tables, ante, pp. 72—77.)

(Continued from p. 96.)

4, ENGLAND, MIDLAND COUNTIES.

BEDFORDSHIRE.—The season of 1903 will be remembered by many fruit-growers as one of the most disastrous on record. In the Plum and Prune districts of this county, about Eaton Bray and Stanbridgeford to Cheddington in Bucks, the growers have suffered severe losses; some individuals estimate their personal losses at from £500 to £800, while the total amount must run into some thousands of pounds. The frosts of April and again in May did much damage to most fruit crops, except in a few favoured districts, the heavy rains subsequently, with extreme heat and a long dry period following, completed the mischief. *A. Lewis Castle, Ridgmont.*

— What looked likely to be in the early spring a most promising season, has turned out a complete failure here and in this district, for there is nothing, with the exception of a few Strawberries and Gooseberries. *Richard Calvert, The Woburn Abbey Gardens.*

— With the exception of Strawberries, and less than a third of a crop of small fruits, the fruit crop here is a failure. The spring being a very early one, fruit prospects were promising up to April 16. Then there came a heavy fall of sleet, and to cap this followed 7° of frost; and altogether we had 41½° of frost from April 16 to 25. *Henry Nimmo, Cranfield Court Gardens.*

BUCKINGHAMSHIRE.—I never knew a worse season than the present for hardy fruit, owing to the spring frosts. Frosts of 12° and 14° were registered at this place night after night from the middle to the end of the month of April.

Pears and Apples gave great promise, being well furnished with fruit-buds, but very few escaped the frosts, and many young trees are quite bare of fruit. Peaches, Nectarines and Apricots that were protected have suffered in just the same manner. At Wexham Park gardens we have had to thin the fruits of only one Peach-tree, viz., Early York. The east winds which prevailed in the spring brought much aphid. Plums and Cherries are almost a failure. *John Fleming, Wexham Park Gardens, Slough.*

— The spring of 1903 will long be remembered by gardeners, the promise of good crops having been most favourable; but the hard frosts of April and May destroyed all our hopes. In these gardens the Pear crop in our years is good; this year the fruits may be counted on the fingers of one hand. Apples are very partial, some varieties having very good crops, amongst them being Bramley's Seedling, Cox's Orange Pippin, Lane's Prince Albert, Worcester Pearmain, King of the Pippins, and Tyler's Kernel. Bush fruits generally were an average crop, and Strawberries were plentiful and excellent. Cherries, which are much grown in this neighbourhood, are failures in most cases, and the only variety carrying a good crop is Napoleon Bigarreau. *Chas. Page, Dropmore Gardens, Maidenhead.*

— It was generally expected that after the very severe week's frost that we had in April, when the fruit-trees were in full bloom, that much mischief would follow; and now the extent of it is plainly apparent, for a worse crop of fruit generally has not occurred within my experience of over forty years. *S. G. Miles, High Wycombe.*

— Although the prospects early in the season were very encouraging for a good fruit year, the trees being laden with blossoms, the severe weather during April destroyed almost the whole of the bloom; and in some orchards many acres in extent not a single fruit of any kind is to be found. On the evening of April 15 sleet and snow fell for about two hours, followed by 12° of frost and a bitter north wind; 12° of frost was also registered on the mornings of the 16th, 17th, 18th, and 19th, and 8° on April 20. *W. Hedley Warren, Aston Clinton Gardens, Aylesbury.*

— This is the worst year we have had for twenty-eight years. Strawberries are the only crop we have. Out of an orchard of over 100 acres we have not a bushel of Apples, Pears, or Plums. Our best Strawberries have been The Laxton, Royal Sovereign, Fillbasket, Trafalgar and Climax. *J. Smith, Mentmore Gardens, Leighton Buzzard.*

CHESHIRE.—Apples owing to the severe frosts in the middle of April made hardly any flowers. The few which set fell off in the cold winds of June. Plums and Damsons were in flower when the severe frost came, and none set; Damsons are a very serious loss to cottagers. Apricots, all fell off when small, the foliage being much damaged by April frosts. Gooseberries are an abundant crop, and so are Currants. Strawberries did not swell and were poor and seedy. *C. Wolley-Dod, Edge Hall, Malpas.*

DERBYSHIRE.—With one or two exceptions a fruit crop does not exist hereabouts, there being no Pears, Plums, or Damsons, and very few Apples and Cherries. Currants, black and red, are under average and small, owing to the prolonged drought and cold nights. *J. C. Tallack, Shipley Hall Gardens.*

— The fruit crops in the gardens here and neighbourhood are the worst we have had for some years owing to the late spring frosts. Apples, Pears, and Plums are a failure; Cherries, Morellos, only moderate; Strawberries and Red Currants under average, Black Currants and Raspberries a failure. *W. Chester, Chatsworth Gardens.*

HERTFORDSHIRE.—The fruit prospects in this locality are extremely bad. The three most important, viz., Apples, Pears, and Plums, are practically a failure, which is due to the severe and prolonged frosts during the month of April. I have, on the whole, never known such a bad fruit year. Strawberries have, however, never been better. *E. Beckett, Aldenham House Gardens.*

— I regret having to report the almost total destruction of the fruit crops hereabouts, brought about by frosts which occurred from April 13 until the 25th, which varied from 4° to 12°. Of Apples, Pears, Plums, Apricots, and Peaches we have none, and the same might be said of Cherries, although when protected on walls there are a few fruits, but these are poor. Bush fruits are about one-third of a crop. Strawberries an average, but of small size. *E. Hill, Tring Park Gardens, Tring.*

— No fruit whatever to speak of in these gardens of over 12 acres. There was a good show of Pear-blossoms, and the trees were in full blossom when the April frosts destroyed them. Apples were not in blossom, but the frost cut all the bloom-buds, and they consequently did not expand at all. *T. B. Morle, Frithsden Floral Gardens, Berkhamsted.*

— The Czar Plum-trees have fair crops; other varieties very scanty, or none. *Thos. Rivers & Son, Sawbridgeworth.*

— This year here the crop of fruit is very small. Strawberries are the only kind which I can say were of average quantity and quality. Dessert Cherries were under average in quantity, but the quality has been very good; Morellos are an exception, being good in both points. Apples generally did not bloom so profusely as usual, but there was a great show of bloom on Pears, Plums, Cherries, Peaches, Nectarines, and small fruits; and all were very early, with the exception of the Morello Cherry, which was an unfortunate state for them to be in before the long term of winterly weather which set in on April 12, which not only ruined the embryo fruit; it checked growth and made it particularly liable to the ravages of insects, and caused much labour to be spent on cleansing the trees. *G. Norman, Hatfield Gardens.*

LEICESTERSHIRE.—The crop of Apples, Pears, and Plums for the year 1903 is the worst on record, it having been ruined by the severe frosts and continuous cold winds during the months of April and May. The small fruits suffered severely; of Black Currants there are none, Red Currants are scarce and poor in quality. Raspberries were very much damaged by cold winds, but they made a second growth, and the crop is an average one, but unusually late. Gooseberries have turned out better than at one time we anticipated they would do, but the crop is much below the average. The only redeeming crop of fruit is the Strawberries; although many of the best flowers were damaged there has been a good crop of excellent fruits. *Daniel Roberts, Prestwold Gardens, Loughboro'.*

— All kinds flowered well and unusually early, owing to the months of February and March being much warmer than usual. Pears were in full bloom when the two weeks of continued frost (April 11 to 25) commenced, and the Apple-blossom was ready to open. The frosts continued to vary in intensity, but very little damage appeared until the 19th, 20th and 23rd, when the thermometer on the stand at 4 feet above the ground registered 25°, 25° and 23° respectively, and that on the grass 18°, 19° and 15°; this long-continued frost made the mean temperature of April 3.5° below the average for the month. Previous to this I had never known Apple-blossoms destroyed by frost before they opened, and cannot remember such a failure in the autumn fruit crop as we have here this

season. All varieties of Apples have fared alike. Gooseberries escaped with three-fourths of a good crop; owing to the earliness of the season they had enough foliage to protect the fruits. The Loganberry is the hardiest fruit we have here; it went through all the frost without injury to leaf or fruit. Raspberries, by its side, were much damaged. Strawberries had only a few flowers forward enough to be damaged, and have given a heavy crop of fine fruits. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

SHROPSHIRE.—I have a few Bramleys, Cox's Orange Pippin, Lord Suffield, North Green, Hawthornden, new, and Bess Pool. Fruit crops, indeed! In the whole course of my gardening career (fifty years) I never saw such a scarcity. In short, there is an absolute fruit famine in this district. Strawberries and Gooseberries are our best crops, Black and Red Currants and Raspberries only poor. *A. S. Kemp, Broadway, Shifnal.*

— Apples, Pears, Plums, and Apricots are a complete failure. I have not seen anything like it during my forty years' experience here. Raspberries are a splendid crop, and that is all I have to report. *James Loudon, The Quinta Gardens, Chirk.*

STAFFORDSHIRE.—This is the worst fruit year that I remember. Of Apple-trees most of the trees have not a fruit upon them, while the others have but a few. Of Pears and Plums there are practically none. Sweet Cherries the same; while the Morello variety has a middling crop of fruit. Red and White Currants are a fair crop, while hardly a fruit is to be found on the Black varieties. Raspberries are poor in quantity and bad in quality. Strawberries were a fairly good crop, but the season was soon over owing to the drought. Not a fruit to be seen on the Walnut, and the Nuts on the Cobs and Filberts are few and far between. *Geo. Woodgate, Rolleston Hall Gardens, Burton-on-Trent, Staffs.*

— Fruit crops in this neighbourhood are extremely scanty. The Loganberry is fruiting splendidly on plants growing on walls, proving a fine substitute for the Raspberry. Strawberries very good. *W. Bennett, Rangemore Gardens, Burton-on-Trent.*

— This is about the worst season I ever remember for out-door fruits. There are very few Apples, Pears, or Plums. Plums were very full of bloom, but the sharp frosts we had completely killed them all. I never saw Raspberries and Black Currants so much injured, the tips of many of the shoots being killed outright. Strawberries and Cherries being late in blooming escaped and have been an average crop. *John Wallis, Woore Gardens, Newcastle-under-Lyme.*

WARWICKSHIRE.—This is a most disastrous year. Fruit, with the single exception of Strawberries, being below the average, and in the case of Apples nearly a total failure; of Pears, Plums, and Apricots, very few; Peaches where the trees were covered with protective materials, an under average crop. Bush fruits are here a complete failure, although a few miles off Currants are abundant. *James Rodger, Charlecote Park Gardens, Warwick.*

— During my experience of more than fifty years, I have not known fruit crops so bad within a radius of, say, ten miles, as this year. Apples, Pears, Black Currants, Plums, Damsons, Apricots, Peaches, Nectarines, Cherries, and Walnuts are quite a failure. *Thos. Masters, Estate Office, Lower Shuckburgh, Daventry.*

— I examined a good many farmers' orchards round about this neighbourhood, and found the whole of the trees of Apples, Pears, and Plums practically fruitless. One, the largest I visited, the farmer told me he had yearly carefully attended to the cleansing and spraying of his

trees; that the fruit buds were all killed long before they had time to open. Walnut trees are also without fruit. Of Filberts and Hazel Nuts there are a few. The fruiting of Red and Black Currants appears to be partial. Raspberries are not at all satisfactory. Strawberries were plentiful and of good quality. Blackberries about our lanes and woods are flowering freely, and promise a good yield should the autumn be one sufficiently genial for their ripening. The rather unusual repeated spring frosts and also mid-summer frosts have much to answer for the decimation of our fruit crops, and much sympathy will be felt for those people whose living in a great measure depends on the fruit yield of their gardens. *W. Miller, Berkswill.*

(To be continued.)

NURSERY NOTES.

MESSRS. SANDER & SONS.

In the famous Orchid establishment of Messrs. Sander & Sons, at St. Albans, year by year the hybrid Orchids have encroached on plant-house accommodation formerly devoted to other subjects until at present the greater part of the houses are filled with the plants raised on the place, and of which some thousands of magnificent plants of new hybrid Cattleyas, *Laelias*, *Laelio-Cattleyas*, &c., are now in sheath, or showing flower for the first time. In flower also are a large number, especially of the fine strain of *Laelio-Cattleya* × *Bletchleyensis* and *L.-C.* × *Martineti*, examples of which have recently gained so many honours at the flower-shows of the season.

In the preparation of leaf-soil, in which all the hybrids at St. Albans are grown, the plants assume large proportions in a short time, the fine vegetation and flowering quality being due to a wonderful root development which the potting material used and the careful culture given the plants induce. Flowering for the first time is a pretty light-coloured variety of *L.-C.* × (*C. Schrodera* × *L. glauca*), a new cross between *L. tenebrosa* and *L. crispa*, and others.

Eight warm-houses, entered from the corridor, contain new hybrid *Cypripediums* in all stages, from the smallest seedling to the flowering plants, one specimen of *C.* × *Lord Derby* being over 2 feet across. An adjoining house contains the collection of named rare varieties of *Cypripedium* insigne; and in a warmer one are good specimens of *C. callosum Sanderæ*, *C. Lawrenceanum Hyeaunum*, *C. bellatulum album*, and other rare kinds, some of which bear cross-fertilised seed-vessels. Crossing and raising hybrid *Phalaenopsis* and *Odontoglossums* is being actively pursued, and already some very interesting results have appeared. One house is filled with hybrid *Phaius*, the result of intercrossing all the species available, and many are in bloom. *Phaius Humbloti* has been much used, and some good forms of the species are still in bloom. Among a number of hybrid *Sobralias*, *S.* × *Dellense* shows itself to be a very free-flowering and pretty variety.

That hybrid Orchids can in time be grown to form as fine specimens as large imported masses is proved by some now, and recently, in flower at St. Albans, and among which are *Laelio-Cattleya* × *Canhamiana* with eighteen flowers; specimens of *L.-C.* × *Martineti* with from twenty to twenty-five flowers, and others of different hybrids of equal beauty.

A large number of houses are still filled with imported species. Some ranges of good *Odontoglossums*, chiefly *O. crispum*, have yet many in flower, and in the cool-houses batches of *Masdevallias* give bright colour. One house is filled with *Miltonia vexillaria* just over bloom. With the showy kinds are a number of pretty botanical species, including *M. triaristella*, *M. trichete*,

M. muscosa, and the curious Brazilian *M. Forgetianum*. A long range contains thousands of plants of the showy forms of *Cattleya*, the larger number being of *C. labiata autumnalis*, which is in great demand for cut flowers. A very long house is filled on one side with a large importation of *Dendrobium Wardianum*. *Vanda cœrulea*, imported in large quantity this year, came in fine condition, and are now well established.

Among the rare *Cattleyas* in flower is a very handsome and distinct form of *C. Warscewiczii* with white flowers, the labellums having a delicate marbling of rose-purple. White forms of what is often called *Cattleya gigas* are very uncommon, and this seems to be one of the most delicately tinted.

Among other pretty things noted were the white and crimson *Pachystoma Thompsoniana*, some neat plants of *Promenæa citrina*, *Cirrhæa Warreana*, and other curious species; and in the new plant-houses, *Nicotiana Sandera*, which is one of the most beautiful and useful flowering plants of recent introduction, seemed to fill the house set apart for it with its profusion of magenta-crimson flowers. *Asparagus myriocladus* was very beautiful; and the variegated *Selaginella Watsoniana* seemed to indicate that it would be grown extensively when it became better known.

THE RESTRICTION OF THE FOLIAGE AND SHOOTS OF THE GRAPE-VINE.

THE writer had this question to settle lately—whether it would be advantageous to permit some young spring-planted Vines to make an almost unrestricted growth, or, on the other hand, whether it would ultimately, as well as immediately, prove more beneficial to restrict growth solely to the young canes. It may be of interest to detail the reasons that induced an adherence to the latter method. The root-range when borders are completed is rather contracted, and for that reason each Vine has laid upon it the duty of producing several rods, thus securing to each a fair proportion of border. Again, the soil obtainable is so sandy that exhaustion looms before one in the near future, and thus the desirability of limiting the output of roots is forcibly apparent. I am reckoning on a three-foot wide border of sandy soil somewhat liberally strengthened with certain manurial agents to meet efficiently all the wants of the Vines for two years. Top-growth is rigidly restricted to the number of canes required to furnish the house with fruiting-rods, and the only foliage on these canes is one leaf to each bud. I have been so curious as to examine the borders to discover what progress the roots have been making. Perhaps the nature of the soil may have had an influence, but I thought it very remarkable that what are known as quill-like roots, which it is well known perish during the resting period, are not to be found, but quantities of very fine roots that branch off from the leading ones, in some placed like matted network. The further question suggests itself—Is there anything to be gained under any conditions through allowing Vines to ramble at will, and produce sometimes more growth and foliage than it is possible to arrange within the limits of the available training-space? Or, to put it in another way—Is the benefit supposed to accrue to young Vines from unrestricted growth, with its consequent rush of roots through the borders, of actual value to the future of the plants? From one point of view it is apparent that the system is radically faulty in using up the border more rapidly than the requirements of the Vines call for. Of course, as supposed available assets, there is the extra stored-up sap ready to come into action on the renewal of active growth; but its value is more problematical than assured.

It is, moreover, clear that once concede the point that there is a saving of soil—and may it not also be said of vitality in the Vine itself?—by restricting growth and foliage to the lowest limit, that what is suitable for Vines in the earlier stages of growth must be equally so in maturity and age. It is very apparent to those whose visits to gardens are rather extensive that in not a few of them there is a tendency to restrict foliage more than formerly, every leaf being accorded space to secure whatever of sunshine and light and air is going. It is also certain that this practice does not lessen the fertility of the Vines or the quality of the Grapes—even the popular theory that a thin covering of foliage, though essential to the finishing of white Grapes, is detrimental in the case of black ones, being open to discussion. A light crop of foliage can certainly be said to be distinctly beneficial as regards wood and bud ripening, and in the matter of insect appropriation, a hard, sun-lightened leaf is by no means a feeding-ground that either thrips or red-spider care to attack. And as regards mildew, I should say it would be impossible for it to grow at all.

There is nothing whatever in these theories, correct or not, at variance with what we know obtains in the case of other fruits. Take so common a fruit as the Gooseberry, train it as a cordon, thus giving it the essential of light and air, and we secure large crops, almost certain year after year, of the very finest quality fruits. The same thing obtains in the cases of the Apple, Pear, Plum, and Peach—limit the shoots to the merest requirements of the space to be covered, and we seldom fail in obtaining the best results. Need it be added that the same principle extends to plant-culture in pots, e.g., the *Chrysanthemum*; to flowers in borders, note the common *Dahlia*, *Marigold*, or *Aster*; to vegetables, as, for instance, the *Cucumber*, *Vegetable-Marrow*, *Tomato*, down to the commonest herb. Why not then to the Grape-vine? B.

SUNNY HILL, LLANDUDNO.

IN the *Gardeners' Chronicle*, December 22, 1900, an illustration of the residence of Joseph Broome, Esq., was given, together with views in his beautiful rock-surrounded garden; and at different times we have remarked on the luxuriance of the many showy subjects contained in it.

ORCHIDS.

These plants continue to fill the greater part of the glasshouse accommodation, and the greater proportion of them are in very satisfactory condition, the *Odontoglossums* being especially remarkable for vigour of growth and floriferousness. In the two cool houses devoted to these plants there is a fine show of the best type of *O. crispum*, the main portion of which seems to be later to bloom than is the case in some places, and the quality of the blooms much finer than those usually seen at this season. The greater part are of the large-flowered, white type, but there are some spotted varieties; and one very promising blotched form of *O. c. Lehmanni* is in bud. There is also a good show of flowers on the fine plants of *Odontoglossum luteo-purpureum*, one of which has a nine-branched spike carrying more than fifty flowers; *O. aspidorhinum*, and the now uncommon *O. cristatellum*, are good; and *O. cirrosum*, *Epidendrum vitellinum*, a brilliant batch of *Masdevallias*, cool house *Oncidiums*, &c., materially assist the display.

CATTELYAS AND LÆLIAS

flower most profusely, and it is remarkable that although the plants do not grow nearly so large as in some collections, they give a larger proportion of flowers. The flowering of *C. Mossiæ* and *C. Mendelii* is nearly over, and the best

display is now made by the *C. Warscewiczii* varieties, which, like the rest of the *Cattleyas*, are no doubt induced to flower so freely by the clear air and bright light with which the district is favoured even in the dull season. One fine specimen of *C. Warscewiczii* in a comparatively small pot has three spikes, one of seven and the other two of five flowers each.

An example of the light-coloured "gigantea" class has a good show of magnificent flowers, and even the smallest plants are flowering well, and several have five or six flowers on a spike. There were also noted *C. eldorado Wallisii*, *Anguloa uniflora Turneri*, *Lælia tenebrosa*, *L. purpurata*, *Miltonia vexillaria*, *Odontoglossum hastilabium*, *Oncidium juncifolium*, *Phalænopsis amabilis Rimestadiana*, a large specimen of a fine bluish-white *Sobralia*, and various other interesting things, including a number of *Cypripedium Curtisii*, *C. Mastersianum*, *C. bellatulum*, *C. × Swanianum*, *C. × selligerum*, *C. Parfshii*, &c., in bloom. Mr. Broome is one of our oldest Orchid-growers and gardeners, and many years ago, when at Wood Lawn, Didsbury, took a leading part in horticulture in the Manchester district, where, despite his present success, he produced in the favourite plants of that time far finer examples than have been seen recently, and among which may be cited the noble specimen of *Vanda teres Andersoni* with 250 flowers, and which was illustrated in the *Gardeners' Chronicle* at the time.

THE PLANT-HOUSES.

One small warm-house is nearly filled with fine specimens of *Eucharis grandiflora*, which every year produce a fine show of flowers. *Stephanotis grandiflora* and *Cape Gooseberry* grow on the roof. Others have stove plants and Orchids growing together; and in one, the singular *Aristolochia ridicula* and *Gloriosa superba* are in bloom. The cold greenhouses have a fine display of *Malmaison Carnations*, *Francoas*, *Kalanchoe flammea*, some profusely flowered *Fuchsias* (of which the very handsome double *Phenomenal* was the best), showy *Petunias*, *Ivy-leaved Pelargoniums*, and other flowers.

THE OUTDOOR GARDEN.

Although sheltered by the Lesser Orme Head, the more distant Great Orme, and other rocks, some of which rise directly behind the garden, the site is at times swept by strong winds; hence Mr. Broome has arranged a series of gardens, each hedged in by *Roses*, *Penzance Briars*, *Privet*, *Fir-trees*, and other subjects which give shelter to the plants. Evidence that it has been a very peculiar season, not continuously good for gardening, is seen on the trees all around the district, the unusually early growths and leaves having perished from cold in April and May, and for some time the damage must have made them very unsightly. Now, however, a new growth has been made, and although in the fields and on the rocks the damaged and the perfect foliage is seen together, in the garden the unsightly, injured growths have been removed. Nevertheless, notwithstanding the care which Mr. A. C. Axtell, the gardener, gives to his charge at Sunny Hill, there is evidence that with some subjects he has had more than the usual trouble, and with less satisfactory results. For example, the tuberous *Begonias*, which at this season have in other years filled the beds with brilliant flowers, are only now commencing to bloom; the *Gladiolus* and many other plants are more backward; and the outdoor beds of *Tuberoses*, which in former years have sent up spikes very freely, have this year so far only sent up a few. The crowns, however, are vigorous, and will be lifted to flower late in the year under glass.

The first little garden entered had a fine show of *Roses* and other flowers, *Rosa rugosa* in large

bushes being very effective. The bank above in front of the house is kept as a natural garden, the grass being planted with Crocuses, Daffodils, and other bulbous plants, and the steeper part with Hypericums and Vincas.

The next, a sunken garden, has the large specimen of Crimson Rambler Rose which formed the Supplement of the *Gardeners' Chronicle*, December 22, 1900, in the centre. It is good this year, but not nearly so fine as it has been in better seasons. The Tea Roses, the beautifully-tinted purple foliage of which admirably sets off the flowers, are well in bloom; and large masses of *Galega officinalis alba*; *Alstroemeria aurea*, which, not content with filling the bed, comes up in the walk; showy *Aster speciosus* and other large-growing perennials, and on the wall on one side an enormous *Ceanothus rigidus*, which annually produces hundreds of heads of blue flowers. Around the garden rockeries are arranged plants with Alpines; *Veronica prostrata*, *Gentiana septemfida*, the Saxifrages, *Genista tinctoria flore-pleno*, and other things form great masses of bright colour. In several places in the garden the Edelweiss forms dense masses, and is quite at home; so also the hardy *Cypripediums*, and some other subjects which are not generally satisfactory in gardens.

In several sections of the garden Carnations are the chief feature. In one the beds are edged with *Statice Armeria*, which give effective colour. One little garden has Lilliums, in the hedge *Spiræa arifolia* sending out immense sprays of cream-white flowers, and S. Antony Waterer a profusion of bright rose blooms. Sweet Williams make large patches of colour, and Phloxes, Delphiniums, and other summer flowers are at their best. In some of the sheltering hedges great masses of *Fuchsia Riccartoni* show more flowers than leaves; *Rosa polyantha* is equally profuse; *Deutzia crenata flore-pleno*, *Choisya ternata* and *Philadelphus coronarius* appear to advantage, and other of the larger-growing flowering shrubs are used, and in addition to giving their show of blooms in season, assist in protecting the less robust things planted within.

THE KITCHEN GARDEN

and fruit trees planted in different parts of the garden also indicate the peculiarities of the season. Some things which would in the ordinary course be now in perfection are only beginning to turn in. Of Plums, there may be said to be no crop. Apples are irregular, some of the trees having none, while others are heavily laden with fruits.

The natural rocks behind the kitchen garden are scarcely less beautiful than the garden itself, its velvety grass and moss being thickly set with *Helianthemums*, dwarf wild roses, *Geranium sanguineum*, and other wild flowers. The floral decorations in the dwelling-house illustrate the beauty of grouping Carnations and Francoas in the hall; and in the drawing-room, in which is a fine collection of water-coloured drawings, a group of *Kalanchoe flammea* and some cut Orchids are bright and effective. Outside the window is a little cot, from which Cocoa-nuts with holes in them are suspended. A colony of several kinds of "Tits" continually pass in and out of the interiors of the nuts, which are renewed as the contents are cleared out by the busy birds.

HOME OF THE COCOA-NUT.—According to the recently-published statement of the official in charge of the Cocoa-nut trees of the Federated Malay States, the land everywhere along the coast of Selangor and for miles inland is most suitable for these trees—a perfect home for Cocoa-nuts. The trees come quickly into bearing, produce grand crops, and, owing to soil fertility, absolutely require no manure. Truly it would be hard to find a more fitting locality for the growth of the Palm.

FIG 45.—CACAO FRUIT WITH PORTION REMOVED SHOWING SEEDS.

CACAO OR COCOA (THEOBROMA CACAO).

THERE are but few plants that have had such a varied range of usefulness and established such a rapid reputation and popularity in so short a space of time as the Cocoa, or, perhaps more properly, the Cacao plant (*Theobroma Cacao*), and probably no plant has ever had the

distinction of playing such an important part as a social reformer, for in this latter respect everyone knows that, in the hands of Messrs. Cadbury, a new and model village has sprung up near Birmingham under the name of Bourneville, which will ever be associated with the celebrated plant from the forests of the Amazon and Orinoco basins.

That everything connected with the preparation of food products and beverages should be of the cleanest and most healthful character is most important, and the situation and surroundings of Bourneville specially tend to that direction, for the Cocoa-seed now enters so largely into the composition of the choicest confectionery that its manufacture into the thousand-and-one forms now seen in commerce has become almost one of the fine arts; and a Cocoa village, so to speak, in the midst of pleasant surroundings has no doubt assisted in bringing the product itself, upon which the villagers gain their livelihood, more prominently before the public.

Though the value of Cocoa as an article of food in Europe is by no means of recent origin, its development to the extent it has now assumed may be dated back not farther than ten or fifteen years. Its popularity is due to a great extent to improved methods of preparation, by which a cup of cocoa or chocolate can now be made in a very few minutes, which, less than forty years ago, took at least half-an-hour to extract by boiling the properties of the Cocoa nibs. To meet the increased demand the Cacao-tree has become widely cultivated in most tropical countries. Amongst the British West Indian Islands, Trinidad has always stood in a foremost position for the quality of its Cocoa.

In Sir Daniel Morris's *Report on the Economic Resources of the West Indies*, he states that Cacao cultivation has been established in Trinidad from its earliest days. The total area under regular cultivation in 1879 was 24,158 acres, and though the average at the time the report was written was not given, it was estimated at a considerably higher figure. In 1881 the exports of Cacao were of the value of £266,613, which had increased in 1895 to £620,634.

In Jamaica the report said that Cacao cultivation was introduced by the Spaniards, and in 1671 there were sixty-five walks in bearing, and many new ones in cultivation. These had practically disappeared soon after the English occupation, and the present cultivation was not more than thirty years old. In 1876 the value of Cacao exported from Jamaica was only £1,286, which had increased in 1896 to £17,528. In most of the other islands Cacao has been cultivated with more or less success, besides which it has been successfully introduced into Ceylon, as well as into British India, where it is said trees raised from seed come into full bearing at the age of five or six years, after which period they yield about 150 lb. of seed annually.

For the successful cultivation of Cacao, besides the requisite soil and climate, an equable and regular rainfall, as well as some protection or shelter from prevailing winds, are necessary. If shade-trees are required, they should be put in the ground either before or at the same time as the Cacao-plants, if they are intended to provide temporary shade for a few months. In the West Indies, Bananas and Plantains are put one between each Cacao-plant, and these last for two or three years; while permanent shade-trees, which are chiefly hard-wooded plants, are placed at distances of about 40 feet, and in three or four years afford a permanent shade. By giving ample space between the Cacao-plants, many other plants of a useful character may be planted between them without impoverishing the ground during the first two or three years. They assist in keeping the ground cool and moist and free of weeds. In planting belts of trees around plantations as a protection against winds, such

FIG. 47.—STEM OF CACAO WITH FRUITS AND FLOWERS.

trees should be of some economic value, so as to give some return.

Although a Cacao-tree is in fruit more or less all the year round, the seasons when the crops are most abundant are in May and June, and the October and November. The quality of the Cacao-beans or seeds depends largely on the variety, of which a large number are in cultivation, known chiefly by the form, size and colour of the fruits. Cacao-seeds contain naturally about half their weight of oil or fat, known as Cocoa-butter, which is expressed; and in consequence of its sweetness and freedom from rancidity, is largely used in medicine in the preparation of suppositories, as well as in ointments, cosmetics, coating of pills, &c.

Commercial cocoa of the cheaper kinds are mostly composed of a small proportion of the pulverised seed mixed with starch or flour, hence the thickened beverage produced by them. The "Cocoa Essences" or "Cocoa Extracts" of the best makers, being the pure powdered seed, produces a thinner or more fluid beverage, but one in every way more wholesome, nutritious, and invigorating.

Without going into figures as to the increased consumption of cocoa in this country, it will suffice to say that while in 1820 only 267,000 lb. were consumed, at the present time the consumption in the various forms of cocoa and chocolate amount to some 20,000,000 to 30,000,000 lb. *John R. Jackson, Clarendon, Lympstone, Devon.*

To the above note we are fortunate enough to be able to add the comment of Mr. Hart, of Trinidad, now on a visit to this country:—

The illustrations which we publish to-day are singularly alike in character and appearance, although one is English, the other is truly West Indian. They represent some of the work of the great English firm of Cocoa manufacturers, the Messrs. Cadbury of Birmingham. This firm has within recent years become the proprietors of a valuable Cacao estate in the Maracas Valley, Trinidad, where, we learn, the same care which has always been shown for the interests of their employes in England has also been extended to their West Indian staff. In this way the Messrs. Cadbury have set an example for good to the manufacturing world, for they try to do all in their power to elevate and render happier the lives of all who are employed in their service. In Trinidad, we learn that the firm has voluntarily introduced many beneficial reforms, and the policy adopted is likely to have important results owing to the unostentatious and thoroughly liberal manner in which the projects are conducted. They are leading also in the recent effort at fruit production into Trinidad, by selecting and planting on their estate the finest class of tropical fruit-trees it is possible to procure. The advent of Messrs. Cadbury into Trinidad has been welcomed by all who have interests in that Colony, and the wish is freely expressed that firms of similar standing would come and do likewise.

The West Indian stream represented in the Supplementary Illustration is known as the Maracas River, which, followed to its source, leads to the foot of the Maracas Falls, where a mountain stream falls over a precipice some 300 feet in height. This spot is a favourite place with American and English tourists, for in few places in the Island can such luxuriant growth of tropical vegetation be seen within such easy distance of the port of landing. It is truly a tropical treat, and once visited is not easily forgotten. The Cacao-tree, to call it by its original name instead of the modern or trade name of Cocoa, flourishes best in humid valleys, and in the district in question the plant may be observed growing in the greatest luxuriance. The crop is generally continuous, as the fruit ripens through a greater part of the year, and provides suitable employment for the people at remunerative rates. The district is a healthy one, and malarial fever, common in many other districts, is not in any way a prominent disorder among the inhabitants of the Maracas Valley. *J. H. Hart.*

ROSES IN BENGAL.—The Directors of the Agricultural and Horticultural Society of India have determined to give up the attempt to cultivate Roses in the climate and soil of lower Bengal.

CULTURAL MEMORANDA.

SHOW, FANCY, AND DECORATIVE PELARGONIUMS.

DURING the present month, and preferably in the first fortnight, the propagation of Pelargoniums of the classes named should be undertaken, a moderate increase of the stock being always desirable, from the fact that some of the older plants must be thrown away on account of their inconveniently large size, or for other reasons. The best sort of cuttings are made from well-matured portions of the current season's shoots. They require to be cut through just under a joint, to be furnished with a few leaves, and to have a length of 4 to 6 inches—a heel of old wood is unnecessary, and is rather a hindrance than otherwise to rapid rooting. Place the cuttings in sandy loam to the number of three to six in 4-inch flower-pots, and stand the latter on a sunny shelf in a greenhouse-pit, or the greenhouse itself, affording no shade. Afford water copiously to settle the soil about the cuttings, and afterwards but seldom till roots are formed. A light syringing on warm days is beneficial. In three or four weeks the cuttings will be rooted, and may then be potted singly and treated like the older plants.

The Week's Work.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonsbirt, Tetbury.

Lælio-Cattleya elegans × *L.-C. Schilleriana*.—This plant, being a hybrid, is rather inconsistent in its flowering season, but the majority of the plants flower soon after growth is completed; and when this happens, as it usually does at this season, the best flower-spikes are obtained. The plant, when healthy and vigorous, will sometimes start to grow again immediately, and should this happen growth must be encouraged so as to complete it ere winter sets in. These *Lælio-Cattleyas* should be afforded abundant moisture at the root whilst in active growth, and but a very small quantity whilst resting. Repotting, &c., should be performed when roots are being emitted from the last-made pseudo-bulb; and the compost used should be of a porous nature, using the same ingredients as previously advised for *Cattleyas*. The pots should be well drained, and the plants placed on the stage at the warmer part of the *Cattleya*-house, and where there is plenty of sunlight.

Lælia prestans, *L. pumila*, *L. Dayana*.—These short-bulbed *Lælias*, if they were potted as previously advised, will now be established and making growth, and should not be stinted of moisture at the root. A very light position should be afforded them, so that their new growth will mature properly. Let the plants be freely syringed morning and afternoon, weather permitting.

Lælio-Cattleya hybrids.—The cultivation of *L.-C. Digbyana Mossiae*, *L.-C. Imperatrice de Russie*, *L.-C. Thorntonii*, *L.-C. Maronæ*, does not differ much from that of *L.-C. hybrids* in general. The first two named should receive attention at about this date. Although forming roots fast, the plants should not be afforded very large pots or baskets, and they should be suspended in a moist, warm house, and be removed to cooler quarters when their growth has finished.

Deciduous Dendrobiums.—The present season has not been everything that could be desired by cultivators of *Dendrobies*, much more fire-heat than was good for the plants having been needed; still most of these plants grown at Westonsbirt have made satisfactory growth, and should sunny weather occur during the autumn the new pseudo-bulbs will mature, and afford plenty of flower later on. Many species are finishing this season's growth, the earliest to do so being *Wardianum*, *crassinode*, *aureum*, and the hybrids *D. xantho-*

centrum, *D. Cybele*, *D. Clio*, *D. Aspasia*, and others; and when the end leaf on a stem or pseudo-bulb is fully developed, the plants should be removed to the *Cattleya* or similarly heated house, where more air and light are afforded, but on no account exposing the plants to bright sunshine or ventilating them excessively until inured by degrees to the air and to full sunshine. As the pseudo-bulbs ripen the leaves will turn yellow, but they should not therefore be removed, but allowed to fall naturally. After the growth of the plants is ended for the year, water should be afforded more and more sparingly, not cut off all at once, otherwise the plants will again start into growth; moreover the roots are still active and in need of moisture. All other *Dendrobiums* still growing should be encouraged, so that growth may finish before the days get much shorter.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq. Dropmore, Maidenhead.

Out-of-door Vines.—The generally heavy rainfall has induced Vines to make very strong growth, and the stopping of lateral and sub-lateral shoots will require much attention at the hands of the gardener; and the berries should be thinned forthwith. The *Royal Muscadine* has small berries, and will not require much thinning. It is well to keep the bunches away from the wall with a cleft-stick. If the soil is of a light nature, water and manure-water may be needed, the latter well diluted; and a sprinkling of Thomson's Vine-manure will do good. If mildew appears on the Grapes, syringe forthwith with a mixture of flowers-of-sulphur, at the rate of 5 oz. to 4 gallons of water, a small quantity of soft-soap being added to make it stick. Mix the soap and sulphur into a paste before adding the water, and keep it well stirred whilst using it, and wash it off with clear water twenty-four hours later.

Apples.—The Codlins, if heavily cropped, should have the fruits thinned, the thinnings being used in the kitchen.

Pears.—The fruits of such varieties as *Jargonelle*, *Citron des Carmes*, *Doyenné d'Été*, and *Beurré Giffard* should be eaten direct from the tree, or at best not stored more than a day or two. *Pear-trees* on walls and bushes and cordons generally, if carrying fruit, should be protected from the birds, as, owing to the great lack of fruit, they are sure to spoil such as we have. If there are only a few fruits on a tree, it may be prudent to put them into muslin bags.

Red and White Currants trained on walls should be netted forthwith, and the nets kept away from the fruit by means of forked sticks 9 inches long.

Work in General.—Where fruit-tree stocks are grown for budding and grafting purposes—viz., the Broad-leaved Paradise for Apples, Quince for Pears, and the Wild Cherry or Gean for Cherries—these will now be in a suitable condition for being budded. The buds should be inserted 3 or 4 inches above the soil for dwarf, and 6 to 7 feet for standard trees. If the spring grafts are making free growth, remove the clay and moss, but retain the ligatures for a few weeks longer, unless these are cutting into the rind, in which case they must be replaced with fresh ones.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bicton, Budleigh Salterton, Devonshire.

Pelargoniums.—The show and decorative varieties should now have the current year's shoots pruned to within two or three buds of the base, and be placed in cold frames, the soil in the pots kept dry for a few days, and after that space of time syringed night and morning till new shoots appear, and then be shaken out of the soil, straggling roots trimmed, and be repotted in smaller pots than those in which they flowered. Having potted them, let them be returned to the cold frames and be kept close for a week, afterwards affording full ventilation and applying water with discretion. A suitable soil for these plants consists of turfy-loam three-quarters and decayed manure one-quarter, with enough sand as will give porosity to the whole. *Pelargonium*

cuttings may be taken from ripened shoots and dibbled into pans or shallow cutting boxes in sandy soil and be placed under a frame; afford them full sunshine, pot them when rooted, and treat like the mature plants. The zonal section for autumn and winter flowering, if their pots are filled with roots, may receive manure-water twice a week. Pick off all flower-buds for some few weeks longer, and do not allow the plants to root into the material upon which they may be standing.

Richardias.—Where these plants are grown in pots throughout the year, the exhausted soil should be shaken off the roots, and the longest of the latter shortened, and the crowns potted in soil consisting of loam three-quarters and decayed cow-manure one-quarter. Pots varying from 5½-inch to 10-inch will be the most convenient sizes, placing single crowns in the smallest size, and three in a 9-inch or 10-inch pot. Any green foliage existing on the plants may be retained, and supported with a stake. If the plants have been properly ripened, all the foliage will have decayed, and may be removed. Let the pots stand on a worm-proof border on the north side of a wall, and afford water to settle the soil, but no more for several days, even during dry weather, although the syringe may be plied among them two or three times daily. As soon as growth begins anew, remove them to a sunny situation, and afford water when required for the next eight months. Richardia-plants which are set out in trenches and are beginning to grow should be well supplied with water in dry weather, clear water sufficing if decayed manure was placed in the bottom of the trench. The stock may be easily increased by potting any small suckers or pieces of the root-stock with a bud attached. The varieties Little Gem and the Godfrey are very suitable for growing in small pots. Small seedlings of R. Elliottiana, the lovely, yellow-flowered variety, should be kept rather on the moist side throughout the winter months, or they will perish, whereas established plants may be kept dry in a greenhouse until the new year.

FRUITS UNDER GLASS.

By T. H. C.

Strawberry-plants in pots.—Let the potting of Strawberry-plants for forcing be finished without delay, keeping those potted later separated from the earlier ones, the latter being the first to be forced. Observe carefully all instructions previously given in regard to the treatment of potted plants.

Runners for next year.—Plant out layered runners for the production of next year's supply of runners in a deeply-dug or bastard-trenched, well-manured piece of land in an open situation, at a distance of 15 inches apart in the rows and 2 feet between the rows, having first made the soil firm and level. In the absence of rain, apply water occasionally till the runners take root.

Pot Vines.—Where ripe fruit is required in March and April, the canes should now be almost mature, with bark of a dark-brown tint, and plump and prominent buds. Assuming that the canes have been gradually inured to the outside air night and day, let the pots be stood on boards or slates in the open on a south aspect, and the canes secured to stakes or other fastenings till the leaves fall, maintaining the soil in a moderately dry condition, so as just to prevent flagging. Pinch-in the laterals of later pot Vines, and promote the ripening of the canes by affording air at all times. Next month these Vines may also be placed out-of-doors.

The Early Vinery.—If forcing is to begin in the month of December lateral growth should be well ripened not later than the middle of September, which in the case of aged Vines is not difficult, if the air of the vinery is kept dry, and plenty of ventilation is afforded night and day without artificial heat, excepting during long-continued dull weather. In any case sufficient moisture must be applied at the roots. Young Vines, which usually grow more freely than aged ones, may require artificial heat always, excepting in very warm weather, and the fullest ventilation; and the border to be kept on the dry side, just enough

water being afforded as will keep the foliage fresh. Laterals must be pinched in closely, and insects kept in check.

Ripe Grapes.—Examine the bunches once or twice a week, removing decaying berries, as one decayed berry will spoil the greater part of a bunch. Black Hamburgs lose freshness and colour if kept on the Vine long after they are ripe, more especially if the vinery is kept very dry. A slight amount of shading on the roof helps to keep the fruit fresh-looking, and may be applied after the berries are fully coloured. Ripe Muscats may have a night warmth of 65° to 70°, with a small amount of air admitted by the bottom and top ventilators, and one by day of 10° to 15° higher, with a free circulation of air.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PIGOTT, Bart., Wexham Park, Slough.

Celery.—The main and late crops, even when afforded plenty of manure in the trenches, have their growth hastened if liquid-manure and soot-water be applied at intervals, and a sprinkling of fresh soot once a week when the leaves are wet with dew or rain as a preventative of the leaf-miner. Remove all weeds, suckers, and leaves with split stalks as fast as they can be got hold of. Continue to earth-up the early crop in dry weather, placing just sufficient soil up to the plants, but not burying the tips of the heart-leaves.

Winter Greens.—Those which are well established may be afforded in showery weather a slight dressing of artificial manure if the ground is in poor condition. The later-planted beds should be hoed, and all vacancies filled up. Continue to plant with Coleworts all vacant pieces of ground not wanted for other crops.

Lettuce.—Make a sowing on a south border, and set out the plants when 2 to 3 inches high in any warm part of the garden. If the weather is dry, let drills 2 inches deep be drawn, into which dibble the plants, and forthwith afford water. Stir the soil between the plants in earlier plantations, and do not let them lack water.

Parsley.—Cut back the plants of the early sowings, and if a constant supply is required, let the later sowings be thinned to 6 inches apart, and plant out the thinnings at the same distance apart in cold frames or on spent hotbeds, previously making the soil quite firm, shading and syringing the plants until they are established; after which admit plenty of air, removing the lights in fine weather.

THE FLOWER GARDEN.

By J. C. TALLACK, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

Amaryllis belladonna.—These bulbs at Shipley are retaining their leaves rather late, still the bulbs should now be sufficiently ripened to lift, and early planting is of considerable help to them. The best preparation for them in a cold soil is to well drain a narrow border at the foot of a south wall, and all the better if it be the wall of a hot-house, and plant them one foot deep in a mixture of soil, sand, and brick-rubble. Sternbergias too should now be planted, the narrow-leaved form of *S. lutea* being by far the better one for general culture as it flowers with greater freedom than any of the other species.

Kniphofias, Hydrangea paniculata, and Pampas-grass.—The plants should now be coming into spike or flower, and they will be greatly helped by occasionally affording them manure-water.

Plans.—Much unnecessary labour in propagation and much house-room for wintering tender plants may be saved if at this time of the year, when all the plants in question are before one's eyes, making the matter an easy one, a plan for next year's planting could be thought out and decided upon. Very rarely is a flower garden so well planted that no improvements will suggest themselves, and in any case changes in the scheme of planting may be welcomed, as however good a plan may be, if constantly repeated, it is sure to fail to please.

Herbaceous Borders.—Where perennial Asters, Pyrethrum uliginosum, and others similar, perennial Sunflowers, Helianthums, &c., are made special features of the borders, much attention

will be called for in the matter of securing the plants against the wind. Let them be so fastened that they will have a natural appearance, and that without bringing the sticks and ties too much into view. In order that the mixed borders may have an air of tidiness remove all faded stems and flowers and encourage the growth of annuals, &c., planted in vacant places so that they will cover as much bare ground as possible.

Cuttings of Roses.—Own-root Roses are much sought after by some cultivators, and usually they have to be raised at home. The stronger-growing H.P.'s may all be raised from cuttings inserted in the open ground late in October, but Teas and weak growers generally must be struck under glass protection before the wood has become quite ripe. Deep, well-drained pots filled with sandy soil should be used, the cuttings taken off with a heel, the tips and lower leaves removed, and the cuttings inserted to at least half their length round the sides of the pots, taking care that they are made firm and there is no air space round or under the cutting. A portion of each leaf—the middle lobe by preference—should be removed. Place the pots in an ordinary frame on a cinder bottom or on a very gentle hotbed, afford water, syringe them daily, and keep fairly close till roots form. They need shade in sunny weather.

Dahlia cuttings.—Small side shoots cut off close to the main stems and inserted singly in 3½-inch pots at this date, and put into a close frame, make excellent if small tubers for planting-out next year. They should be allowed to grow-on as long as they will without drying them off, and be kept in the cutting pots till the spring. For general purposes I find this method of raising plants a good one, and they give earlier flowers than spring-struck cuttings; and, what is worth a great deal, they give much less trouble.

THE APIARY.

By EXPERT.

ALL filled sections should be taken away and fresh ones substituted, and sections which are not properly filled left for a little longer time. If preferred, where crates are nearly filled, an empty crate of sections may be placed underneath those which are filled; and to do this successfully and without killing any bees, raise the full crate and smartly draw a carbolio cloth underneath it to drive the bees down, and place on the empty crate as soon as possible. A little smoke should be given them before commencing this operation. As soon as the crate is finished, remove it by smoking the bees out, or by the use of a Porter bee-escape, which can be placed between the two sections. A new bee-escape has just come into use which should prove a great advantage over the old one, which has only one escape, which often gets blocked with dead bees; the new one has several escapes, which must certainly act a great deal better. Keep all sections in taking out of crate the same way up as the bees have left them, so as to prevent honey in the uncapped cells from running out, and then put them away in a place of safety. All swarms should be returned to the parent-stock if an increase of stock be not desired. If the bees swarm from the sections it means that the work of honey-gathering is stopped for a time, and as the weather is so unfavourable and time brief, they will have small chance of finishing the sections. Swarms should be fed if the rains continue. As a rule swarming bees generally take enough food with them to last three days, it will therefore be wise to feed them on the second day, discontinuing to do so if the weather should improve. The hives should all be numbered; and supposing that No. 1 swarms, and the swarms be placed in another hive—say No. 2—this fact should be recorded, so that you may know at a glance that No. 1, having swarmed, has a new queen, and No. 2, being a new colony from No. 1, has an old queen; by doing this you can easily tell which are your old stocks with new queens, &c. Keep down all long grass about the hives, and place alighting boards where they are needed. Have plenty of water about, so that the bees may drink, small floats being placed in the pans to save them from drowning. A little salt kept in a tin near the apiary is also an advantage. Wrap up swarms well, as they have no full combs of honey to keep them warm.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUG. 18	{ Royal Horticultural Society's Committee Meetings, Lecture on "Hollyhocks."
WEDNESDAY, AUG. 19	{ Shropshire Horticultural Society's Exhibition at Shrewsbury (2 days). Eastbourne Summer Show.
THURSDAY, AUG. 20	{ Royal Agricultural and Horticultural Society of Jersey, Exhibition (2 days).
FRIDAY, AUG. 21	{ Devon and Exeter Horticultural Society's Show. Strathearn Horticultural Show (2 days).

SALES FOR THE WEEK.

MONDAY, AUGUST 17—	Trade Sale of over 4,000 lots of Dutch Bulbs, by Protheroe & Morris, at 67 and 68, Cheapside, E.C., at 10 o'clock—Consignment of L. Harrisii, Freesias, Roman Hyacinths, &c., by Protheroe & Morris, at 67 and 68, Cheapside, at 5 o'clock.
THURSDAY, AUGUST 20—	Trade Sale of 3,000 lots of Dutch Bulbs, by Protheroe & Morris, at 67 and 68, Cheapside, E.C., at 10 o'clock.
FRIDAY, AUGUST 21—	Orchids in variety, at 67 and 68, Cheapside, by Protheroe & Morris, at 12.30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—62° 6'.

ACTUAL TEMPERATURES:—

LONDON.—August 12 (6 P.M.): Max. 71°; Min. 55°.

August 13 (Noon): Fine; 66°.

PROVINCES.—August 12 (6 P.M.): Max. 63°, Southampton; Min. 55°, Aberdeen

A New Garden for the Royal Horticultural Society.

WHEN a short time since a cardinal of the Romish Church announced to the expectant populace the election of a new Pontiff, the "great joy" experienced was not altogether unexpected. The tidings we have to convey to our readers will fill them not only with gratitude but also with surprise. Horticulturists in general, and the Fellows of the Royal Horticultural Society in particular, will rejoice that in Sir THOMAS HANBURY they have found a munificent and discriminative friend. He has presented to the Society the garden at Wisley, near Weybridge, so well known to a large circle of our readers as the creation of our late friend, Mr. GEORGE WILSON. The news is almost staggering. The generosity of the donor, the peculiar appropriateness of the gift, the opportune season at which it has been made will inspire all well-wishers of the Royal Horticultural Society with a feeling of gratitude and encouragement.

Sir THOMAS HANBURY is the owner of one of the most famous gardens in the world, that at La Mortola, near Ventimiglia, in the Italian Riviera, a few miles distant from the French frontier near Mentone. He has seen that garden—some illustrations from which were, as it happens, given in our last number—spring up under his own eyes. He knows by long experience what are the requirements of such an establishment. He knows that useful for ornament or for study as may be a plant in a pot on a greenhouse shelf, it is far more satisfactory in all ways when circumstances permit us to grow it under more natural conditions. At La Mortola a Mediterranean climate allows of the culture, in the open-air, under the least conventional conditions possible, of a vast variety of plants which in our duller, less genial climate would not thrive unless under protection. But for all that, we can grow in the open a vast variety of subjects of

beauty and interest, and among them some which would suffer in the drier, hotter climate of the Riviera. Recognising these facts, Sir THOMAS has, as we have said, made over to the Royal Horticultural Society the extremely interesting garden lately belonging to the late Mr. GEORGE WILSON, and of which we supply an illustration at fig. 49, p. 123. This is not a garden in the conventional sense, but a place in which plants thrive under the conditions most suitable to them. They are not arranged formally or for colour-effects, as in the dressed garden; they are not grouped according to their affinities, as they would be in a purely botanical establishment, nor are they disposed in groups to show their physiological peculiarities or their modes of life, as is the practice now in gardens intended specially for the use of students; but they are allowed to take possession of those nooks and corners wherein they can grow and display themselves to the best advantage.

SIR THOMAS HANBURY, K.C.V.O.

In such situations their beauty is displayed to the full; they are in harmony with their surroundings; their natural course of evolution is not thwarted but fostered. Of course this is only one phase of gardening—a very delightful one, it is true; but the formal garden, the lawns, the fruit-garden, the kitchen-garden, the arboretum, the trial-grounds, have all to be considered, and their claims in some cases are, of course, paramount. Fortunately at Wisley there is room for all these departments. There are nineteen acres of garden-ground and water, of the general character that we have mentioned; eighteen acres at present utilised as grass-land, and about twenty-two acres of arable land, and two residences on the property. What potentialities does not Sir THOMAS HANBURY'S gift open out!

As for the timeliness of the donation, it will be remembered that a very strong feeling exists among the authorities that Chiswick must be given up, and another garden formed under more favourable conditions. In spite of the historic associations and the powerful sentiments connected with

them, we have had no doubt that this would be a correct line to take in the future, although we have always urged that, as the lease of Chiswick has still several years to run, the duty of the moment is to attend to those matters which are of more immediately pressing importance—to secure a home for the library, adequate offices and meeting-rooms, which are sorely needed, and to make the best of Chiswick till these requirements are satisfied. Sir THOMAS HANBURY'S munificence alters the conditions very materially. The garden at Wisley is made. It can easily be adapted to the requirements of the Society. The additional features that will be necessitated can be added gradually, a small laboratory can be built, the scientific side of the garden can be developed as well as the practical, and the glories of Chiswick—now and for many years past historical rather than actual—can be revived, to the great benefit of progressive horticulture. Chiswick will leave imperishable memories, but there are not many now who will, unless as a matter of sentiment, regret its abandonment.

Wisley is charmingly situated, quiet and out of the smoke of London. Even at Kew the trees suffer from the smoke and fog, so that in the future a new arboretum must be secured. Where better than at Wisley? Wisley is reached from Weybridge by road, and there is a prospect that it will eventually be made more easily accessible by means of an electric tram along the Portsmouth road.

With hope and gratitude therefore we look forward to the future, and we feel, as a consequence of this grand gift of Sir THOMAS HANBURY, the imperative necessity of proceeding as rapidly as possible with the new library and offices. To this end the liberality of Baron SCHROEDER, Mr. ELWES, Mr. SUTTON, Mr. SHERWOOD, and others, still needs to be supplemented by the contributions of the Fellows of the Society, while scarcely less urgent is the necessity for securing a fund for the carrying out the necessary additions at Wisley, and an endowment for its future maintenance.

Foreign Flower Market.

THOSE who have occasion to pass through Tavistock Street, Covent Garden, will have noticed

the steady growth of a large building on the site where houses used to stand. The new building is only one more illustration of the vast increase of the flower and fruit trade done in the market. First, the Floral Hall, originally designed for concerts and similar purposes, was annexed, and is now used as an auction sale-room for foreign fruits. Then the old Hummums Hotel, the Bedford Hotel, and a large slice of Russell Street were requisitioned for market purposes. Then—we are not sure as to the exact sequence of events—the Flower Market was built adjoining our offices. Of this we gave illustrations in our volumes for 1872, p. 177, and July 7, 1894, p. 17.

In this building was held some years ago a unique evening meeting for the benefit of the Gardeners' Orphan Fund. The salesmen and dealers arranged the market with their beautiful productions, and put themselves to no little inconvenience in the hope that visitors to so novel and attractive a "soirée" would give practical evidence of their sympathy with the orphans and of their appreciation of the remarkable sight displayed before them by the self-sacrifice and willing

labours of the exhibitors. Sad to say, the financial results were so inadequate that nothing of the kind has been attempted since. In any case, a visit to the Flower Market in the very early morning is always an interesting and a beautiful spectacle, and one that has special attractions for the statistician and the economist, as showing the vast increase within a few years of the trade not only of fruit, but of flowers.

We have been speaking of home-grown flowers grown in the very numerous establishments in the suburbs of London, as well as at greater distances. But the foreign flower trade has also grown enormously.

A temporary structure was erected to accommodate this department of the trade, but that was soon seen to be totally inadequate. To supply the existing requirements the building of which we now give an illustration, thanks to the courtesy of A. R. O. STUTFIELD, Esq., the steward to the Bedford estate, has been designed.

The length of the structure is 126 feet, the breadth 96 feet. The total area 11,520 feet super; the floor-space 8,444 feet super.

The basement will be used for stores, as in the case of the foreign fruit-market (the old Floral Hall). The ground-floor space will be utilised by wagons, for convenience's sake, and also to relieve the congestion in the neighbouring streets.

The market for foreign flowers will be on the first-floor. Here there will be eight rows of counters and tables for the display of the produce, removed by a lift from the vans on the ground-floor. Provision is also made for numerous offices for the firms doing business in foreign flowers.

The façade shown in our illustration is that on the north side, facing the market. The construction is of red brick with stone facings, with iron pillars and girders, and ample provision for light. The architects are MESSRS. LANDER, BERDELL & CROMPTON.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Floral and Fruit Committees of the Royal Horticultural Society will be held on Tuesday, August 18, in the Drill Hall, Buckingham Gate, Westminster, from 1 to 5 p.m. A lecture on "Hollyhocks" will be given by Mr. WEBB at 3 o'clock.

At a General Meeting of the Society held on Tuesday, August 4, twenty-five new Fellows were elected, among them being Sir JOSSLYN GORE-BOOTH, Bart., Colonel the Hon. G. NAPIER, Major-General H. H. LEE, and Major BERNARD J. PETRE; making a total of 1,070 elected since the beginning of the present year.

DAHLIA SHOW, SEPTEMBER 1 AND 2.—The Royal Horticultural Society will hold a special exhibition of Dahlias on September 1 and 2, in conjunction with the National Dahlia Society, in the Drill Hall, Buckingham Gate, Westminster. At this meeting only Dahlias can be shown, with the exception of flowers, fruits, &c., for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 6 p.m. on the second day, but other plants may be removed as usual. For schedule of prizes, see Royal Horticultural Society's *Book of Arrangements* for 1903, pp. 89 to 93; or separate schedules can be obtained on application to Mr. P. W. TULLOCK, Sterndale, New Church Road, Hove, Sussex, Secretary to the National Dahlia Society. A lecture on "Judging Cactus Dahlias" will be given on September 1, by Mr. C. G. WYATT, at 3 o'clock.

THE FLORAL COMMITTEE.—On the 4th inst. I placed before the Floral Committee, on behalf of the raiser in Scotland, one of the most beautiful varieties of Lady Fern known to me, a quite distinct form from any others, and one of the gems of that sportive species. There was no question of its being merely a botanical curiosity, as it was perfect in its symmetry, yielded equally good forms from its spores, and, in short, by all who know anything about British Ferns, it is recognised as a charming thing. I naturally proposed an Award of Merit for it, which was seconded; and yet of fifteen members present seven refrained from voting at all; five voted for, and three against, so that under the new and salutary rule of a two-thirds' majority, the plant failed to obtain an award. This is not the first time I have been similarly surprised. Some time back I sent in another Lady Fern, found by myself in Ireland and recognised by competent judges as the best of all wild finds of cristate form. It is distinguished by very long, pendulous tassels, divided and redivided to the utmost; its habit is robust and erect, and there is absolutely no other variety which equals it on its own lines or resembles it at all closely. That too failed to obtain recognition; and all I could gather as to the causes of its disqualification was that "there were so many like it" (a proof of absolute ignorance). I have not been studying British Ferns for a quarter of a century without knowing something about them, nor am I by any means one of those who think that my own geese are necessarily swans, nor in either case did I depend entirely on my own judgment. I had the opinions of others before exhibiting, hence I am forced to the conclusion that the disqualification in both cases was simply and solely their British origin. A remark was indeed made in the more recent case that the plant was not a "market one." If this be the reason it is a ridiculous one, since, given recognition, there is no reason why it should not be propagated for the market. Moreover, the Floral Committee is not, or should not be, a mere trade committee to determine what is marketable, but should recognise merit whether marketable or not. Does the Orchid Committee act on such lines when an unique hybrid worth hundreds of guineas is put before it? I fancy not. So far as the non-voters are concerned, I can quite understand a man's refraining from voting when he knows nothing of the plant's family, and elects not to back another man's opinion, but what puzzles me is that men in the same position vote against those who are recognised as possessing the requisite knowledge, and thus nullify it. The net result is that British Ferns are relegated to the background, while exotics of no greater and often of less merit find ready recognition, exemplifying the old adage that a prophet has no honour in his own country. This should not be, and although I am on the Committee myself, I have no hesitation in openly signing myself as a protesting member on behalf of the British Fern cult. *Chas. T. Druery, F.L.S., V.M.H.*

GIFT TO WARRINGTON.—Through the generosity of Mrs. JOHN CROSFIELD the town of Warrington, in addition to the beautiful park presented by the late Mr. CROSFIELD, is now further enriched by the addition of a handsome conservatory, and still more valuable, the magnificent pyramid Camellias (which, under the able direction of Mr. W. KIPPS, were the adornment of Walton Lea, and perhaps amongst the finest cultural examples in the kingdom) have also been planted in the conservatory. At the opening, presided over by the Mayor (Mr. J. C. PARR), Mrs. CROSFIELD spoke of the interest the late Mr. CROSFIELD took in the Camellias, which, she was glad to say, had, with two exceptions, been removed safely to their new home by the head

gardener of the park (Mr. PARKER). She hoped to see Warrington with its winter gardens, and in concluding expressed the hope that her gift might be of use to the poorer townspeople. The Mayor at the conclusion presented Mrs. CROSFIELD with a handsome silver Rose-bowl.

PLANT PROTECTION IN AUGUST.—Set traps for caterpillars destructive of the fruit of the Apple, and destroy injurious insects, as in the previous month. When the Hops are gathered burn the remains of the Hop plants, so as to destroy the red spider, which is sure to be present in myriads on the foliage. Orchards under corn crops should have the stubble ploughed under as soon as possible after the harvest, a most important measure from the standpoint of protection from the numerous parasitic enemies of cultivated plants, which are thereby destroyed. Plants affected by mildew should be constantly well dressed with flowers-of-sulphur when the foliage is wet with dew or rain. As a protection against the Phytophthora disease of the Potato, sprinkle the haulm with the Bordeaux-mixture. Plants of Cabbage, Kohl-rabi and Brassicas generally affected with slime and other fungus should be pulled up and burned forthwith. Fusicladium of Pears and Apples may be destroyed by occasional dressings of Bordeaux-mixture, which is formed by decomposing copper sulphate with lime, in the following proportions:—Copper sulphate (blue stone, blue copper, &c.), 98 per cent., 2 lbs.; freshly-burned lime, 1 lb.; water to make 10 gals. Dissolve the sulphate in one half of the water. The lime after being slaked to a fine powder is well mixed with the rest of the water, and then poured into the copper solution and stirred. The vessel in which the mixture is made should be of wood or earthenware, not of metal. To test this allow the copper precipitate to settle, and dip blue litmus-paper into the supernatant liquid. If it remains blue the liquid is safe to use; if it turns red a small quantity more lime must be added, the liquid stirred, and the test repeated until the litmus-paper remains blue when dipped.

MEETING OF THE GERMAN DENDROLOGICAL SOCIETY AT BRESLAU.—We understand that the meeting of the German Dendrological Society was held in Breslau on the 6th and two following days in August. The programme seemed to promise an interesting exhibition, and excursions in connection therewith. The following papers were to be read:—By Dr. F. PAX (of Breslau) on Aceraceæ; Professor KOEHN (Friedenau) on the Genus *Amelanchier*; Herr Garteninspektor BEISSNER (Poppelsdorf), Coniferæ; Herr Gartenbaudirektor F. GOESCHKE (Proskau), Experiments in Acclimatising Silesian Plants; Herr Garteninspektor PURPUS (Darmstadt), Dendrological Researches; Herr GRAF VON SCHWERIN (Wendisch Wilmersdorf), the Genus *Sambucus*; Professor SCHUBE (Breslau), Sketches of Forestry in Silesia; and Herr Forstgarteninspektor BÜTTNER (Tharandt), Difficulties in Growing young Imported Conifers.

MELOCOTON.—Under this name we have received a kind of Squash, Pumpkin, or Marrow, which is reported by Mr. E. J. CAMPBELL, of the British Honduras Botanic Station, as coming from Mexico. It is a trailing Cucurbit which gives long, smooth, green fruits a foot in length and 4 to 5 inches in diameter. It is very prolific and makes an excellent substitute for the well-known Vegetable-marrow, which it much resembles when prepared for the table in its immature state. When ripe the fruits turn to a dark reddish-brown tint. It is considered an acquisition to our list of table vegetables. Mr. CAMPBELL describes the fruit as a "rare Mexican Melon of

handsome appearance and good flavour," and says, "It is eaten stewed with sugar, and fresh." *Trinidad Bulletin of Miscellaneous Information*, July, 1903.

"HOLIDAYS IN EASTERN COUNTIES," edited by PERCY LINDLEY. (London: 30, Fleet Street, E.C.)—Veiled, and handsomely veiled, by chatty information and by many attractive pictures, we have here a description of the country intersected by the Great Eastern Railway. As the sketch-map shows, this tract includes districts of great interest, and is in connection with the Continent via the Hook of Holland. Town, country, and sea-side are all available to the intending traveller by this route, and he is told concerning the attractions offered by the several towns, where golf-links and other chances of amusement are to be found. The holiday-maker still uncertain of his destination should consider the attractions here held out to him before finally making up his mind to go elsewhere.

CARNATIONS OF TWO COLOURS ON ONE STEM.—Mr. HOGAN, of The Gardens, Wroxton Abbey, Banbury, sends us a stalk of a Carnation which divides into two branches. One branch bears a flower with rosy-carmine petals, whilst the other branch bears two pure white flowers. We have seen such cases before in Roses, Pansies, Chrysanthemums, and other flowers, some of which have been figured in our columns. It is hard to say why this happens. If we call it a reversion to an ancestral condition, we do not explain it.

THE ENGLISH FLOWER-POT.—The talents of English manufacturers have not been exerted in the improvement of this necessary article in the garden, for the character and class of pot remain the same as they were fifty or a hundred years ago. The result is a loss to English trade. A buyer of considerable quantities in one of our Colonies assures us that he has long ago given up the importation of English makes, as the loss in transit, owing to the form of pot adopted, is, he assures us, as much as 60 per cent., while the loss when importing improved American forms is only some 3 or 4 per cent., and the price paid is the same. In the old form, no matter how carefully packed, one pot acts as a wedge inside another, and when a dozen or more are stood on end, the bottom pots are burst by the weight of those above them. In the American form this is obviated by the rim being made wider, the lower edge resting upon the rim of its neighbour. No English pots are therefore imported, and the English maker will shortly have no export trade at all unless he is sensible enough to alter his pattern, which does not cost any more to make than the pots of our grandfathers. [On the Continent pots are made on the American plan above described. ED.]

STOCK-TAKING: JULY.—The Trade and Navigation Returns for the month of July, just issued, present no very unusual features of interest. There is an increase in the recorded value of imports, and a small decrease in the figures representing the value of exports; and here it is worthy of notice that the values relating to both sides of the national account are too often arbitrary—not official, and we are assured that the total value of exports is compiled from nothing more reliable than the estimated prices placed upon goods by shippers; the Customs authorities merely record the stated values for statistical purposes. This is practically the case with untaxed imports. The value of these has to be excluded at the time of entry, but the Customs officials' only responsibility for these returns is simply the correct transcription of the figures passed to them over the counter. To proceed, the value of last month's imports is £45,653,320, against £44,086,960, showing an increase of £1,566,360. Among the items of increase are to

be found grain and flour; other food increments foot up at £921,266. The following figures are of value here:—

IMPORTS.	1902.	1903.	Difference.
	£	£	£
Articles of food and drink—duty free	9,829,968	10,268,913	+438,945
Articles of food & drink—dutiable	8,587,727	11,131,149	+2,543,422
All other Imports...	25,689,265	24,253,258	-1,416,007

The following figures will be of greater value this month and those to follow, owing to the practical failure of our own fruit crops:—

IMPORTS.	1902.	1903.	Difference
	Cwt.	Cwt.	Cwt.
Fruits, raw—			
Apples	35,786	80,147	+44,361
Apricots and Peaches	8,461	5,810	-2,651
Bananas ... bunches	259,583	270,107	+10,521
Cherries	83,274	46,684	-36,590
Currants	58,991	57,311	-1,679
Gooseberries	13,089	18,130	+5,041
Grapes	12,250	18,855	+6,605
Lemons	149,886	113,571	-36,315
Nuts—Almonds ...	3,695	5,027	+1,332
Others used as fruit	71,360	59,224	-12,136
Oranges... ..	128,268	59,648	-68,620
Pears	5,867	12,323	+6,456
Plums	35,656	30,638	-5,018
Strawberries ...	15,549	5,001	-10,548
Unenumerated ...	83,172	152,673	+69,501
Vegetables, raw—			
Onionsbush.	615,319	531,190	-84,129
Potatoescwt.	1,169,294	1,047,235	-122,059
Tomatoes... ..	164,182	227,361	+63,179
Vegetables, raw, unenumerated ...value	£37,011	£33,564	-£3,447

To those hungering and thirsting after fruit, it will doubtless be interesting to learn that this year's Orange and Lemon crop in California is estimated at 35,000 car-loads. During past weeks there have been large consignments of soft fruit such as Gooseberries, from German growers, through Dutch ports. Glasgow has been selling largely on Irish account in this commodity. A new Orange is making some stir in Natal (the Victoria), the result of cross-fertilisation under the hands of Mr. DAVID BROWN, and first introduced to notice by Mr. J. L. KNIGHT, of Verulam. Mr. BROWN is a well known-experimenter in cross-fertilisation. The result is a fruit girthing up to 15 and in some cases 16 inches in diameter. It is grafted on the Lemon, a very strong and vigorous tree; it is a heavy cropper, stands drought well, and is in full bearing four years after grafting. The fruit keeps well in the house for seven or eight weeks, endures rough usage, is good for shipping, and it is asserted that the fruit stands well on trees for three months after being dead-ripe. Lastly, much of the product is seedless. There! It is worthy of note here that timber and wood imports foot up at some £3,619,586, against £4,077,108 for July, 1902—a decrease of £457,495. The value of the imports for the past seven months is £306,086,900, against £306,790,912—a decrease of £704,012. We come now to—

EXPORTS,

which, for the past month, are valued at £25,875,545. Comparing these figures for those of July last year—£26,029,170—we have a decrease of £153,625. There is some decrease in the export of mineral waters, and of beer and ale; possibly the decrease in the exports of fish, cured and otherwise prepared, also in the number of barrels of herrings, may be held accountable for the "sympathetic" reduction. The value of the exports for the past seven months is £168,398,170, as compared with £161,404,744 for the same period last year, showing an increase of £6,993,426.

THE DÜSSELDORF HORTICULTURAL EXHIBITION.—The complete programme of the Horticultural section of the International Art Exhibition to be held at Düsseldorf in 1904 is now to hand, and gives particulars, not only of the main show, which is to be open from May 1 to October 25, but of various minor exhibitions that are to take place in connection with it. The general exhibition is to be held partly in the open-air, partly in the exhibition buildings. It is to comprise classes for foliage plants, Roses of all habits, Conifers and evergreens (in tubs, pots, or planted out), marsh and peat plants (Rhododendrons, Azaleas, Kalmias, &c.), fruit-trees (either standard or trained in various ways and growing in pots), as well as berry fruit of all kinds; early spring flowers, outdoor Ferns, alpine plants, decorative foliage plants (Palms, Agaves, &c.), and bog and hot-house plants, besides horticultural sundries such as summer-houses, bridges, seats, and general garden furniture. Within the buildings will be housed the exhibits, which will include decorative plants in pots, garden plans and models; the Scientific and Colonial section, industrial and trade products, machinery, tools, implements, and the like. The minor exhibitions are to take place very frequently during the summer. From May 1 to May 9 will be held inside the buildings a show of decorative groups of foliage and of other plants and Ferns, Orchids in bloom, flowering shrubs, bulbs, spring flowers, such as Pelargoniums, Cinerarias, Cyclamens, Carnations, fruit-trees, water-plants, and forced vegetables. Besides this, special exhibitions will be held indoors from May 14 to August 30. These will include blooming and foliage plants, cut flowers, florists' arrangements, fruits and vegetables. From September 3 to 11, the show will include decorative groups of flowering and foliage plants, Orchids, plants of commerce, cut flowers of every kind, ornamental fruits, and florists' specialities. An important exhibition of fruit and vegetables will be held from September 17 to 26, in which will be included Nuts, Grapes, and pot-plants. Chrysanthemums will be shown from October 18 to 23, and special exhibitions of Orchids will be held from October 1 to 17, and from October 21 to 23. These frequent shows throughout the summer have been so arranged by the authorities as to give every horticulturist the opportunity of exhibiting plants of which he makes a speciality, or in which he feels so great an interest that he wishes them to become as widely known as possible. Further particulars, forms of entry, and regulations respecting prizes and certificates can be had on application to the Director of the Art and Horticultural Exhibition of 1904 (Der Vorstand der Kunst und Gartenbau-Ausstellung, 1904), Düsseldorf.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The monthly committee meeting of this Society was held at the Caledonian Hotel, Adelphi Terrace, Strand, W.C., on Monday evening, Aug. 10. Mr. THOMAS WINTER presided. Seven new members were elected, and one other nominated. Four members are receiving sick pay, and eight are on the benevolent fund at the present time. Three other members have been relieved from this fund this year.

THE ROYAL BOTANIC SOCIETY OF LONDON.—The anniversary meeting of the Royal Botanic Society took place Monday, August 10, at the Gardens, Regent's Park. Mr. C. BRINSLEY MARLAY, D.L., who presided, congratulated the Fellows on the improved financial position of the Society. The Practical Gardening School was progressing satisfactory, while the Laboratory for Practical Work in Botany and Horticultural Chemistry was serving its purpose admirably. The introduction of electric-light and the work of developing scientific instruction would entail

considerable cost. He therefore hoped that the Fellows would introduce new members and thus enable the Society to carry on its work.

PUBLICATIONS RECEIVED.—*Bulletin of the Department of Agriculture, Jamaica*, June and July, 1903. Contents: Cocoa, II., Shade for Coffee and Cocoa, Jamaica Cassava, Four recently-described Ferns from Jamaica, &c.—*Botanical Department, Trinidad, Bulletin of Miscellaneous Information*, July. Contents: A Newly introduced Cucurbit, Plants indicating Character of Soils, &c., March 31, 1903. Details advance in all Stations, and special attention to Sugar, Rubber, and Cotton Plantations.—*Fifteenth Annual Report of the Agricultural Experiment Stations of the Louisiana State University and A. and M. College*, for 1902. A record of industry at all Stations, especially in connection with sugar-cane Plantations.—*Report on the Botanical and Afforestation Department Hong-Kong for 1902*. The work has been steady and satisfactory, except as regards the herbarium and library, where very little progress has been made. Various additions were made to the Hong-Kong flora during the year.—*Journal of Agriculture of Victoria*, May. Contains reports on: Crops under Irrigation, Australian Saltbushes in California, Hop Growing in Victoria, St. John's Wort as an injurious weed, &c.—*Proceedings of the Agricultural and Horticultural Society of India*.—*Proceedings of the Agri-Horticultural Society of Madras*.—*Report of the Botanic Gardens, British Guiana, 1902-1903*.

HOME CORRESPONDENCE.

CEREUS GRANDIFLORUS.—"The Queen of Night" has flowered splendidly lately at the grand estate of Baron Rozenirn-Lehn, at Orebygaard, in the Island of Lolland, Denmark. The fine flower-gardens and plant-houses are under the direction of the head-gardener, Candidate J. W. Jørgensen, and among his specimen plants may be mentioned some *Cereus grandiflorus* in extraordinarily good condition. There are nine plants, planted six years ago, and some of them were photographed by an amateur photographer, Ingénieur Mengel, at Oreby. The nine plants are planted against a stove wall, and have this year, as last year as well, borne more than 200 flowers. The number of blooms open at the same time in one evening has been the last five years respectively sixteen, twenty-four, twenty-seven, thirty-two, and now forty-two! It was a splendid sight, with which hardly anything can be compared in our northern country. *Carl Hansen, Professor, 28, Hollandervei, Copenhagen, V.* [To Messrs. Cannell & Sons we are indebted for what had been a magnificent flower of *C. triangularis*. Ed.]

RIBES SPECIOSUM.—In the issue of the *Gardeners' Chronicle* for August 1 occurs a short account of this striking and graceful flowering shrub, showing that it is a hardier plant than is usually supposed. We have an old specimen here which confirms this; it is growing as a bush, facing the north, and receives very little direct sunshine indeed, though it is fairly well sheltered by the house, being situated a yard or so from the wall. It flowered profusely this summer, and was an object of considerable admiration. Perhaps it has a liking for shade and moisture, for such are the conditions under which it flourishes here. Our specimen is many years old, and shows no sign of lessened vigour. There is also a smaller one, an offshoot from the old plant, growing quite well in a fairly open easterly aspect. *Ribes speciosum* is quite a desirable flowering shrub to have, for besides its beauty when covered with its Fuchsia-like blooms, it is one of the earliest plants to come into leaf; yet one rarely sees it. *J. P. Blaitwaite, Carlisle.*

OAK FUNGUS.—A short time ago, Mr. John Enys showed me several Oak-twigs that he had picked up beneath his trees at Enys, Cornwall. On first seeing numbers of these twigs lying under the trees, he attributed their presence to squirrels, but on examining them, found no trace of the bark being bitten. At the point of separation from the larger branch the twigs were much swollen, and the extremity appeared cicatrised. Mr. Enys forwarded some twigs to Kew, and was informed that the falling of these was due to the parasitic Oak-fungus, *Dichæna quercina*, which was very common on Oak-bark, but that it had not been previously recorded as a girdling parasite. Mr. Enys asked me to notice, whether Oaks in other districts were similarly affected; and a short time later, being in Monmouthshire, I found the Oaks on the Wylands estate, about two miles

from Chepstow, with numbers of twigs in the same state as those at Enys lying beneath them, and at Lydney Park, about twelve miles distant, and also at Raglan Castle the same thing was observable. On my return to South Devon I found that the Oak trees were also attacked in the same manner by the fungus, and picked up many twigs beneath them. I forward a few from Cornwall, Devon, and Monmouthshire for your inspection. Those I have found range in girth from the size of a finger to that of a knitting-needle. Some were terminated by fresh green leaves, and some short pieces, not more than an inch in length, had cicatrices at both ends. If, as stated by the Kew authorities, this fungus has not been previously known to attack Oak trees in the manner recorded, you might think the occurrence worthy of remark. *S. W. Fitzherbert.* [The fall of the branchlets of the Oak occurs often enough without any fungus by a natural process. Ed.]

"MAIDENHAIR."—Mr. Brotherston (p. 69) says: "According to Turner, Galium was called in the North, Maidenhair. This Britten identifies with Galium Aparine; but as 'petite Muguet' is given as an equivalent, it is plain that it is a mistake." Certainly, such an identification would be "a mistake"; but may I inquire where "Britten" made it? Certainly not in his edition of Turner's *Names of Herbes*, where "Maydeusheire" (Turner's spelling) is glossed Galium verum; nor in the *Dictionary of English Plant Names*, where it is also correctly identified. *James Britten.*

SHALLOTS V. EGYPTIAN ONIONS.—At several shows in Kent this season, notably at Chilham, large Russian Shallots have been disqualified, "not being Shallots" in the opinion of some of the judges. At Chilham, we are led to understand, five lots were disqualified, the judges there writing on the cards, "Disqualified, being Egyptian Onions." Representation has been made to us by several exhibitors that this conduct on the part of the judges is wrong. Undoubtedly it is; and it is poor encouragement to amateurs and cottagers who, after procuring the best exhibition Shallots and growing them, have their exhibits treated in this way by men who must be in complete ignorance of what large Russian Shallots are. *Dobbie & Co.*

STRAWBERRY THE LAXTON.—My experience with this Strawberry is quite the opposite to that of your correspondent Mr. Barclay. I know well that soil makes a difference in the behaviour of Strawberries, and I incline to the opinion that Mr. Barclay's garden is on a gravelly subsoil. At Norwood, on the London clay, the Laxton has been the Strawberry of the season, while Royal Sovereign for the first time has been quite a failure, the fruit (that is, what was left by the frost) damping off. The Laxton was simply splendid in every way, the fruit large, of good shape and colour. Having a good constitution, I am of opinion that it is the coming Strawberry, both for market and private gardens. The raisers in their catalogue do not recommend it for forcing. Trafalgar is also a very fine variety here, and Latest-of-All is simply indispensable. *J. Anderson, Streatham Grove, Norwood.*

SPECIFIC NAMES.—I think a further examination of the new Kew *Hand-Lists* will show Mr. C. Wolley-Dod that the authorities frequently use capitals in the orthography of specific names derived from patronymics. For instance, *Crinum Powellii*, *Crocus Boryi*, *Cyclamen Atkinsoni*, *Delphinium Menziesii*, *Geranium Rossii*, *Erigeron Roylei*, and countless others possess initial capitals. The fact that there are exceptions to this practice seems merely to suggest that there has been carelessness in compilation or in proof-reading. It would be difficult to make a uniform rule which would be logically defensible. Common-sense suggests the initial capital in names synonymous or in apposition, such as *Lythrum Salicaria*; and in the case of personal and geographical names there is distinct offence to the eye in *Crinum powelli*, while there is none—unreasonably, I am prepared to admit—in *Crocus nevadensis*. May we not therefore use a small initial for specific names which are descriptive-adjectival or local, and a capital initial for

synonyms and patronymical adjectives? This is the practice I have adopted in my recently-issued *Concise Handbook of Garden Flowers* (Methuen), and though it lacks symmetry it may be justifiable from a practical point of view in that it helps to the understanding of the specific name. *H. M. Batson, Hoe Benham, Newbury.*

THE ROYAL HORTICULTURAL SOCIETY'S COMMITTEES' CRICKET MATCH.—It is to be hoped that this proposed cricket match, the one held last year having been so pleasant and successful, is but put off for a few weeks. To postpone it indefinitely would be ungracious to the Earl of Ilchester, who so kindly offered the use of Holland Park for the match, and be not less annoying to his esteemed gardener, Mr. C. Dixon, who has done so much to perfect the arrangements and get the ground into good order. The initial mistake without doubt was made in fixing the date of the match so early as August 8, when so many members are engaged in other directions. Last year the match was on September 3, nearly a month later, when a delightful day was experienced and there was a good attendance. It is hoped that the first week in September will yet be selected, and thus show both Lord Ilchester and Mr. Dixon that their kindness is fully appreciated. *A. Dean.*

ODONTOGLOSSUM CRISPUM SIBYL.—In your notice of the above plant, shown in bloom at the Holland House show, you describe it as having been raised here. This is an error; and it should have been noted as a natural hybrid. *Norman C. Cookson, Oakwood, Wylam.*

"CONDOR" RABBERRY.—You are quite right in your supposition that "the unfavourable weather has hindered the development of sweetness" in this variety. In normal summer weather it is sweet and of good flavour, but a continuous downpour of rain day after day, with no sunshine and chilly nights, made all Raspberries in this district acid and flavourless. Fortunately the weather has now changed for the better. *George Pyne.*

THE CUCUMBER LEAF-SPOT.—One extensive cultivator of Cucumbers at Worthing informs me, and I have observed it also, that this malady is not so prevalent this season as last, it being mid-summer before it showed itself on the plants, and then its spread was not so rapid. This spot has more than once been termed the "Worthing spot," but during the present season I have seen more spot among the London suburban market establishments. This is of interest, and on asking Mr. Sparkes where the spot began in his houses, his reply was, "At the door-ends." Again, as evidence of the lessened virulence of the disease, I observed a Cucumber-house with plants in bearing, which had been affected some six weeks, and were yet yielding a paying crop. Another statement he made was that the spot began to appear generally after a severe thinning of the bine, and he thought that this showed a lack of strength and the need of more feeding. I give this for what it is worth. However, I must say the Worthing growers are far cleaner in their culture than many I have seen this season in my travels. The hillocks on which the plants grow are small in size, and less manure is employed. *Stephen Castle.*

PREPARING STRAWBERRIES FOR FORCING.—I can fully endorse Mr. Coomber's remarks with regard to taking runners from young plants set out the previous autumn. Two, three, or even four-year-old plants will give fine strong crowns, but side by side with plants from the younger stock near fruiting stage the difference is very marked. Contrary to the opinion of many good gardeners, I do not believe in using very rich composts for Strawberry plants; and on light loams I never report, but simply layer the runners into deep 32's. These pots I prefer to 48's as they are less liable to suffer in autumn from drying winds, slip-shod watering, &c., a matter which may mean success or failure. That fine old gardener and fruit cultivator, Mr. T. Blair, for over thirty years at Shrubland, was a very successful forcer of the Strawberry in 5-inch pots, and British Queen and Countess H. du Thury answer well in this sized pot. We grow from eight to ten thousand here for early and late

forcing, chiefly Royal Sovereign. This season I noticed a higher percentage of blind ones than usual, doubtless owing to the damp autumn and lack of sun in ripening the crowns. *G. T. Briggs.*

ROSE ZEPHYRINE DRUOT.—The late Mr. Selve Leonard, who took a great interest in this Rose, spelt it as above. He was largely instrumental in re-introducing into this country this exquisite thornless Rose, which blooms from June to November. Mr. Leonard used it in his garden designs, and largely as a pillar or natural bush in herbaceous borders. The Guildford Hardy Plant Nursery is still, I believe, the chief English source of supply, and I have pleasure in enclosing blooms cut from trees supplied by them to me four years ago. *A. C. Curtis, Glasenwood, Guildford.* [A Rose without a thorn, rich in colour, delicious in perfume. Ed.]

BOOK NOTICE.

STUDIES ON THE LIVID-ROT OF THE VINE (*Coniothyrium diplodiella*), by Dr. Gy. de Istvánfi. (Ann. Inst. Ampelogr. Roy. Hongrois, II., 1902.)

In this age of record-breaking, I think it may safely be said that the work under consideration constitutes a record in its way, no fewer than 288 pages of text, twenty-four coloured plates, and twelve figures in the text being devoted to the life-history of a minute fungus parasitic on the Vine. Furthermore the work is a masterpiece of research, as would naturally be expected from one who for some years assisted Brefeld in his researches on the fungi. From the practical standpoint there is ample justification on the part of the Hungarian Minister of Agriculture for facilitating the research and forwarding its publication, inasmuch as it is stated that in 1901 damage to the extent of £320,000 was experienced by the viticulturalists of Hungary, caused by this fungus alone.

The fungus is by no means a novelty, being first observed in Italy in 1878, and like many, perhaps most other plants of as long standing, has received several different names. Its most generally used trivial name in Europe and the United States is White-rot; however, Dr. Istvánfi elects to call it Livid-rot, because the blotches it produces on Grapes are livid and not white.

Every part of the Vine above ground is liable to attack from this pest. On the leaves large, irregular patches of a dingy-white or livid colour are formed, and as the diseased portion dies and becomes dry, its surface is studded with myriads of minute black points, which represent the fruit of the fungus. Its presence on the branches is first indicated by a brownish tint, which soon changes to grey, at which stage the numerous black points or spore-bearing bodies appear. The tendrils often become much distorted when attacked.

The fruit may be attacked at all stages, and very frequently infection takes place first at the pedicel or stalk, and from thence passes into the berry. When grapes are about half grown, the disease commences in a very characteristic manner, and is easily recognised. The first indication of disease is a pale-brown discoloration at the point where the berry is attached to its stalk. This discoloration extends evenly all round the fruit, its extreme edge being of a darker brown than the remainder, thus forming a dark ring round the berry. This dark line continues to move slowly from the stalk end until the entire berry becomes brown; at a later stage it changes to a livid colour, bears numerous fruit-pustules, and the berry shrivels and dries up.

Up to the present, Livid-rot has proved to be one of the most stubborn of parasitic fungi to combat, there being no known practical means of killing the spores. Dr. Istvánfi has discovered that this immunity of the spores is due to the presence of a certain amount of chitin in the

spore-membrane, which enables it to resist the action of fungicides.

Numerous tables are given, showing the action of nearly all known fungicides upon the spores, the outcome being that not one is of the slightest value; in fact, spores that had been soaked in Bordeaux-mixture for twenty-four hours afterwards germinated and produced fruit.

Next comes a table of results of experiments, in which it is announced that under the action of one fungicide the spores are all killed. An explanation follows, in which the author states that he has discovered a substance easy of application, always effective, innocuous, cheap, &c., capable of killing the spores of *Coniothyrium diplodiella*, notwithstanding their tenacity, and, as naturally would be expected, it is also stated that this same substance will also kill the spores of other species of parasitic fungi not fortunate enough to possess an armour-cased exterior containing chitin. Thus we are led up to believe that, so far as fungus parasites are concerned, the long-hoped-for millennium has at last arrived, and anxiously scan the following page for further information.

After much patient search an obscure footnote is discovered, which explains that the newly-discovered fungicide is now being patented in all important Vine-growing countries. In another place it is stated that further information of a practical nature will be given at some future time! *Geo. Massee.*

NEW HYBRID HEMEROCALLIS.

In my garden at the Vomero I cultivate all the *Hemerocallis* and *Funkias* which I have been able to obtain, including all those known in European gardens. They flower here from the end of April until November. *H. minor* and *Dumortieri* are the first to flower, and the fine *aurantiaca* blooms from April to November, being thus the first and also the last. I cultivate them all in the open ground and in full sun, giving much water and manure. When the plants first came here all were completely sterile, and I lost all hope of fertilising and hybridising them. But little by little some of them showed the lost quality of seed-bearing, and finally some new importations from Central China made it an absolute certainty that it would be possible not only to grow seeds but also to hybridise the plants, and now the result is very promising, and we have some fine hybrids.

Up to the present we have had seeds from the following species and varieties:—

Hemerocallis minor, Mill.
 " *Thunbergii*, hort. Lemoine.
 " *citrina*, Baroni.
 " *fulva maculata*, Baroni.
 " *aurantiaca major*, Baker (?)

The remainder are still sterile, but give pollen abundantly. We have hybrids of the following:—

H. citrina × *aurantiaca major*
 " × *fulva maculata*
 " × *Thunbergii*
 " × *minor*
 " × *disticha*
 " × " fl. pleno
H. aurantiaca major × *citrina*
 " × *fulva maculata*
H. Thunbergii × *citrina*
 " × *aurantiaca major*
 " × *minor crocea*
H. minor crocea × *Thunbergii*
 " × *citrina*.

If sown immediately after ripening the plants or seedlings flower here during the third year, and some of them after the fourth year. We water and manure them abundantly, for they are always thirsty and hungry. Here is a short but concise description of my first fine and interesting hybrids:—

1. *HEMEROCALLIS VOMERENSE* (*Thunbergii* × *minor crocea*).—Leaves about 2 feet long, and very narrow, deeply canalliculate, light green. Stem more than 2 feet long, with eight to ten very fine sweet-scented, canary-yellow flowers borne April-May. The outside

of the flowers is a little more darkly shaded. A fine hybrid, exactly midway between its parents. It is not sterile, but produces perfect seeds:—

2. *HEMEROCALLIS ELMENSE* (*minor* (*graminea*) × *citrina*).—Leaves about 2 feet long or longer, concave, light green, loose; very stoloniferous. Stem about 3 feet long, bearing ten to twelve or more flowers of a brilliant canary-yellow, very large, widely opened, sweet-scented; trunk bright green, tube very long, flowers April-May, and is useful as a cut flower.

3. *HEMEROCALLIS* × *HIPPEASTROIDES* (*Minor crocea* × *Thunbergii*).—Leaves about 2 feet long, narrow, elegantly recurved, light green; stem 2½ feet long, with about ten or more very handsome, widely opened flowers with star-like horizontal petals, brilliant sulphur-yellow, and sweet-scented. A magnificent variety that flowers in May and is exceedingly elegant.

4. *HEMEROCALLIS* × *PARTENOPE* (*Thunbergii* × *aurantiaca major*).—Leaves about 2 feet or longer, narrow, concave, fresh-green, a little shaded with grey outside; stem cylindrical, slender, with many leaves, and ten, sixteen, or more flowers. These are large, like a Lily, canary-yellow, sweet-scented, with undulate petals. A very fine hybrid, producing seed abundantly, and exactly midway between its parents.

5. *HEMEROCALLIS* × *BARONI* (*Thunbergii* × *citrina*).—This flowered first on June 20, 1903. Leaves about 2 feet or longer, concave below, undulate on the upper surface, like the leaves of *Citrina*, and pink on the lower part; umbel widely spreading, with many flowers, which open in the evening or about 4 o'clock, and are sweet-scented, very large, with the inner petals larger than the outer, and a very long, light-green tube. The stem is elegant, slender, and about 3 feet in height. A splendid hybrid, with canary-yellow flowers.

6. *HEMEROCALLIS* × *OCHEOLEUCA* (*Thunbergii* × *citrina*).—Flowered first on June 21, 1903. Leaves about 2 feet long, narrow, concave on the lower surface, undulate, fresh-green; stem more than 2 to 3 feet in height, slender, much ramified; flowers open at 6 o'clock in the evening, remaining so during the following day, sweet-scented, large, deeply sulphur-yellow, with gold anthers, and a short, greenish tube. A splendid hybrid, and one of the finest of all the *Hemerocallis*.

7. *HEMEROCALLIS* × *MULLERI* (*Thunbergii* × *citrina*). Flowered first on June 25, 1903. The very fine large flowers open at 4 o'clock. The leaves are like those of the pollen-parent (*H. citrina*, sent from Central China by the late Padre Givaldi, and named by Prof. Baroni, of Florence), are narrow, concave, and undulate; stem 2 feet long, always cylindrical, but somewhat angular, not much divided, but with about fifteen flowers or more in the umbel. The flowers are very large, with large petals, sweet-scented, canary-yellow, with a long, greenish-yellow tube and golden anthers. This is, so far, the finest of my new hybrids.

Charles Sprenger, Vomero, Naples.

Obituary.

MR. J. S. HEDDERLEY.—This well-known Midland florist died quite recently at his home at Sneinton, Notts, at an advanced age. A contemporary of the late Mr. E. S. Dodwell, he was one of a large band of florists who fifty years ago made Derby and Nottingham centres of Carnation culture. He was an enthusiastic Carnation cultivator, and was highly successful as an amateur exhibitor, contributing to the *Midland Florist* and to *Gossip of the Garden*. It was in 1855 that the scarlet bizarre Carnation Admiral Curzon sported in his garden to a scarlet flake, to which he gave the name of Sportsman; and it went at one bound to the head of its class, and in the year 1856 it took the whole of the prizes offered for the best scarlet flake at the National Carnation Society's annual exhibition at Birmingham; and in this year, 1903, nearly fifty years afterwards, Sportsman took the first prize as the best scarlet flake at the recent exhibition by the National Carnation Society at the Drill Hall; and at the Midland Carnation show at Birmingham on the 6th inst. it took the 1st, 2nd, 3rd, and 4th prizes among the scarlet flakes. Mr. Hedderley raised a charming rose self named *Royalty*, which I have reason to believe is the variety Mr. J. R. Upton shows so finely on long stems at the Drill Hall. One of the best Carnations the late Mr. E. S. Dodwell ever raised was C.B., J. S. Hedderley, which he named after his life-long friend; and it is still one of the most popular exhibition varieties. I think it may be said of Mr. Hedderley that he had outlived every one of his contemporaries of 1855. *R. D.*

NEW CHINESE PLANTS.

THE following new species of *Corydalis* are two very charming rockwork plants, which are among the many novelties discovered in China by Mr. Wilson when collecting for Messrs. J. Veitch & Sons, in whose nursery they are now in flower. Both have a lax rosette of bipinnately cut leaves, and several erect, handsome racemes of yellow flowers arising direct from the perennial root-stock. *C. tomentosa* is densely covered with soft white hairs on the leaves and racemes, and has light yellow flowers; whilst *C. Wilsoni* is glabrous,

side, the rest entire, rather thick in substance. Racemes erect from the rootstock, 5 to 7 in. high, leafless, many-flowered from about 1 in. above the base, tomentose on all parts except the corolla. Bracts 2 to 3½ lin. long, entire, lanceolate, acuminate to a fine point. Pedicels 2 to 3 lin. long. Sepals ¾ lin. long, ovate, acuminate, entire. Corolla (including the ¼ in. long spur) ¾ in. long, light canary-yellow, without markings; limb of upper petal spreading, ovate-oblong, subtruncate, obtusely apiculate, with recurved margins, concave at the middle and slightly gibbous-keeled

CORYDALIS WILSONI, N. E. Brown (*n. sp.*).

Glabrous in all parts. Leaves all in a lax radical rosette, 4 to 6 ins. long, 1½ to 2½ ins. broad, oblong, bipinnatisect or bipinnatifid, light glaucous-green; pinnae about five on each side, alternate, petiolulate, 7 to 13 lin. long, 3 to 9 lin. broad, ovate or deltoid-ovate, pinnately 3 to 5-lobed or with the lower lobes free, with a lobule on their outer side, rather fleshy in substance. Racemes erect from the root-stock, 5 to 7 ins. high, leafless, many-flowered from about 1 in. above the base. Bracts 4 to 5 lin. long,

FIG. 49.—VIEW IN THE GARDEN OF THE LATE MR. G. F. WILSON, AT WISLEY, SURREY. (SEE P. 118.)

(Lately presented to the Royal Horticultural Society by Sir Thomas Hanbury.)

with light glaucous-green foliage, but not covered with a glaucous meal, and the flowers are in rather denser racemes, larger, and of a deeper yellow than in *C. tomentosa*. Both are very attractive plants, and probably hardy.

CORYDALIS TOMENTOSA, N. E. Brown (*n. sp.*).

Leaves all in a lax radical rosette, 4 to 7 ins. long, 1½ to 2 ins. broad, oblong in outline, bipinnate, everywhere softly and densely white tomentose, very pale green, prettily tinted with reddish; pinnae 4 to 6 on each side, opposite or alternate, ½ to 1½ in. long, 5 to 6 lin. broad, petiolulate, oblong-ovate obtuse lobes, the upper united with the terminal lobe, the lower with a tooth on the outer

on the back; limb of lower petal slightly spreading, ovate, obtuse, minutely apiculate, with a boat-shaped central cavity, gibbous beneath and minutely scabrous on the front part of the gibbosity; spur compressed, 1½ to 1¾ lin. broad, falcate-oblong, decurved, very obtuse; inner petals obtuse, bluntly apiculate, with somewhat inflated keels. Stigma crutch-like, with horizontal arms. Capsule about 1 in. long, terete, pubescent. Allied to *C. tomentella*, Franch., but differs in the leaves being more spreading, tomentose with longer hairs, and the flower-stems all arising direct from the root-stock, not from a branching leaf-bearing stem as in *C. tomentella*, besides which there are differences in the structure of the flowers.

entire, lanceolate, acuminate to a fine point. Pedicels 3 to 4½ lin. long. Sepals 2 lin. long, ½ lin. broad, ovate-lanceolate, acuminate to a fine point. Corolla (including the ¼ in. long spur) 11 to 12 lin. long, deep canary-yellow, with greenish keels to the outer petals, the limbs of which are similar, spreading, ovate-oblong or elliptic-oblong, acute and reflexed at the tips, with a deep lanceolate central depression and more or less recurved margins, gibbous-keeled on the back; spur much compressed, 2½ in. broad, falcate-oblong, decurved, very obtuse; inner petals obtuse, somewhat acutely keeled. Stigma crutch-like, with incurved arms. Capsule about 1 in. long, terete, curved, glabrous. N. E. Brown.

A TEXT-BOOK OF BOTANY.*

THE book we have now to mention bears the names of Professors Strasburger, Noll, Schenck, and Schimper, as authors. This is the second English edition, revised from the fifth German version by Dr. W. H. Lang, of Glasgow. The Introduction is an excellent epitome of the present condition of botanical thought, though we think that, without in the least depreciating the labours of Darwin, some acknowledgment should also have been made of those of Wallace. The term "natural selection" is well understood by experts, but it is questionable whether "adaptation" is not the more expressive term and more readily understood by students. "Survival of the fittest" is another phrase that requires modification according to circumstances. An organism may not really be the fittest, but it is made so as the ultimate result of often conflicting circumstances, just as a plant may thrive in a given locality, not because it is really intrinsically the best suited to that locality, but because it there happens to be less exposed to competition from rivals. It grows where it can, not where it would prefer to grow, had it a choice in the matter.

To show how well the book has been brought up to date, we may note that Prof. Hugo de Vries' Mutation theory is invoked to account for the production of new species. Instead of the successive evolution of new variations, which gradually, when sufficiently attuned to circumstances, assume a permanent character, transmitted by inheritance, and thus become species, Prof. De Vries looks upon what a gardener would call "sports" as the starting-points of new species. It may be so, but we are by no means sure that in a work like the present it is not premature to adopt Prof. De Vries' conclusions as articles of faith without further confirmation.

Has any other botanist met with these varieties of *Eurothera Lamarckiana*, which the Dutch naturalist raises to the rank of species, or has their permanence been tested by others? We have seen large areas covered with the plant, and have looked for these sudden mutations without success. Of course that proves nothing but the desirability of further research.

Prof. De Vries, in his experiments with the contorted *Dipsacus*, succeeded in rendering permanent the twisted condition of the stem. Self-sown seedlings from seeds kindly sent us by Prof. De Vries have now come up year after year, but show not a trace of spiral torsion.

The accuracy of Prof. De Vries' own observations is, of course, beyond all question, but the different results obtained elsewhere suggest that the "Mutation theory" is hardly sufficiently established to be treated as a dogma, to be incorporated in a student's text-book, as it is in the Introduction to the work before us. Propagation by grafting would be rendered unnecessary if the reproduction of "sports" could be depended upon from seed.

On the book itself it were an impertinence to comment. It is clearly intended for advanced students, who have the resources of a botanical laboratory at their disposal. A novice would hardly know what a "catalytic enzyme" is. It is mentioned on p. 77, but, so far as we see, no explanation either of the adjective or of the substantive is given in the preceding pages. The relegation of the very numerous bibliographical references to the end of the volume no doubt saves space and repetition, but it does not add to the comfort or convenience of the reader. The book is richly illustrated, and some of the illustrations are even coloured.

* Macmillan & Co.

A copious index is added, in which, however, we do not find the term "diarch."

We give one more illustration showing the care that has been taken to bring the volume up to date, and that is afforded by the reference to Johannsen's experiments with ether in shortening the resting stage of plants. Gardeners on the continent have preceded us in turning this discovery to account in the forcing of Lilacs and other flowers.

As a book for advanced students there is no superior to this, as it deals with all departments of Botany.

SOCIETIES.

ROYAL HORTICULTURAL.
Scientific Committee.

AUGUST 4.—Present: Dr. M. T. Masters, F.R.S., in the chair; Messrs. Hooper, Saunders, and Bowles; Dr. M. C. Cooke, Revs. W. Wilks and G. Henslow, Hon. Sec.

Late flowering Plums, &c.—Mr. HOOPER had noticed that various modifications occurred in flowers of fruit-trees at the present time. Petaloid sepals and semi-doubling of petals with two carpels, forming twin Plums, were not uncommon. It was observed that in the common cultivated double Cherry [and in *Prunus triloba*] there are always two foliaceous carpels present. Pear-trees, &c., have also produced a second crop of flowers, which are borne on the ends of the young shoots instead of on spurs.

New Crocus.—Mr. BOWLES exhibited dried specimens and drawings of *C. caspius*, from Russian Talych, S.W. Caspian, with a white flower tinted with rose. He also showed the autumn-flowering *C. Scharojani* from the Caucasus. It is of an orange colour, and carries the leaves of the last season simultaneously.

Papaver pavoninum.—Mr. WILKS showed a plant from Central Asia (see *Garten Flora*, 1882, p. 296, t. 1695), remarkable for a crescent-shaped black band above the base of each petal.

Cucumber Diseased.—Mr. DAVIS, of Bitton, Bristol, sent roots of Cucumbers which had failed. Mr. SAUNDERS reports as follows upon them: "I found that the extreme base of the stems were attacked by small worms belonging to the family Enchytracidae, which are nearly related to the earthworms, and are well-known pests at the roots of plants; they were undoubtedly the cause of the unhealthiness of the plants. Lime-water will kill them in a few minutes if it can be made to reach them; thoroughly drenching the soil with this fluid might be of use, though I do not know what effect it might have on the plants. They, however, are so injured that I should imagine the best thing to do would be to pull them up and burn them, and burn or bury deeply the soil in which they grew."

Cucumbers Diseased.—Dr. COOKE reported upon some fruit badly attacked received from the neighbourhood of Bristol. It appears to be due to a fungus new to science, which he has named *Cladosporium scabies*. A full description will be recorded in the *Journal of the Royal Horticultural Society*. He strongly recommends "that all diseased fruits be removed and destroyed at once, and those remaining should be sprayed to preserve them from attack. Condy's Fluid, diluted, should be tried as less likely to injure the fruits than copper solutions. No effort should be spared at once to stamp out the pest."

ROYAL SCOTTISH ARBORICULTURAL.

THE twenty-sixth annual excursion of this Society was made this year to Bedfordshire, Buckinghamshire, and Hertfordshire, the estates of Woburn, Wreat, Ashridge, Tring, and Mentmore, and the woods in the vicinity of High Wycombe, being visited. About 100 members and friends of the Society took up their headquarters at Leighton Buzzard on July 27, and an early start was made the following day for Woburn.

The first stop was made at Brickhill, where the party was met by Messrs. C. P. Hall & Mitchell, respectively agent and forester on the Woburn estate. Here, young plantations, planted in 1901, 1902, 1903, on a light sandy soil, were inspected, various areas having been planted with pure Oak, pure Ash, pure Scots Fir, and mixed hard-woods and Conifers. All looked extremely well, but the policy of planting pure Oak and of putting Scots Fir on ground so well adapted for silt planting, came in for a little criticism. The system of pit planting is, however, undoubtedly the correct one,

although it is an open question whether the extra expense incurred is justified by results in the case of Scots Fir on ground of this description. Experiments in the cultivation of Heather were also seen, both planting and sowing being tried; but the latter so far has proved a failure.

A move was next made to the Scots Fir woods adjoining, in which the most interesting object-lesson of the day was seen. This was the natural regeneration of several acres of Scots Fir on ground from which the old crop had been removed about four years ago.

The young crop covered the ground evenly and thickly, and showed every sign of forming a useful crop. A number of self-sown Plymouth Pine [What is the Plymouth Pine? We are not familiar with the name. Ed.] were noticed under the old crop of Scots Fir still standing; but many were dead or dying from some unknown cause, although both aphids and fungi of some kind were noticed.

After leaving this wood, the drive was continued to Woburn Park, and the party had an interesting walk through the plantation known as the Evergreen, planted in 1743 on a heathy rabbit-warren. It was in connection with this plantation that the Duke of Bedford of that day differed from the views held by his gardener, a fact which he announced to the world by putting up a notice-board at the edge of the adjoining high-road with the following legend:—"This plantation was thinned by John, Duke of Bedford, contrary to the advice and opinion of his gardener." At the present time the majority of the trees have matured, and many interesting specimens of Cedars, Plymouth Pines, and other Conifers were noticed. Of especial interest was a very fine Larch, apparently *L. sibirica*, about 100 feet in height; and a young arceuth of various species of the Silver Fir tribe also looked remarkably well.

Proceeding through the beautifully-timbered park to the Abbey, the Society experienced the proverbial hospitality of the House of Russell, and afterwards inspected the Abbey and gardens. The famous Woburn Beech, figured by Porbey in his *Forest Primer* in 1810, came in for a good deal of attention. Its height up to the first limb is 50 feet, and its girth at 5 feet up 14 feet 6 inches, and is reckoned to contain nearly 600 cubic feet of timber. Unfortunately Porbey gives no girth measurements of this tree, otherwise a comparison of data would have been both instructive and interesting. Some splendid specimens of both the pedunculate and sessile-flowered varieties of Oak were also seen, remarkable as much for their beauty of form as their size. An inspection of the home farm and other features, and the interesting collection of American hirsens, deer, and other animals in the park completed the day's work.

On Wednesday the 29th, the first item on the day's programme involved a long drive to Wreat Park, the historic seat of Earl Cowper. A fine avenue of Wych Elm and Spanish Chestnut intersects the park; but the gardens of Wreat are its great feature. Laid out in the style prevailing at the end of the seventeenth and beginning of the eighteenth centuries, Wreat probably illustrates one of the most perfect examples of the formal style of gardening in the country (see *Gardeners' Chronicle*, vol. xxvii, 1900, p. 375, et seq.). Its temples, statuary, grottoes, oblong canals, vistas, pleached and grassed alleys, Yew hedges, &c., exhibit a character beside which modern ideas on garden planning seem weak and puny. Unfortunately the creators of such gardens only see the effect of their work in imagination and not in reality; and perhaps this is one reason why the imitation of them to-day is not more popular. To arboriculturists, the fine timber-trees standing here and there throughout these beautiful pleasure-grounds were of great interest—Beech, Ash, Wych Elm, &c., of noble proportions; and amongst the Beech was one little behind the famous specimen at Woburn, and having a girth of about 13 feet at 5 feet up.

Returning from Wreat a halt was made at Amphill for lunch, after which the historic old Oaks in the park there were visited. Many of these were pollards, and all were extremely picturesque old trees. The largest had a girth of 29 feet 6 inches, while out of sixteen of the largest trees only four had a girth of less than 20 feet. In addition to their age and size, their healthy and vigorous appearance probably render them the finest collection of old Oaks in the county, and one of the finest in England.

A move was next made to the Experimental Fruit Farm at Ridgmont, where Mr. Spenser Pickering and Mr. Lewis Castle met the party. The various experiments on the growing of fruit-trees were pointed out and explained. To foresters, the most interesting fact elicited was the injurious effect of a grass covering to the surface soil, proving the advisability of pit-planting on turf; while the nurserymen present derived much comfort from the statement that careless planting gave equally good results as those derived from careful work. A short visit to the Woburn Experimental Station of the Royal Agricultural Society brought to a close a hard day's work, which, in spite of thunder-showers, had proved a most enjoyable one.

The third day's proceedings contained visits to Ashridge Park, Tring Park, and Mentmore. At Ashridge

were seen probably the finest Beech timber that can be found in an English park. Straight, clean stems running up for 60 or 70 feet without a branch, and containing 200 or 300 feet of sound timber were not uncommon, and many parts of the park reminded one more of a Beech forest than an ordinary park. But even the forestry instincts of the Society were temporarily forgotten when the magnificent mansion came into sight. Its size, age, and the beauty of its architecture render it one of the most famous seats in England; and the gardens and grounds adjoining are equally attractive. The Lime-tree Walk, the Monk's Garden, and the avenues of ornamental Conifers were features almost perfect in themselves, and were so situated that neither clashed with the other. A tree of great interest was the Oak planted by the late Queen, and which has already a girth of about 8 feet and a large spreading head. A good specimen of *Fagus antarctica* was also noticed.

From Ashridge the excursionists proceeded to Tring Park, the fine seat of Lord Rothschild. At the entrance gate they were met by Mr. Richardson Carr (the agent) and Mr. Smith (forester), and conducted to the home nursery close by. These nurseries are used for the raising of fruit trees, Roses, shrubs and forest trees, and being high and on stiff, loamy soil, produce sturdy plants fit to go anywhere. A bed of Larch and other seedlings attracted much attention, and it was evident that Mr. Smith was a skilful all-round culturist.

Leaving the nursery on their way to the mansion, some fine young Beech and Oak were passed through, and the almost entire absence of rabbits both here and at Woburn accounted in a great measure for the satisfactory results obtained.

The gardens having been inspected, the Society was entertained at luncheon by Lord Rothschild, and then went round the farm and private museum, the latter having a world-wide reputation. Later on, the Mentmore gardens were visited.

On Friday a day was spent in the Beech woods round High Wycombe, and the system of natural regeneration there adopted studied. One or two of the principal chair factories were gone through, and the business part of the excursion was brought to a close, the general impression being that the twenty-sixth excursion of the Society had been both instructive and enjoyable, and that the best thanks of all were due to those noblemen and gentlemen who had assisted and entertained the party so generously. A. C. F.

BRITISH PTERIDOLOGICAL.

AUGUST 3.—The annual meeting of this Society was held in the Institute, Bowness, on the above date. There were present Dr. Slansfield (President) and a fair number of other members, both local and general. The Secretary's and Treasurer's reports showed the financial affairs of the Society to be in a sound condition.

The President in his opening address made reference to the gaps which had been caused by death in the ranks of the Society since he last met the members, and expressed his pleasure at meeting many old and some new friends. He congratulated the Society on the publication of the book of *British Ferns* which had been compiled by members of the Society, under the editorship of the late President, Mr. C. T. Drury, containing up-to-date lists, with details and dates of origin, of all the best varieties of the various British species of Ferns. He urged the members to keep a watchful eye upon the book, so that in any future edition any possible flaws might be corrected, and new matter bearing upon the subject be inserted, so that the book might continue to be the standard work of reference upon the subject. Several of the chapters on asporous, &c., by Mr. Drury and others, had never before been published in popular form, and would constitute a feature of great biological interest in the book.

The election of officers for the ensuing year was then gone through, most of the old officers being re-elected, but with some changes among the vice-presidents and committee. The place of meeting for next year was again fixed at Bowness, this being fairly central for members from England, Ireland, and Scotland, as well as being an attractive place of meeting from its natural advantages and surroundings.

Two papers by Mr. C. T. Drury were read, in the absence of the writer, by the President, their subject being "Varietal Types of British Ferns," and "The Propagation of Varieties of *Lastrea montana*." The President also read a paper of his own upon "The Study of the Abnormal." A short discussion followed, in which Mr. Garnett, Mr. Phillips, Mr. Whiteside, Mr. Edwards, and others took part. Mr. Garnett expressed his strong belief in the influence of environment in the production of varieties, and it was pointed out that there was a strong case in point in a beautiful crested form of Lady Fern which had been picked up last year in this neighbourhood by Mr. Phillips as a slightly abnormal but not crested form. During the year, however, that it had been under cultivation it had developed into a very fine crested or cristata form. The plant was exhibited by Mr. Phillips.

Mr. Garnett exhibited a very promising plumose setigerum form of *Athyrium*, but the Fern was not yet mature, and it was thought desirable to defer naming it for another year. Mr. J. Loveday exhibited some very finely-grown crested forms of *A. f. setigerum*; Mr. Henry Bolton, Mr. Loveday, Mr. Praeger, and others, exhibited fronds, all of more or less interest and importance. The sensation of the year, however, was a magnificent thoroughbred grandiceps form of *Lastrea montana*, which had been found within a few days in Longsleddale by Mr. Smithies. The Certificate of Merit of the Society was awarded to this Fern under the name of *Lastrea montana grandiceps*, Smithies. It is singular that Mr. Smithies is the only previous finder of a grandiceps form of *montana*; the present find, however, quite surpasses previous records of this type in this species, and is equal to the best grandiceps forms found in other species. The meeting concluded with votes of thanks to the writers of the papers, which, it was decided, should be published in the Transactions of the Society.

MEETING OF THE GHENT CHAMBRE SYNDICALE.

AUGUST 3.—At the meeting on the above date of the Chambre Syndicale and of the Société Royale d'Agriculture et de Botanique of Ghent, the following awards were made:—

Certificates of Merit for cut blooms of Phlox, from M. C. KERKVOORDE (*par acclamation*): for *Cattleya* hyb. *C. Schilleriana* × *C. Gaskelliana*, from M. F. DE BIÈVE, of the Royal Gardens of Laeken (*à l'unanimité*); for *Lælio-Cattleya* (*L. elegans* × *C. Warneri*), from M. A. PEETERS, of Brussels (*par acclamation*); for *C. gigas* var. *Mlle. M. Henriette de Wavrin*: for *C. hyb.* (*C. Schofieldiana* × *C. aurea*) (*par acclamation et avec félicitation du Jury*)—both these exhibits also were from M. PEETERS.

Certificates were also allotted for *Cattleya Withei* (*C. Schilleriana* × *C. Warneri*); for *Lælio-Cattleya* Herman Holmes (*L. purpurata* × *L. C. Schilleriana*) (*à l'unanimité*); for *Cattleya Gaskelliana*, and for *C. Wavriniana* (*C. gigas* × *C. Schofieldiana*)—all these from the Marquis DE WAVRIN.

A Floral Certificate fell to M. CH. GAZELLE, for *Veronica purpurea*; a Cultural Certificate to the Marquis DE WAVRIN, for *Bulbophyllum barbigerum*; and Honorable Mention for *Begonia Triomphe de Gand*, from M. PIERRE PARRÉ.

BASINGSTOKE HORTICULTURAL.

AUGUST 3.—The twenty-seventh annual summer show was held in Goldings Park on the above date. Plants were numerous and good; and for nine specimen stove and greenhouse plants, diverse, Mr. Hunt, gr. to R. Moss, Esq., Fern Hill, Blackwater, was 1st, he having magnificent specimen of *Allamanda Hendersonii*, and others very good. Mr. Wasley, gr. to J. B. TAYLOR, Esq., Sheffield Manor, Basingstoke, was a very creditable 2nd. Mr. WASLEY also was awarded the chief prize for four specimen foliage plants, his *Kentia Belmoreana* being an excellent specimen of this fine Palm. Mr. HUNT was a close competitor. The latter gardener was the winner of the 1st prize for four flowering specimens, including a very well-flowered one of *Acalypha Sanderiana*.

Fuchsias were exhibited in a manner much superior to what one is accustomed to observe nowadays. Mr. T. Russell, gr. to R. BLENCOWE, Esq., Shippett's House, Basingstoke, was an easy winner of the premier place with four pyramids measuring 7 feet in height, shapely plants, well flowered. This gardener was likewise 1st for one specimen *Fuchsia*, with *F. elegans* measuring 8 feet in height.

Coleus were remarkable for bright colouring; and Mr. Best, gr. to F. D. LEYLAND, Esq., The Vyne, Basingstoke, was 1st for four pyramidal examples 5 feet in height; and he was 1st for a group of miscellaneous plants arranged so as to afford effect.

Exotic Ferns were excellently shown by Mr. WASLEY, who was 1st for six specimens, remarkable for healthy and vigorous appearance. Mr. HUNT was 1st for four *Liliums*. Cut flowers were shown in abundance; and Mr. Neville, gr. to F. W. FLIGHT, Esq., Cornstiles, Twyford, Winchester, was 1st for twenty-four and twelve, and also for twelve blooms of Tea Roses, in all cases showing capital examples. He was likewise the principal prize-winner for cut blooms of Carnations and Picotees, winning the highest award in a class for bunches of these flowers, as well as in the specimen bloom class. Mr. HUNT was 1st for twelve bunches of diverse hardy herbaceous perennials. The 1st prize for six bunches of Sweet Peas was taken by Mr. C. W. BREADMORE.

FRUIT.

This was good in every respect. The best six dishes were shown by Mr. WASLEY, and consisted of finely-berried bunches of Madresfield Court Grapes, a Melon, Peaches, and Onlin's Golden Gage Plum; Mr. HUNT was 2nd. Mr. TAMPLIN had the best bunches of Black

Hamburgh Grapes in a class set apart for that variety. A dish of the Peach, Nectarine, and one of exquisite Pineapple secured for Mr. WASLEY the 1st place. Windsor Castle was considered by the Judges to be the best green-fleshed Melon, it was shown by Mr. TAMPLIN. In Sutton's scarlet-fleshed varieties Mr. HUNT was 1st.

Vegetables were excellent in quality but less numerous than usual. Mr. Kueller, gr. to Sir W. PORTAL, Malshanger Park, was 1st for Messrs. Sutton's prize for six, and also for the Society's competition with eight kinds; Mr. BEST was 2nd in each of these classes.

Messrs. B. LADHAMS, Ltd., Shirley, and Mr. M. PRICHARD, Christchurch, exhibited hardy herbaceous perennials, *Gladiolus*, &c.

NEWBURY HORTICULTURAL.

AUGUST 3.—The fifty-seventh annual exhibition of this Society was held at Goldwell Park on the above date, and was equal to any previous show, the large tent in which plants were displayed being filled. Fruit was excellent, as were also vegetables. In recent years adverse weather has influenced the attendance of visitors, but on the last occasion the weather was propitious, and the show was abundantly visited by people from the town and from villages around.

The Committee depend entirely on horticulture, and entertainments of other descriptions are not favoured. The Society has as its President the Mayor of Newbury for the time being, who is well supported by the Corporation and others.

That widely known gardener, Mr. CHAS. ROSS, usually leads in all classes. This year he was less prominent, owing to a change of resident at Welford Park, and the sale of his favourite stove and greenhouse plants. He is, however, not readily beaten in fruits, vegetables, and out-flowers.

The Hannington Champion Shield, one of the most coveted prizes, was on this occasion awarded for the most successful exhibitor at the show taking the most prizes.

The Open class (Div. 1) was the weakest in the show, due to the absence of the Welford plants; still, those gardeners who staged had excellent material, especially the 1st prize lot from Mr. T. LEITH, gr. Beaurepaire Park, Hants, whose specimens of *Clerodendron Ba-fourianum*, *Allamandas*, *Stephanotis*, and others, were very good; Mr. T. SURMAN was a close 2nd, especially fine being his *Ixoras* and *Stephanotis*.

For foliage plants Mr. LEITH was 1st showing large *Codiaeums* and large-leaved foliage plants; 2nd, Mr. C. ROSS with small plants beautifully grown. Mr. C. ROSS also secured the highest award for the best foliage plant, as did Mr. T. LEITH for *Exotic Ferns*. *Coleus* made a grand display and the competition was keen, well-grown plants being in general shown, the awards in the order of their value going to Messrs. SURMAN, gr. Donnington Grove; R. C. NORRIS, Kingsclere; and Mr. C. ROSS.

Fuchsias, always a notable feature at Newbury, were present in fewer examples than formerly. Mr. T. SURMAN was an easy 1st with capitally flowered plants 8 to 10 feet in height; 2nd, Mr. G. A. COX, with smaller specimens.

Begonias were numerous shown and of the best quality. For double-flowered varieties, Mr. CLARK and Mr. KING divided the awards; and in the single-flowered varieties Messrs. HOPSON, SURMAN, and NORRIS were the principal winners. There was a lively competition for the best plant in bloom in the show, and Messrs. SURMAN, ROSS, and ABERY (Tilehurst), secured the awards, the first named having a magnificently flowered *Hydrangea* 7 to 8 feet in diameter.

A special feature at Newbury is what is termed a model conservatory arrangement, this is effected by the use of elevated stages, and the effect is very good when well done. There were five good exhibits of this kind, Mr. J. HOWARD, Benham Park Garden, being 1st; Mr. NORRIS was 2nd, and Mr. C. ROSS, 3rd.

Cut flowers were very good in every class. Roses in the Open classes were good, though small of size. Messrs. COOLING & SON, Bath, were 1st; and Mr. TRANTER, Henley, 2nd. In the local class, Lady SUTTON was a good 1st; and Mr. MEAD, 2nd, the premier stand having some very good Teas that were beautifully fresh-looking; and the Amateurs' Roses were particularly nice. Dahlias were plentiful, Mr. TRANTER being an easy 1st, and Mr. BOSLEY 2nd; and the class for miscellaneous cut flowers was well filled, Mr. T. LEITH being 1st, and Mr. W. T. ABERY, 2nd. Carnations were well shown by Mr. TRANTER, 1st; and Mr. SMITH, 2nd.

Fruit.—Grapes and Peaches were excellent. The best six dishes, distinct, were shown by Mr. HOWARD; and Mr. R. MAHER, gr. Yattendon Court, was 2nd. For Black Hamburghs, Messrs. SURMAN, HOWARD, and LEES were the leading competitors, the bunches being in each case of fine quality. Other Black varieties were shown by Mr. SURMAN. Mr. HOWARD, and Mr. GALL, who won 1st, 2nd, and 3rd prizes in the order given. Mr. GALL, gr. Aldermaston Court, showed Muscat of Alexandria, exceedingly good in berry and bunch; Mr. ROSS being 2nd, and Mr. MAHER, 3rd.

Mr. LEES and Mr. COX had the best Melons, and Mr. LEITH, Mr. ROSS, and Mr. MORRIS showed very fine Peaches; and Mr. LEES, Mr. LEITH, and Mr. HOWARD the finest Nectarines. Mr. HOWARD had the best Pine-apple.

Vegetables, mostly from artisans and cottagers, were very good and numerous. There were very few exhibits from nurserymen.

Roses came from Mr. RIGG, Caversham; and some good fruit was shown by local growers in single dishes. Lord Beaconsfield Raspberry, from Mr. FAULKNER, was very fine. G. W.

MIDLAND CARNATION.

AUGUST 6.—The Carnation in all its types was seen in excellent character in the Show House of the Birmingham Botanical Gardens on this occasion. It is an ideal place in which to hold a Carnation show; overhead two large specimen Bougainvilleas were in full bloom, and round the sides, forming a leafy background to the cut blooms, were Fuchsias in bloom and other plants. It was the last exhibition in the Gardens during the Curatorship of Mr. W. B. Latham, and his arrangements were, as usual, excellent. The weather was fine and the attendance was large. The quality of the bloom, as is usual at Birmingham, was very good, the entries numerous and the competition keen.

Self Carnations.—These occupied the foremost place in the schedule of prizes, and there were seven competitors with twelve blooms, [Mr. R. C. CARTWRIGHT, King's Norton (gr., G. Rudd), taking the 1st prize with finely-developed blooms of Ensign (white), Bomba, Sir Bevy's Lustre (rich deep rose), Comet, Seagull (a lovely bluish variety), Benbow (buff), Mrs. E. Hambro, Mrs. Colby Sharpin (bright cinnamon), Germania (still the most refined yellow self), Enchantress, and Mrs. Prinsep (another yellow self). Mr. A. W. JONES, Stechford, was 2nd; he had, differing from the foregoing, Agnes Sorrel, Much-the-Miller (a fine white), Dudley Stuart, Nubian, Tredegone (rose), and Sultan. Mr. C. F. THURSTAN, Wolverhampton, was 3rd with a stand of excellent blooms.

There were twelve competitors with six selfs. Mr. W. H. PARTON, jun., Highfield, King's Heath, taking the 1st prize with superb blooms—Much-the-Miller, Nubian, Barras, Almoner (a fine-petalled yellow), Agnes Sorrel, and Mrs. E. Hambro. The Rev. G. C. GOTTWALTZ, Hadsor, Droitwich, came 2nd; he had Richard Dean (new, a distinct purple self), Burn (bright pale red), John Pope, Avalanche, &c.

Picotees with Yellow Grounds.—These were of very fine quality. Mr. M. R. SMITH, Hayes Common (gr., Mr. C. Black), taking the 1st prize with twelve finely-developed blooms of Franklyn, Badoura, Countess of Darnley, Daughter of Heth, Lady Anebry, Coquette, Countess of Verulam, Morgiana, Isolt, Approoite, Mrs. Walter Heriot, and Danore, several being novelties not yet sent out. Mr. A. W. JONES came 2nd, also with very good blooms indeed, representing varieties in commerce—viz., Lady Bristol, Hesperia, Gronow, Alcinous, Lady St. Oswald, Mohican, Badoura, Mrs. Hadley, and Gertrude, with three others.

There were fourteen competitors with six varieties, and Mr. W. H. PARTON, jun., took the 1st prize with excellent blooms of Gronow, Hesperia, Mohican, Alcinous, Lady St. Oswald, and Gertrude.

Carnations, Fancies.—These were very finely shown, and the competitors in classes for twelve and six blooms were many. Here again Mr. W. A. JONES was 1st; he had superb blooms of Voltaire, Queen Bess, Argosy, Oakley, Alexandra, The Gift, Ivo Sebright, Charles Martel, Eldorado, Brodick, Achilles, and Oberon. Mr. R. C. CARTWRIGHT came 2nd, having, differing from the foregoing, Emperor, Amphion, Hidalgo, Euryalus, Pagan, Duke of Alva, and Renegade.

There was a keen competition with six varieties, unfortunately a class which was overlooked in the course of note-taking.

Picotees, White Grounds.—These also were shown in very fine quality. The 1st prize for twelve blooms was awarded to Mr. F. W. GOODFELLOW, who had of red edges Brunette and Morna, heavy; Mrs. Gorton and Thomas Williams, light purple edges; Amy Robsart and Mrs. Openshaw, heavy; Harry Kenyon and Pride of Leyton, light; rose and scarlet edges, Lady Louisa, Little Phil, and Mrs. A. R. Brown, heavy; Fortrose, light, 2nd, Messrs. THOMSON & Co., nurserymen, Sparkhill. They had in good character: Red edges, Brunette and Morna, heavy; Mrs. Gorton, light; purple edges, heavy, Amy Robsart and Mrs. Openshaw; light, Mrs. Gorton; rose and scarlet-edged, heavy, Little Phil, Mrs. Beswick and Mrs. Payne; light, Favourite and Fortrose.

With six varieties, Mr. D. WALKER took the 1st prize out of eleven competitors. He had Fanny Tett, H.P.E.; Cho, H.Ro.E.; Mrs. Openshaw, H.P.E.; Little Phil, H.Ro.E.; Grace Darling, L.Red.E.; and Brunette, H.Red.E. Mr. E. C. ROSSITER was 2nd. He had L.Red.E. Thos. William, H.Red.E. Brunette, H.Ro.E. W. H. Johnson, L.Ro.E. Favourite, H.Ro.E. Little Phil, and H.P.E. Fanny Tett. Mr. C. F. THURSTAN, 3rd.

Carnations, White Grounds.—With twelve blooms, Messrs. THOMSON & Co. were 1st, there being five com-

petitors. They had finely-developed blooms of S.B.'s George, Robert Houlgrave and Robert Lord; C.B. Master Fred; P.B.B. Wm. Skirving and Geo. Rudd; P.F. Gordon Lewis and George Melville; S.F. Guardsman, Sportsman and Meteor; R.F. Mrs. Rowan. Messrs. W. PENBERTON & SON, florists, Walsall, were 2nd. They had very good blooms also of much the same varieties.

There were nine competitors with six blooms. Mr. F. W. GOODFELLOW was 1st, with S.B. Admiral Curzon and George, C.B. Master Fred, P.P.B. George Rudd, P. F. Gordon Lewis, and S. F. Sportsman; Mr. D. WALKER was 2nd; and Mr. E. C. ROSSITER, 3rd.

Single Blooms.—A very large number of single blooms was staged, and the awards of the judges were as follows, the first three awards being given; where one variety only is mentioned it is because it took all three prizes:—S. B. Robert Houlgrave, C. B. Carnation Master Fred, 1st and 2nd, and J. S. Hedderley; P. P. B. George Rudd, 1st and 2nd; W. Skirving, S. F. Sportsman, in such fine character that it was 1st, 2nd, 3rd, and 4th; R. F. Merton, 1st and 3rd; Mrs. May, 2nd; P. F. Gordon Lewis, H. Red E. Picotée Brunette, L. Red E. Mrs. Gorton, H. P. E. Mrs. Openshaw, 1st and 2nd; Amy Robsart, L. P. E. Pride of Leyton, 1st and 2nd; Lavinia, H. Rose E. Mrs. Payne, 1st and 2nd; Little Phil, H. Scarlet E. Mrs. Sharp, 1st and 2nd; W. H. Johnson, L. Rose E. Fortrose, 1st and 2nd; Favourite, Y. G. Picotée Gertrude, Y. G. Fancy Charles Martel, Brodick, Voltaire, Fancy other than Y. G., Dalgetty, Delightful, and Muletter; Self, white, Ensign, Mrs. E. Hambro; buff, Mrs. R. C. Cartwright, Benbow; scarlet Etna, Isinglass; yellow, Seymour, Corcoran, Goliath, Germanis; rose, Lustre, 1st and 2nd, John Pope; dark crimson, &c., Cussadra, Lady Jane Grey, Jocelyn, the second and third heliotrope, the last named much the darkest.

Undressed Flowers.—It was universally admitted that these were very fine, and just in proportion as refinement is secured in new varieties so will the intervention of the dresser be less required. There were classes for twelve and six selfs, and also for twelve and six fancies. Each bloom staged in a small vase with Carnation foliage. Mr. C. F. THURSTAN had the best twelve selfs, and Mr. W. H. PARTON, JR., the best six selfs; the latter also had the best six fancies, and Mr. CARTWRIGHT the best twelve. Some of the flowers were unnamed.

Eight classes were set apart for blooms staged in threes, in vases with foliage. Mr. A. W. JONES had the best twelve in threes, and Mr. PARTON, JR., the best six. Six of the classes were for six blooms of one variety, shown in a vase, and this made a very pleasing feature.

There was as usual three classes for novices, in which the competition was numerous and keen; these classes serve as a recruiting-ground to the number of exhibitors.

Premier Flowers: Bizarre, S. B. Robert Houlgrave, from Mr. D. WALKER; flake, P. F. Gordon Leves, from Messrs. THOMSON & Co.; Heavy-edged Picotée, H. P. E. Mrs. Openshaw, from Mr. F. W. GOODFELLOW; Light-edged Picotée, Pride of Leyton, from Messrs. THOMSON & Co.; Self, Ensign, white, Mr. R. C. CARTWRIGHT; Fancy, Ivo Sebright, Mr. A. W. JONES; Heavy-edged yellow Picotée, Gertrude, Mr. W. H. PARTON, JUNR.; Light-edged Y.G. Picotée, Mrs. W. Heriot, Mr. M. R. SMITH. In the undressed sections the Premier Y.G. Picotée was Gronow, Mr. W. H. PARTON; Fancy, Strongbow, Mr. M. R. SMITH; and Self, Sappho, Mr. C. F. THURSTAN.

Floral decorations were represented by shower bouquets (the best from Mr. W. B. LATHAM, Botanic Gardens), sprays and button-holes. A class for a round table, 2½ feet in diameter, having an arrangement in Sweet Peas, brought a well-finished one from Mrs. MARTIN, Erdington, which obtained 1st prize. Mr. R. SYDENHAM's special prizes for twelve bunches of Sweet Peas brought several competitors, and some of the finest blooms seen this season.

Miscellaneous exhibits provided pretty features, and Silver-gilt Medals were awarded to Messrs. HEWITT & Co., for Floral Decorations and Cut Flowers; to Messrs. B. R. DAVIS & SONS, Yeovil, for very fine Begonias; and to Messrs. FELTON & Co., for Vases of Carnations and Floral Decorations. Large Silver Medals to Messrs. DICKSONS, Ltd., Chester, for Hardy Flowers; to Messrs. J. H. WHITE & SON, Worcester, for Hardy Flowers, &c.; and to Mr. VINCENT SLADE, Florist, Taunton, for Cut Zonal Pelargoniums. Small Silver Medals were awarded to Messrs. CUTBUSH & SON, Highgate, for Malmesbury Carnations; to Messrs. SIMPSON & Co., Birmingham, for Sweet Peas; to Mr. WATTS, for Seedling Carnations; and to Mr. W. SYDENHAM and Mr. W. L. PATTISON, for Cut Violas.

KINGSTON - ON - THAMES FRONT FLOWER - GARDEN COMPETITIONS.

The interest in these competitions, created a few years since, seems to be still as strong as ever, for this year the number of competitors, or at least of entries, was nearly seventy. The town is, for the competitions, equally divided into North and South sections, and in

each section there are classes for gardens over half a rod in area, for smaller gardens, and for the best decorated window-fronts. In all cases the houses to which gardens or fronts are attached must not be rated higher than £20, neither must any hired labour be utilised.

The best large gardens are found this year in the Northern division, and M. HOMES, who had some singularly pleasing features, just displaces, by two points only, J. PUNTER, who has been 1st in preceding years, with a charming little garden. In the South section window-fronts are best, and J. NORRIS, a carter in the employ of the Corporation, presents a florally decorated house-front with Virginian Creeper for a backing that is indeed a beautiful town picture.

In the six classes thirty prizes have been awarded. The judges were as usual Messrs. J. WRIGHT, V.M.H., and A. DEAN, of the Surrey County Education Committee.

LAW NOTES.

CLAIM FOR GOODS WRONGFULLY REMOVED.

TUDGEY v. L. & S.W. RAILWAY.

THIS case came on for hearing at the Chertsey County Court on Thursday, August 6, and was a claim by Mr. Edward Tudgey, nurseryman, late of Walton, now of Fleet, Hants, for £21 8s. 7d., against the L. & S.W. Railway Company, for goods wrongfully removed. Mr. T. E. H. Chaldecott was for the plaintiff, and Mr. H. L. Cancellor (instructed by Mr. S. Birchar) defended. The plaintiff's statement was that his lease having expired he removed to Fleet. One truck of goods was delivered to another firm at Fleet, where they were utilised. Subsequently he (plaintiff) found this out, and entered a claim for that part of the goods which were destroyed. Mr. Cancellor handed in an invoice on which was printed that the goods were sent at owner's risk. The plaintiff said he had never read it. His Honour (reading) said the consignor agreed to exonerate the company from any liability, damage, or mis-delivery, in consideration of having the goods carried at a lower rate. He then handed the invoice to the plaintiff, remarking, "You had better read that." Mr. Chaldecott said his client had not signed it. Plaintiff: "It was one of my men, or my son." His Honour: At the same time it has been signed by your client's agents. Most people usually do not read the invoice very closely when signing; it is a pity they do not. It seems to me a hopeless case. The next time the plaintiff should read the invoice. I give judgment for the defendant company. Mr. Cancellor: With costs? His Honour: Under the circumstances you might forego that. Mr. Cancellor: We have got a defence on the merits of the case, and I must press for costs. His Honour: Of course, if you press for it you are entitled to the costs.

PRESENTATION.—An interesting event took place at the summer show of the Bishop's Stortford Horticultural Society, which was held on Wednesday in the grounds of The Grange, Bishop's Stortford, by permission of Mr. JOHN BARKER, J.P. It was the presentation to Mr. WILLIAM SMITH, the late Honorary Secretary, of his portrait in oils, in appreciation of the admirable way he has carried out the duties since the formation of the Society in 1870. The presentation was made on the Terrace at The Grange by Mr. TRESHAM GILBEY, the President for the year, in the presence of a large and distinguished party of visitors. The President remarked that since the Society was started it had seen its ups-and-downs, but in Mr. SMITH they had had the right man at the helm, and the show was now the best within 60 miles of London. This was entirely due to the energy and unflinching pluck of their late Honorary Secretary. Sir WALTER GILBEY and Mr. JOHN BARKER endorsed these remarks; and Mr. SMITH, in reply, said the fortunate position he was in was quite as much due to force of circumstances as to his own merit.

FLORAL DECORATIONS AT DUBLIN CASTLE DURING THEIR MAJESTYS' VISIT.—Messrs. CHARLES RAMSAY & SON, the Royal Nurseries, Ball's Bridge, were entrusted with the entire floral decorations of Dublin Castle during their Majesties' visit, including the State apartments, drawing-rooms, Throne-room, St. Patrick's Hall, and King's supper-room. Over 8,000 Roses, 5,000 Bermuda Lilies, and immense quantities of Smilax, Palms, exotic and flowering plants, were used in the decoration of St. Patrick's Hall on the occasion of the Royal Court. The Hall was never seen to better advantage, and the effect produced by the floral adornment was one of a highly artistic character. The balconies at each end of Hall were festooned with garlands of Roses, caught up at the ends with trophies of Lilies. On the top of the balconies were banks of Roses, and at the back of these were Marguerites, Lilies, and foliage plants. The pillars were all twined with garlands of Roses, the total number—all crimson Roses—used in the decoration being over 8,000. Underneath the chandeliers were huge baskets of flowers, Roses and Lilies, with trailers of Asparagus Sprengeri. At both ends of the Hall there were similar baskets of flowers. The grand staircase of the State apartments was handsomely decorated with banks of flowering plants, Ferns, and trailing plants. The King's supper-room was prettily adorned with pink Roses and Lilies, garlands of these flowers being suspended from the ceiling. The mantelpieces were banked also with pink Roses and Lilies, and the Royal supper-table was artistically arranged with pink Bridesmaid Roses and Smilax. The entire decorations reflected the highest credit on the good taste displayed by the firm. *Irish Times, August 12.*

the close; but over the southern and eastern parts of England the weather was much finer and drier after the middle of the week. On the western and southern coasts a good deal of mist or fog was reported in the earlier part. Thunder occurred at Marchmont on Thursday, and at Markree Castle and Plymouth on Saturday. On Wednesday a large meteor was observed at Scarborough, falling nearly vertically.

The temperature equalled the average in Scotland, E. and W., England, N.E. and N.W., and in the Channel Islands, all other districts returning a deficit of 1°. The highest readings were observed on various days, the maximum of 79° in London and 77° at Cambridge and Jersey occurring on Saturday. Many of the northern maxima were below 60°. The lowest night values were recorded in the inland parts of England and Ireland during the fine spell of the second half of the week, 38° in the shade being registered at Swarraton and Markree Castle, and 39° at Cirencester.

The rainfall, although frequent, exceeded the average only over Scotland and the North of Ireland. In the Channel Islands the amount was very trifling, and in several parts of England and Ireland the aggregates were from one-third to one-half the average. At Blackpool 1.1 in. fell on Sunday, and at Fort William 1.2 in. on Saturday, but as a rule the individual falls were small.

The bright sunshine was deficient in the North of Scotland, but over the rest of the country there was an excess as much as 10 to 19 per cent. in some districts.

THE WEATHER IN WEST HERTS.

For more than a month there have occurred only two seasonably warm days, and on five nights during that period the exposed thermometer indicated readings within 8° of the freezing point. On the one warm day of the past week, the temperature in the thermometer screen rose to 75°, which, although only about 5° above average, was nevertheless the highest reading recorded here for nearly a month. At 2 feet deep the ground is now of about seasonable warmth, but is still 2° colder than the average at 1 foot deep. No rain fell during the six days ending the 8th, but the last two days have been very showery. The total fall for these two days was, however, less than 1/4 inch. No measureable quantity of rain-water has now come through the bare soil percolation gauge for three days, and not any for five days through the gauge on which short grass is growing. The sun shone on an average for seven hours a day, or for more than an hour a day in excess of the August average. The winds were again as a rule rather high, and came mostly from some westerly point. The amount of moisture in the air in the middle of the day proved variable, but taking the week as a whole there was more than a seasonable quantity. *E. M., Berkhamsted, Aug. 11, 1903.*

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period August 2 to August 8, 1903. Height above sea-level 24 feet.

Remarks.—With the exception of a little rain on the 2nd inst., the weather during the week has been fine and bright.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending Aug. 8, is furnished from the Meteorological Office:—

The weather.—Very unsettled, showery conditions prevailed generally throughout the British Isles during the first half of the period, and continued to a more or less extent over the northern and western districts to

REMARKS.—Californian Plums in cases sell for 12s.; Cape Lemons, of good colour and texture, in cases of about 200, fetch 6s. to 8s.; Melons, in cases of 24 or 36, 8s. to 10s.; French William Pears, in sieves 12s., and in boxes 6s. to 7s.; Gages in sieves sell for 8s. to 12s., those in boxes 1s. 6d. to 2s. 6d. Broad Windsor Beans in bags fetch 2s., Dwarf Beans in bags 2s. 6d., Runners 2s. to 2s. 6d.; outdoor Mushrooms, in sieves or half-bushels, 2s. to 2s. 6d.

POTATOS.

Home-grown, 70s. to 100s. per ton. *John Ball, 32 & 34, Wellington Street, Covent Garden.*

FRUITS AND VEGETABLES.

GLASGOW, August 12.—The following are the averages of the prices during the past week:—Apples, Lisbon, 12s. to 15s. per case; Oranges, Naples, 9s. to 12s. per box; Lemons, 6s. 6d. to 10s. per box, and 10s. to 14s. per case; Melons, 6s. 6d. to 8s. per case; Grapes, English, 1s. 3d. to 2s. 6d. per lb.; do., Denis, green, 5s. to 7s. per barrel; do., black, 11s. to 13s. per barrel; Strawberries, 4d. to 10d. per lb.; Plums, French, 2d. to 6d. do.; do. Gages, 7d. to 9d. do.; Currants, red, in tubs for preserving, 16s. per cwt.; Gooseberries, Scotch and Irish Warringtons, 24s. to 28s. per cwt.; Mushrooms, 1s. to 1s. 6d. per lb.; Tomatoes, 5d. to 8d. do. Onions, 3s. 6d. to 6s. per case; Dutch Carrots, 5s. 6d. to 6s. per hamper.

MARKETS.

COVENT GARDEN, August 13.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. ED.]

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Wheat	31	7	29	3	—	4
Barley	24	11	20	1	—	10
Oats	22	11	18	8	—	3

**** EDITOR AND PUBLISHER.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the literary department, and all plants to be named, should be directed to the EDITOR. The two departments, publishing and editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

A REMEDY FOR AMERICAN-BLIGHT ON APPLE AND OTHER TREES: P. K. The small quantity sent was tried on American-blight on a small Apple-tree, the preparation being applied with a camel-hair pencil, in order to make the most of it. It seemed to spread over the cankered surfaces and into the cracks in the bark very readily, and the American-blight soon vanished from the parts to which the preparation was applied, leaving the surface of the worst-affected parts clean, and seemingly benefited by the application. The quantity available being so small, only a patch of American-blight here and there could be treated, and the greater part remained at the mercy of the pest. Notwithstanding that the parts in which the American-blight was left untouched were close to the parts from which they had been cleaned, the portions treated have not shown a fresh crop.

BEGONIAS CRIPPLED IN LEAF AND SHOOT: Perplexed. Caused by an exceedingly minute mite. Wash the plants with mild soap-suds in which a little commercial tobacco water is mixed.

BOOKS: W. R. T. We are not booksellers; but if the seven volumes are in good condition they ought to be worth at least 7s. 6d. a volume.

BLACK HAMBURG GRAPES RIPENING WHEN OF THE SIZE OF PEAS: A. C. We are unable to name the cause. Please send materials for examination.

CATTLEYA WARSCEWICZII (GIGAS) GROWING: O. G. As new growth has started you had better suspend the plant, or place it on an inverted flower-pot in a light situation in a warm house, and afford water carefully until the growth is completed. It is not unusual for this Cattleya to start fresh growth after flowering.

CONSUMPTION CURE: M. B. It would be arrant quackery and reckless cruelty on our part to affirm or endorse anyone else's affirmation that the leaves you speak of would cure consumption. They might palliate certain symptoms, or perhaps even aid in preventing the onset of the disease, but to cure it by such means is to attempt the impossible. M. D.

CUCUMBER: P. D. We cannot quite make out the position of the fruit from the photograph; accepting your explanation as correct, it is very unusual.

FUNGUS: M. M., Croydon. Lycoperdon giganteum. Cut in slices and fried it is excellent and safe eating, so long as it retains its snow-white colour.

GARDENERS' REFERENCES: E. B. You cannot be compelled to return them to the gardener under the circumstances.

GRAPES: Perplexed. The fruits sent are affected with Spot-fungus (Glæosporium), frequently mentioned in the *Gardeners' Chronicle*.

GRAPES MILDEWED: Crawford. The fruits are suffering from mildew (Oidium), and doubtless the foliage and shoots likewise. Stagnant air in theinery favours its development, and where the disease has once appeared there must be great care in damping and syringing. Flowers-of-sulphur in some form is the only remedy, the better way of applying it being to dust it over the Vines, and in the course of a few days to syringe it off the Vines.

GLASSHOUSE ROOFS: T. W. B. Galvanised iron, with or without putty, no laps to the panes, but instead butted ends, cut true. Roofing bars set 12 inches apart; panes 3 feet long, weight of glass 16 ozs. per foot. No paint is needed for galvanised iron, but Carson's anti-corrosion or ordinary paint may be used if the metallic colour is not liked.

KOCHIA: T. H. H. It is the natural thing for the plant to turn to a reddish colour; indeed, that is one reason why it is grown. Instead of asking for a remedy you should be glad to welcome the change.

LABOUR IN GARDENS, GROUNDS, PLANT AND FORCING-HOUSES, AND FOR KEEPING CLEAN 1½ MILE OF CARRIAGE-DRIVES AND 1½ MILE OF GRAVEL-WALKS: A. J. P. Twelve able-bodied men and one boy. If many of the workmen are aged, as is commonly the case, fifteen to sixteen might be necessary. We can, in answering questions such as this at a distance, only give a rough guess.

NAMES OF FRUITS: J. Kerss. Nectarine, No. 1, Pitmaston Orange if the glands are round and flowers large; No. 2, Fairchild's Peach Barrington. All the fruits deficient in flavour.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. E. M. 1, *Cephalotaxus Fortunei*; 2, *Bocconia cordata*; 3, *Olearia Haasti*; 4, *Mimulus glutinosus*.—W. B. 1, *Linaria striata*; 2, *Sidalcea malviflora*; 3, *Campanula Rapunculus*; 4, *Erigeron speciosus*; 5, *Sedum kamschatcicum*; 6, *Campanula rotundifolia alba*.—T. W. R. 1, *Pyrus americana*; 2, *P. intermedia*; 3, ditto. "Oak," *Quercus macrocarpa* var. *oliviformis* probably. "Wild plant," *Ononis spinosa*, *Juniperus sphaerica*.—Young Gardener. 1, *Matricaria inodora*; 2, *Potentilla Tormentilla*; 3, *Achillea Millefolium*; 4, *Hypericum quadrangulatum*; 5, not found; 6, *Solidago virga aurea*; 7, *Prunella vulgaris*; 8, *Lathyrus pratensis*; 9, *Galium uliginosum*; 10, *Lotus corniculatus*; 11, *Stachys silvatica*; 12, *Scrophularia nodosa*; 13, *Linaria vulgaris*; 14, *Achillea Ptarmica*; 15, *Bartsia Odontites*; 15A, *Solanum dulcamara*; 16, *Inula dysenterica*; 17, *Hypericum pulchrum*; 18, *Melampyrum arvense*.—T. Allium vineale (Crow Garlic).—W. D. *Hieracium aurantiacum*.—W. C. B. The loose flowers are those of *Eucomis punctata*; 1, *Cologyne Massangeana*; 2, not recognised, send again with particulars as to the nature of the plant.—W. A. 1, *Cyrtopodium ciliolare*; 2, *Cyrtopodium Curtisii*; 3, *Cyrtopodium exul*.—X. Y. Z. *Spiræa Nobleana*.—T. W. C. 1, *As-trantia major*; 2, *Alonsoa incisifolia*. Thanks for postal order, it has been placed in our collecting-box for the Gardeners' Orphan Fund.—W. T. *Hibiscus syriacus* (*Althæa frutex* of gardens).—W. R. M. *Aira cœspitosa*.—L. G. P. *Gaura Lindheimeri*.—W. T. The grass sent is too coarse for the purpose you mention.—Tumbridge. 1, *Hypericum Androsæmum*; 2, *Olearia Haastii*; 3, *Cimicifuga racemosa*; 4, *Lythrum Salicaria*; 5, *Veronica spicata*; 6, *Spiræa* (send leaf).—W. E. A *Lysimachia*; looks like the common wild one, but specimen is imperfect.—F. M. D. 1, Either *Deodar* or *Cedar of Lebanon*—we cannot tell the difference from the scrap sent; 2, *Saxifraga hypnoides*, probably no flowers; 3, *Lonicera brachypoda*; 4, *Nymphæa alba*, small variety.—S. K. B. The leaf is that of *Hymenocallis littoralis*; the

small plant, *Richardia Pentlandi* (yellow *Richardia*). Both grow well in an intermediate-house; and the *Richardia* may be planted out in summer, and lifted and potted in autumn.—W. D. 1, *Taxodium distichum*; 2, *Gleditschia triacanthos*; 3, *Rhus cotinus*; 4, *Eurya latifolia*; 5, *Gesneriad* (next week); 6, *Campanula Trachelium*, double fl.

PEA-HAULM DYING: A. J. P. The haulm is infested with mildew, and the roots have become rotten in consequence of a water-logged condition of the soil.

PEACH: D. Field. We are unable to name the variety from the fruit only—which, by the way, was not nearly ripe. You should have sent a shoot with leaves attached, and stated the size of the flowers.

PEACHES DISEASED: Crawford. The fruits have cracked and fungus has entered the stone, killing the kernel. The cracking may be due to too little moisture in the soil at one time and too much at another. You should keep the soil in a uniform state as regards moisture.

POTATO-TUBERS ON THE HAULM: C. T. & Co. Not uncommon. Often the result of injury to the underground tuber by wireworm or spade-thrust.

SHOT-HOLE FUNGUS: W. Priest. The attacks of this species, *Cercospora circumscissa*, are likely to be renewed from year to year, being favoured by the dispersion of the dropped-out portions of the leaf bearing conidia or spores. Use against it the ammoniacal solution of copper carbonate—the first time when the leaves are expanding, and repeating at intervals. The Bordeaux-mixture is too irritant for use on Peaches, &c.

SPOTTED TOMATO-SEEDS: John Kitley. I put about a dozen seeds in water for twelve hours, to soften and remove the cuticle for examination. At the end of the time only one seed showed any sign of a spot, and this was found to consist of cells like the rest, but of a brown colour, as if stained. Twenty other seeds were next put in water for twenty-four hours. At the end, only three showed a small irregular brown spot—found to be discoloured tissue; in all the rest the spots had vanished. Not a trace of mycelium or spore or parasite of any kind. M. C. C.

UNFRUITFUL STRAWBERRY PLANTS: A. B. L. The unfruitfulness may have arisen from the preponderance of female, and great or entire lack of male (pollen-bearing) flowers. This state of things may be brought about by the gardener selecting the runners always from the strongest (female) plants, which of course produce only female flowers, or males that are poorly supplied with pollen. In this manner it is easy for certain varieties to degenerate and become to a great extent barren. The genus is naturally diœcious, i.e., unisexual, bearing the male and female elements in different individuals. Some varieties are more inclined to degeneration than others.

ROSES AT NEWTOWNARDS.

ON the evening of the National Rose Society's magnificent exhibition in Glasgow, which was held on July 15 last, six members of that Society proceeded to Greenock, and thence by steamer to Belfast, under the guidance of one of the members of the party. On the following morning a pilgrimage was made to Newtownards, renowned throughout the world as the birthplace of many of the best of our modern Roses. On the arrival of the pilgrims at the nurseries, they received a most hearty welcome from Mr. George Dickson and the members of his family. After a short delay, in the hope that the rain, which had just set in, would cease, a move was made to the Rose-grounds. Here the party was joined by their chaplain, also a keen rosarian, and a member of the National Rose Society.

Under the untiring directorship of the brothers Dickson, the pilgrims plodded slowly up and down the apparently endless lines of new Roses. I say "slowly," because every few steps some attractive variety claimed attention, and had consequently to be commented on and its distinctive qualities duly noted. For five hours altogether, notwithstanding the steady downpour, they pursued with unflagging interest their in-

vestigations. Had any of their non-rosarian friends been present to watch the movements of these dripping enthusiasts, I am afraid they would not have formed a very high opinion of their mental qualifications. When I state that throughout the five hours no row was visited twice, and that new Roses only were inspected, some idea may be formed of the extent of the work undertaken by Messrs. A. Dickson & Sons at their nurseries in Rose-raising alone. Several thousand new varieties must have been inspected. Had the whole of the collection been in bloom, eight or ten hours would have been necessary to give the choicer kinds even moderately careful examination.

On the part of our conductors there was no attempt to hurry us through the exhibition; indeed, they appeared just as enthusiastic and interested as ourselves, and more particularly so when they happened to come across a variety which they had not themselves previously seen in flower. Had not the pilgrims at last cried, "Hold—enough!" they would have been carried off, wet, tired, and muddy though they were, to some distant field to inspect the remainder of the collection.

There are certain qualities about nearly all the Newtownards seedlings which are very striking—namely, the unusual substance and depth of the petals, and the freedom of flowering of the varieties. No doubt the moisture-holding soil, and the softening influence on the climate of the sea-breezes, may have been to some extent factors in emphasising these all-important qualities in any new Rose; for flimsy-petalled Roses are not suitable for this climate, and must ultimately be superseded by those which will better withstand the humid and uncertain weather of our islands. The plants, too, seemed to appreciate the favourable conditions in which they were placed, for even on the unmanured plots they presented a healthy appearance, and had made good growth. No greenfly was anywhere visible, and not a spot of mildew—two pests which this year have worried so many rosarians in the Southern and Midland counties of England.

With such a large number of beautiful varieties, seen for the first time, it was extremely difficult to pick out the real gems. It was like a connoisseur tasting different choice vintages of some particular wine, for we became at last so bewildered that it would have been impossible to decide off-hand on which varieties our choice would have fallen had we been asked to select the best dozen sorts, or even the best twenty-four, where the standard throughout was so high.

The firm, after years of careful cross-breeding and selection, have now obtained a distinct strain of pedigree Roses of their own, which they are crossing with well-known types of existing varieties with the most promising results. The strain consists principally of hybrid Teas, with here and there pure Teas, bearing larger flowers and of more vigorous growth than is usually met with in that section.

One member of our party, a professional grower and himself the raiser of many choice Roses, who had not visited the Newtownards nurseries for several years, expressed himself as much impressed with the

clear advance in general quality of the seedlings that had taken place even during that period.

Coming now from generalities to particulars, and taking in the first instance the creamy, lemon, and blush-whites, there were several which may be best described as improved Kaiserin Augusta Victoria, like the beautiful lemon-white Mrs. David McKee, which received the Gold Medal of the National Rose Society at the Glasgow exhibition the day before—varieties of stiff upright habit, with conical flowers with high centres.

Other fine sorts are Duchess of Westminster (salmon-white), and Countess Annesley (rosy-cream). The pink and pale rose-coloured varieties, as is usual with seedling Roses, are more numerous than any others. Of these may be mentioned Lady Ina Bingham, easily distinguished by its bold foliage. This is a semi-double garden variety with grand guard petals of a pure rose-pink colour, like Camoens. Dr. Campbell Hall, named after the amateur Rose champion of Ireland, is a fine silvery-pink variety with a deeper centre, and is, we understand, to be distributed next year. The largest blooms that came under our notice were about the size of Her Majesty, with the character of Caroline Testout. The large deep pink flowers and bold habit of this Rose at once commanded attention. Lady Ashtown is also a distinct and fine deep pink variety.

In turning to the yellows we could not but feel how much these are still wanted among exhibition Roses, and how greatly any stand is lighted up as it were and improved by their insertion. There were several lemon-yellow varieties which delayed the footsteps of the pilgrims for some time. One was like Medea at its best—in fact, an improved and more certain Medea, and with more upright growth. Then another gem was after the style of Madame Hoste, but stronger and finer than that variety. The colour is unique, shading as it does from lemon-yellow to deep bright-yellow halfway down the petals. Shortly afterwards we came across a lovely button-hole Rose, pure self-coloured orange, like William Allen Richardson; and another orange, tinged red, like Lady Penzance. There are also varieties of other shades of yellow, ranging from creamy-yellow to rich orange. Some of these varieties, should the raisers decide on sending them out, will, I feel sure, be warmly welcomed as decided acquisitions by all classes of Rose-growers.

Among other seedlings of various colours which arrested our attention may be mentioned in fortuitous order the following:—Dean Hole, a fine hybrid Tea, with the colour of Maman Cochet, and like that variety it has an excellent habit of growth. Then early in the day we spent several minutes examining a new Tea Rose, which may be best described as a strong-growing Souvenir d'Elise Vardon. Mention must also be made of another Tea with flowers after the style of Cleopatra, but of upright bushy growth. One of the most distinct Roses that came under our notice was somewhat after the character of Mrs. W. J. Grant, but fuller, and in colour like Marquise Litta. Here and there were one or two promising crimsons, and among them that very attractive variety, C. J. Grahame; but

unfortunately at the time of our visit few of the dark Roses were as yet in flower.

What is likely to prove one of the most generally popular varieties of the whole series is a Rose which would form an admirable companion to Killarney, being of the same type of flower and habit, but in colour a pale rosy-copper. The christening of this variety by the pilgrims, with our genial chaplain as chairman, formed one of the most picturesque incidents of our visit. After many names had been discussed it was suggested, with the approval of the raisers,

at Manchester will ever forget it. Indeed, I need scarcely say that on that occasion the Gold Medal of the National Rose Society was without a moment's hesitation unani- mously awarded it. For who could have any doubt of its merit after seeing such a display of perfect Caroline Testout-like flowers? It reminded me of the long line of boxes of Her Majesty shown for the National Rose Society's Gold Medal by the late Mr. Bennett at South Kensington in 1883.

Now that Roses are being so largely used

gratefully acknowledge, and only hope that our chaplain will not forget, when compiling his next list of Irish characteristics, to give a prominent place in it to "Irish hospi- tality," of which we experienced at New- townards so striking an example.

As an indication of the sterling novelties that rosarians may expect from the nurseries at Newtownards in the future, and of the leading position Messrs. A. Dickson & Sons have already obtained, I append the follow- ing particulars of varieties sent out from those nurseries which are now in general cultivation.

On reference to the National Rose So- ciety's *Official Catalogue of Exhibition and Garden Roses*, I find that out of the thirty- three exhibition varieties included in it which are ten or fewer years old, that as many as eighteen, or more than half that number, were raised at Newtownards. Then in my analysis of the exhibition Roses most frequently staged in the prize stands at the last eight metropolitan exhibitions of the National Rose Society, and which appeared in the *Journal of Horticulture* in October last, Messrs. A. Dickson & Sons will be seen to be again to the fore. In the table of Hybrid Perpetuals and Hybrid Teas, Bessie Brown heads the list; and Mrs. W. J. Grant and Mrs. R. G. Sharman Craw- ford occupy the fifth and sixth positions; while Mrs. Edward Mawley stands No. 5 in the table of Teas and Noisettes.

Enough has, I think, been said to give at least some idea of the surprising extent and beauty of the new Roses that are being raised at the Royal Nurseries at New- townards. I can only say on behalf of those of our party who had not visited these nurseries before, that we felt, like the Queen of Sheba after visiting King Solomon, that the half had not been told us. *Edward Mawley.*

NEW OR NOTEWORTHY PLANTS.

CROSSOSOMA CALIFORNICUM.*

To Mr. Gumbleton must be attributed the credit of being the first to flower this interesting shrub in Europe. Both in the leaves and the flower before us there is a superficial resem- blance to *Carpenteria*. The glabrous leaves are lanceolate, entire, about $2\frac{1}{2}$ inches long by $\frac{1}{2}$ inch broad, tapering to a very short stalk. The flowers are solitary, on long, slender stalks, about $\frac{1}{2}$ inch in diameter, with five spoon-shaped reflexed sepals, and as many rounded, white, shortly- stalked petals. Stamens numerous, perigynous, yellow, carpels five or six, free, distinct. Probably the flowers will eventually be larger than the one now sent by courtesy of Mr. Gumbleton.

This is one of several curious plants or varieties confined so far as known to the islets off the Californian coast, and probably on the high-road to extinction, if not preserved in the gardens of the curious. It is placed among the Ranuncu- laceæ, but the perigynous stamens attached to the edge of the short flower-tube, suggest Saxi- frages rather than Ranunculus. Engler makes it the type of a new natural order near Rosaceæ (*Naturl. Pflanzen famil. Nachtrage*, p. 185, 1900).—*M. T. M.*

* *Crossosoma californicum*, Nuttall ex Brewer & Wat- son, in *Botany of California*, vol. 1., ed. 2, p. 13 (1880) (ed. 1, 1876).—"A stout diffuse shrub 4 feet high, with whitish wood, and grey bitter bark; leaves oblong, 1 to 3 inches long, attenuate [tapering] to a very short petiole; flowers large, on long stout peduncles; petals orbicular, 6-9 lines long; carpels oblong, 8-12 lines long, 20-25 seeded; seeds over a line in diameter, with a shining crustaceous testa, covered with the brown fringe of the arillus." Catalini island, Guadeloupe island.

FIG. 50.—*CROSSOSOMA CALIFORNICUM*, CALIFORNIAN SHRUB, FROM THE GARDEN OF W. E. GUMBLETON, ESQ.

The isolated flower shows the funnel-shaped calyx tube, the spoon-shaped sepals, &c. Flowers white, produced for the first time in Europe.

to name it "Betty," after a charming little grand-daughter of our host. Ultimately the name was changed to "Lady Betty." The pilgrims were also permitted to name a Rose after Lady Helen Vincent, who so graciously performed the opening ceremony at the National Rose Society's exhibition at Exeter last year. In accordance with her Ladyship's request a variety was selected somewhat after the colour of Mrs. Edward Mawley.

In one part of the nursery were noticed fine rows of Bessie Brown and Mildred Grant, also of Edith D'Ombraïn (a pink variety of dwarf but very sturdy growth) and of Florence Pemberton. Few who saw the huge bowl of Florence Pemberton submitted to the judges of new seedling Roses last year

for garden decoration, the greatest want in the Rose-world is a race of hardy, perpetual-flowering, climbing, or rambling Roses. This want I was pleased to see the firm at Newtownards were endeavouring to meet. To raise any number of varieties combining the necessary vigour, hardiness, and freedom of flowering, must necessarily be a work of time; but the brothers Dickson have overcome so many difficulties in the past that there can be no room for doubt but that they will ultimately succeed in giving us at no distant date the type of climbing Rose required.

The warm reception accorded to us by the Dickson family on the occasion of our delightful visit we pilgrims one and all

ANGRÆCUM ROTHSCHILDIANUM, *n. sp.*
(see fig. 51).

A fine plant from the little-known country of Uganda, in the direction of the Victoria Nyanza. It flowered with the Hon. Walter Rothschild, and was awarded a Botanical Certificate at the Royal Horticultural Society held on August 4 last. The species belongs to a section never introduced into gardens, and the only other representative of which is *Angræcum Galeandæ*, Rehb. f. in *Flora*, 1865, p. 189, and which is enumerated in *Flora of Tropical Africa*, 7, p. 136.

A. Galeandæ was recorded from Lower Guinea and Angola (Welwitsch), and there is good material of it in the Kew Herbarium. Its leaves are narrowly cuneate and unequally bilobed, and the plant is very different from *A. Rothschildianum*. The flowers are allied. There is no record of colour in *A. Galeandæ*, although it is a very striking feature in *A. Rothschildianum*, and could not fail to be remarked on in any similar species if it existed.

A. Rothschildianum.—Habit of growth similar to that of *A. bilobum*; stem 3 to 6 inches high, leaves ovate, unequally bilobed, rarely cleft at the apex, the longer lobe being simply continued beyond the shorter one, very dark-green, 4 to 8 inches long, 3 inches broad; scape deflexed or pendulous (as much as 1 foot long, and bearing twelve flowers on the old imported spikes), four-flowered on the plant described. Bracts small, triangular, and closely clipping the stem. Pedicels $\frac{1}{2}$ -inch long. Flowers closely and alternately arranged, very fragrant, white with a pale green band up the middle of the sepals and petals; a rich emerald-green disc and blackish-purple base to the lip. Sepals lanceolate, apiculate, 1-inch long petals slightly broader and shorter. Lip and spur $1\frac{3}{4}$ inch long, the broad wavy edged ovate front, pure white on the margin, rich emerald green in the centre, and blackish-purple in the funnel of the spur, the tip of which $\frac{1}{2}$ -inch in length is enlarged, laterally compressed, and recurved abruptly; spur brownish at the point, green on the broader middle portion. This charming plant is one of the discoveries of Major H. B. Rattray, of the King's African Rifles, when on one of his expeditions into new country. The delays of transit and the heat of the Red Sea, however, nearly destroyed these and other fine species sent at various times. *James O'Brien*.

MESEMBRYANTHEMUM MIRABILE,
N. E. Brown (n. sp.).

This is a pretty dwarf tufted species, with white flowers, belonging to the group with a tuft of bristles at the tips of their leaves. It was sent to Kew (where it flowered this June) from the Cape Town Botanic Gardens, but its precise habitat is unknown to me. The leaf surface, as seen under a lens, is extraordinary, and produces a feeling of surprise when first seen, the glittering papillæ which cover it being quite unlike those of any other species I have seen; their beauty must be seen to be understood, for they cannot be adequately described. As introduced, the plant is about 1 inch high, densely tufted, with densely-crowded leaves 2—6 lines long, $1\frac{1}{4}$ — $1\frac{1}{2}$ line thick. Under cultivation it has become 2—3 inches high, with stems 1— $2\frac{1}{2}$ inches long, $1\frac{1}{2}$ —2 lines thick, having internodes $\frac{1}{4}$ — $\frac{3}{4}$ inch long, hispid with white hairs, which are spurred at the base. Leaves opposite, shortly connate at the base, often with small tufts of leaves in their axils, spreading, 6—13 lines long, 2—3 lines broad, $1\frac{3}{4}$ — $2\frac{1}{2}$ lines thick, sub-cylindric, flattened on the upper side, bright green, densely covered with somewhat glittering papillæ, which are subrhomboid, with a short acute point at each end, one point directed to the apex, the other to the base of the leaf, whose obtuse apex is tipped with a tuft of 12—14 (8—12 in the introduced plant), dark-brown rigid bristles, $\frac{1}{2}$ —1

line long, the outer of which are acutely spurred at the base. Flowers quite sessile between the terminal pair of leaves. Calyx 6-lobed; tube 2 lines long, $3\frac{1}{2}$ lines in diameter, very broadly obconic, shortly hispid with ascending spurred hairs; lobes unequal, erect; two about 7 lines long, the other four about 5 lines long, all resembling the leaves, slightly gibbous at the base, tipped with a tuft of brown bristles, the four shorter lobes having membranous margins. Corolla pure white; petals 10 lines long, $1\frac{1}{4}$ line broad, 2—3-seriate, rather lax, oblanceolate-linear, obtusely pointed, entire. Staminodes $3\frac{1}{2}$ —4 lines long, filiform-subulate, very acute, erect, slightly spreading at the tips, about $1\frac{1}{2}$ line longer than the collected stamens, which they closely invest; staminal filaments white, with a tuft of hairs at their base; anthers yellow. *N. E. Brown*.

obtained for worse blotched *Odontoglossums* than "apiatum."

The *Odontoglossum*-houses have their occupants in splendid condition. Among the priceless blotched forms of *O. crispum* noted were *O. c. Baroness Schroder* and *O. c. Ballantinei*, two of the most beautiful; *O. c. Sanderianum*, *O. c. Princess Christian*, *O. c. Rex*, *O. c. Nobilior*, *O. c. Starlight*, *O. c. xanthotes*, and *O. c. grande maculatum*, all superb things which have received First-class Certificates, *O. Pescatorei* and *Veitchii* and some of the others having been in the collection over twenty years. Most of them have been illustrated in the *Gardeners' Chronicle*.

In the main *Odontoglossum*-house a few are still in bloom, including the singular-looking *Oncidium insculptum*. Planted beneath the staging, with other foliage plants, are numbers of Sanders' *Begonia Rex* varieties, and which have produced

FIG. 51.—ANGRÆCUM ROTHSCHILDIANUM.

ORCHIDS AT THE DELL, EGHAM.

LIKE the sincere lover of plants that he is, Baron Sir H. Schroder still retains the keen interest in his famous collection of Orchids for which his garden is noted, and his interest in his plants individually is most pleasantly displayed when, for the information of the visitor, he points out some of the rarer specimens and relates interesting points in their history, or of peculiarities under cultivation. Thus we were introduced to the famous purple-blotched *Odontoglossum Pescatorei Schroderiana* and *O. Pescatorei Veitchiana*, both still far ahead of any of the numerous recent introductions, and both have been propagated, though very slowly, and do not now rely solely on the originals. Next came the extraordinary *O. crispum apiatum*, for which the Baron paid something less than £200 at Messrs. Protheroe & Morris' sale-rooms, and which was supposed to have been the record price. So wild was the purchase supposed to have been that the Baron excused his rashness on the plea that the plant had much taken his fancy. Since that thousands of pounds are asked and, it is said,

enormous leaves of the most beautiful and varied colours.

In the little warm-house adjoining, the Pitcher-plants suspended over the tank are in great beauty; the *Anthuriums*, *Vanda tores*, *Macodes petola*, and other occupants, also good.

The large *Cattleya* and *Lælia* house until recently had a fine display of large-flowered *Cattleyas*. At present the *C. Gaskelliana* form the chief in flower, a few hybrids being also in bloom, as well as the pretty, rare, and botanically interesting *Cattleya Schroderiana*, of which the one in flower now is of the original stock. The new *Cattleya* × *Shakespeare* (*Rex* × *granulosa Dubuyssoniana*) is a great beauty, the specimen having three spikes with thirteen flowers, the sepals and petals of which are cream-white, the front of the labellum purple. *Lælia*-*Cattleya* × *bletchleyensis Illuminator* is a grandly coloured hybrid; *L.-C.* × *Queen Alexandra*, and *Lælia* × *purpurato-Dighyana Edward VII.*, two fine things with which our readers will be conversant, as they formed the supplementary coloured illustrations of our issue of June 21, 1902; *L.-C.* ×

Bella, one of the earlier hybrids and still one of the best, and some others are also in bloom.

In the smaller cool-houses some of the *Odontoglossums* are in bloom. Also *Nanodes Medusa*, *Ornithidium coccineum*, *Cochlioda vulcanica*, *C. Noezliana*, and a few brightly-coloured *Masdevallias*.

A warmer house has one side filled with *Miltonia vexillaria*, *M. v. superba* and others being in flower, as well as the rare and little-known, fragrant *Miltonia Schroderiana*, and a number of *Oncidiums*. Beyond is a house of *Cymbidiums*, in which also are several strong plants of the fine white *Mormodes luxatum eburneum*, and some other rare species.

A smaller *Cattleya*-house contains some of the finest forms of *Cattleyas*, including *C. Trianae Schroderiana*, *C. T. Russeliana*, *C. T. Osmani*, and other of the old favourites which have never yet been deposited. Also a collection of *Sophranitis* crosses, including the fine *Sophr - Cattleya* × *Queen-Empress*, *S.-C. × Calypso*, and *S.-C. × Batemaniana*, the last-named being the plant which received a First-class Certificate in 1887.

The large warm-house, in the centre of which specimens of *Anthuriums*, *Alocasias*, &c., are arranged, has the warm-house *Cypripediums* on the side stages, and rare *Dendrobiums*, &c., suspended from the roof. Among the former in flower are three noble specimens of *Cypripedium* × *Lord Derby*, *C. × Massaianum*, and some other showy hybrids. Others remarkable for their vigour and beauty of foliage were *C. Stonei platyanium*, *C. × Antigone*, *C. × Jas. H. Veitch*, and *C. × Baron Schroder*. *Dendrobium* × *Rhodostoma*, as usual, bears its white and claret flowers; *D. superbum Dearei*, *D. s. Burkei*, and *D. s. Huttoni*, the albinos of the species commonly known in gardens as *D. macrophyllum*, are in fine health; the fine forms of *Cattleya Lawrenceana*, including *C. L. Hyeana*, *C. L. Vincke*, and *C. L. concolor*, all thriving; and among the most interesting subjects the original plant, now divided into two, of that singular cross between *C. citrina* and *C. intermedia*, known as *C. × Lamberhurst* hybrid, and which obtained a First-class Certificate in 1888. Like many other wide crosses it is stubborn at times, but Mr. Ballantine, the gardener at The Dell, and his able assistant, Mr. Clarke, have hitherto been able to tide it over the periodical fits of waywardness, as they have done with many other refractories. In this warm-house the suspended baskets of the pale-blue *Utricularia Endresi*, and the white and yellow *U. montana* give a profusion of flowers which arrange well with the Orchids.

The *Phalænopsis*, which in time past have given much trouble at The Dell, seem to have at last settled down comfortably, and have made promising growths. The *Vandas* and *Aerides* houses have their occupants in satisfactory condition, among the good specimens of the former being *V. insignis Schroderiana*, the unique albino; and *V. Dearei*, also confined to The Dell collection; and among the latter the pure white *Aerides Fieldingii album* (*A. Williamsii*).

The deciduous *Dendrobiums* and hybrids are suspended from the roof of a large span-roofed warm-house, the central bed of which is filled with beautiful-leafed *Caladiums*. Round the sides are the *Calanthes*, the noble hybrid *C. × Baron Schroder*, raised at The Dell, being by far the finest, and also a remarkably strong grower.

One house, in which the small decorative plants of *Codiaeums* and other "table plants" are excellently well grown, has a fine batch of *Dendrobium formosum giganteum* suspended in it. Another house has a fine collection of *Gladioli*, a bright dark-blue one being very effective. A cold-house has a fine display of *Lilies* and *Crasulas*, and throughout all the numerous others, in

which are fruits and flowers, the utmost neatness and order prevail.

OUT-OF-DOORS.

In a long range of frames the large number of scarlet *Nerine Fothergilli major* are showing flower, and in the beds and borders *Gladioli*, *Phloxes*, and other showy perennials and herbaceous and Alpine plants make a fine and varied display. The many fine trees and Conifers with which the grounds are so skilfully planted seem to be all the better for the wet and rather cool summer, about which so many gardeners complain.

ORCHID NOTES AND GLEANINGS.

LÆLIO - CATTLEYA × NOEL (L. - C. × SCHILLERIANA STELZNERIANA × C. GRANULOSA SCHOFIELDIANA).

This pretty hybrid, raised by Mr. Thos. Stafford, gr. to Fred Hardy Esq., Tyntesfield, Ashton-on-Mersey, is now flowering in the gardens there, and, as is the case with most of the *C. granulosa* crosses, the features of the plant and flowers partake most nearly of that species, the labellum, with its deeply-cleft, elongated side lobes and roundish, fringed-edged front lobe extended on a narrow isthmus, being especially suggestive of *C. granulosa*. The flower is nearly 6 inches across. Sepals and petals creamy-white, with an obscure tracery of lilac. Lip bright violet-purple, the base showing the white-ground colour between the veining, and the front lobe a narrow lavender-coloured margin.

ODONTOGLOSSUM CRISPUM AT TWICKENHAM.

This season the quantities of *Odontoglossum crispum* imported seem to indicate that it may be a rival of *Lilium auratum*, astonishing quantities of which are imported and sold every year. In Mr. H. A. Tracy's nursery, Amyand Park Road, Twickenham, a goodly number of established plants of *O. crispum* are in flower, most of them consisting of the good round-flowered type, and some few of the favourite spotted class. A large consignment of fresh imported *O. crispum* from the Pacho district has also recently arrived.

In the Orchid houses both hybrids and species are well represented, in bloom being five very fine forms of *Lælio-Cattleya* × *elegans*, a very handsome *L.-C. × Atalanta*, good *L.-C. × Schilleriana*, &c. Among the *Cattleyas* in flower is a good selection of *C. Gaskelliana* and a few *C. Trianae* of a fine type flowering out of season from a fresh importation. *Cypripedium* × *Thyades* (*superbiens* × *Chamberlainianum*) and many other hybrid *Cypripediums* are also in bloom.

ALPINE GARDEN.

SCHIZOCODON SOLDANELLOIDES.

This pleasing Alpine Japanese plant has been imported in numbers quite disproportionate to the measure of success—or rather failure—which has attended its cultivation in this country. It does not appear to travel well, and many of the imported plants soon succumb after arrival, even if they look promising when first planted. This is unfortunate, as there is a charm about this plant, with its deep, almost chocolate-coloured leaves, which assume different hues, however, at various seasons. This charm is heightened when the delicate, small, fringed pink flowers rise above its foliage in spring. The whole plant is very dwarf, and it is thus one of the plants which delight even the most fastidious lover of Alpine flowers, and deserves every effort to induce it to flourish. One ought not, therefore, to feel disheartened or discouraged if the first, second, or even third attempt to grow it results in failure. My own first plant, care-

fully tended as it was, had lingered long ere it succumbed, and it was not until I had seen it established and happy-looking in the garden of the late Mr. George F. Wilson at Oakwood that one realised its beauty and the best kinds of conditions for its cultivation. At Oakwood it was partially, almost entirely indeed, shaded by shrubs and grew in a peaty soil.

Every garden has not the conditions that were afforded at Oakwood; but after some experiments success was attained here in a simple way. A spot was chosen on an upper terrace of a rockery, where it is shaded and sheltered from the west and north-west by a bush of *Berberis buxifolia nana*, in such a way that, with the shade of other shrubs and plants at the top of the rockery, the *Schizocodon* receives practically only a little sun in the morning. The exact exposure may be said to be north-east, but it is sheltered by other rockeries from cutting winds. For the purpose of suiting its requirements a compost was made up consisting of about equal parts of gritty sea-sand, which had been well washed by rains, and a material I use instead of turfy-peat, which is washed up occasionally by the sea and which apparently consists of the fibrous matter from peat-bogs, decayed leaves, and small pieces of sea-weed, all reduced to small particles. This makes a good material for use in many ways in the garden, as it practically serves for peat, and can be used in a similar way to *Coccafibre* for most of the purposes to which that useful substance is applied. The sand and this were mixed together, the plant turned out of its pot, the whole made as firm as the material would allow, and a generous application of water completed the process. For a few days a flower-pot was placed over the plant, and only removed in rainy weather, until the plant seemed reconciled to its new quarters, when the pot was removed. Since then all that it has received have been occasional top-dressings with the same material and frequent liberal supplies of water during the summer, so that the soil never becomes dry. Thus treated it has grown well and has flowered for three or four seasons. These details may seem rather prolix, but the *Schizocodon* is one of the plants which requires and deserves the best care of the cultivator. Further experiments have convinced me that those who have not such material as I have can grow it successfully in turfy peat broken small, decayed leaf-soil, and sand, in about equal proportions, while the addition of a little *coccafibre* will be found useful, though not absolutely necessary. *S. Arnott, Carsethorn-by-Dumfries, N.B.*

PHYLLOCACTUS STRICTUS, LEM.

This species is certainly not very pretty, but it is a rather rare plant, and as one of the night-flowering Cacti, well deserves the attention of all lovers of Succulents. Two years ago I brought a little piece of it from a garden in the South of France, where the plant was cultivated without a name, and had never flowered. It is remarkable for the horny borders along the linear-lanceolate and crenate branches, which are only found in a few *Phyllocacti*. This year I had the pleasure to see its flower. The bud was extremely slender and of a very curious aspect. It continued to grow to a length of 9 inches, not being thicker than about 2—3 lines in the centre; the sepals were short and not numerous. The flower only opened late at night, and had faded by the next morning. The sepals were recurved, brownish-white, and the petals pure white. The whole flower had a diameter of little more than 3 inches. The style is longer than the radiating stamina, rose-coloured above, with 10—12 yellowish-white stigmata. *Phyllocactus strictus* is said by Lemaire, the author of the species, to be a native of Cuba. *Alwyn Berger, La Mortola.*

CALOCHORTUS PULCHELLUS,

DOUGLAS.

We are glad to have the opportunity, thanks to the courtesy of Messrs. Wallace, of illustrating a plant which was exhibited by them at a recent meeting of the Royal Horticultural Society (see fig. 52). In the opinion of Mr. Carl Purdy, whose experience entitles him to the greatest consideration, the plant known in gardens as *C. pulchellus*, and figured under that name in the *Botanical Magazine*, t. 6527, and in the *Botanical Register*, 1662, has no right to that appellation, but should be called *C. amabilis*, Purdy. The true *C. pulchellus*, according to Purdy, as here figured, is of more robust habit, with larger flowers and a different shade of yellow.

In the first number of *Flora and Silva*, p. 24, Mr. Carl Purdy says of this species: "The true *pulchellus* was one of the first discovered, as it was collected by Douglas, sent to England, and described and figured in 1835. Later it was lost sight of, and its very name appropriated by *C. amabilis*. It has been reintroduced during the last few years as *C. pulchellus*, Douglas, from Mount Diablo, California. The flowers are the largest of any of the Globe Tulips, and finely globular. The petals are exquisitely fringed with short, stiff hairs."

Mr. Purdy has overlooked the figure of *Cyclobothra pulchella* given in the *Gardeners' Chronicle*, June 16, 1883, p. 765, fig. 127, from a drawing by Mr. Worthington Smith. This affords an illustration of the inconvenience that arises from the multiplication of synonyms. Not finding the plant mentioned in our columns under the head of *Calochortus*, we not unnaturally thought that Messrs. Wallace's plant had not been figured; but a comparison of the figure published in 1883 with that now issued will show that they represent the same species. We may add that Mr. Worthington Smith, at p. 768 of the volume for 1883, gives an interesting account of the way in which large insects are precluded from entering the pouches on the petals, whilst the smaller ones enter and cannot escape.

"*C. amabilis*," continues Mr. Purdy, "was until this year known as *C. pulchellus*. It differs in having much smaller flowers of quite another shape, and a much deeper yellow." Probably by inadvertence, and in spite of his expressed opinion to the contrary, Mr. Purdy, in his monograph in the *Proceedings of the California Academy*, includes the names of Bentham's plant and of that figured by Lindley as synonymous with his *Calochortus pulchellus*, when, properly speaking, those names should have been transferred to his *Calochortus amabilis*.

Mr. Purdy does not give the reference to the original description by Mr. Bentham, which we now supply: *Cyclobothra pulchella*, Bentham, in *Trans. Hort. Soc. London*, n.s., vol. i., p. 412, t. 14, f. 1. Bentham, it will be there seen, quoted Douglas's MSS. name of *Calochortus pulchellus*, but preferred to class the plant under *Cyclobothra*. Nowadays, the two genera are considered to "slide into" one another, and our present plant is accordingly placed under *Calochortus*.

But these permutations of nomenclature, tiresome as they are, are not the only difficulties to be contended with; there are other perplexities to be unravelled. In order to clear them up so far as we could, we compared Douglas's original specimens in the Kew herbarium with Messrs. Wallace's plant and with the three coloured plates above referred to. Now surely, we thought, we shall be going back to first principles and be able to settle the matter at once. But we had not gone far in our task before we found it necessary to formulate an opinion as to what were first principles! We do not know whether Mr. Purdy has ever seen

Douglas's specimens. If he has, or if anyone else for that matter has done so, the opinion arrived at may, it is possible, be different from our own. This difference arises from the doubt that may be entertained as to whether we should take Douglas's actual specimens as the starting-point,

or whether, as Douglas himself never published a description of his plant, the manuscript name he applied provisionally should be accepted or treated as a *nomen nudum*, as botanists say. That matter could easily be settled as we thought; we had but to take into consideration the figures

FIG. 52.—CALOCHORTUS PULCHELLUS.

and descriptions published first by Bentham, then by Dr. (afterwards Sir William) Hooker, and then by Lindley. Well, let us see how that works out.

In the first place, there are Douglas's specimens in the Kew herbarium—unsatisfactory ones, it must be added. We do not know the date or the exact locality where these were collected. In any case they belong, in our opinion, to the large-flowered form, such as that lately shown by Messrs. Wallace, and figured by us in the *Gardeners' Chronicle*, 1883, fig. 127, p. 768.

Secondly, we have the coloured figure and description given by Bentham of *Cyclobothra pulchella* in the *Transactions of the Horticultural Society*, published in 1835, with the information that it represents "*Calochortus pulchellus*, Douglas MSS." On comparing this figure with Douglas's specimens it is at once seen that the figure does not represent the same species as the actual specimens. The illustration represents more nearly the smaller-flowered species which till lately we have been accustomed to call *pulchellus*, and which is now referred to *C. amabilis*, Purdy.

The same remark applies to the plates subsequently published by Hooker and by Lindley.

How are we to reconcile the discrepancy? As a means of doing so we suggest that Douglas's herbarium specimens may antedate by some years the plants raised at Chiswick. Bentham, in his paper in the *Transactions of the Horticultural Society*, read on January 21, 1834, expressly says: "Report on some of the more remarkable hardy ornamental plants raised in the Horticultural Society's garden from seeds received from Mr. David Douglas in the years 1831, 1832, and 1833.

Bentham's description and figure therefore were taken from a cultivated plant, and so were those of Hooker and Lindley. That being so, then either the seeds must have been grown under a wrong name, or the plant is very variable.

The latter alternative is, of course, quite possible; but having seen the two cultivated plants in a living state, as well as dried and figured, we can but come to the conclusion, as a matter of opinion, that the two plants do actually represent two distinct species. As Purdy is the latest monographer of the genus and well acquainted with the species both in a wild and in a cultivated state, we of course accept his decision on that point. Then arises the nomenclature difficulty before referred to. We propose to meet that by following the Kew usage, and adopting the name given by him who has put the plant in the right genus.

Worked out on this basis, the nomenclature and synonymy come out as follows:—

CALOCHORTUS PULCHELLUS, Douglas MSS. and in the Kew herbarium. Wood, *Proceedings Philadelphia Academy* (1868), p. 168 excl. syn.; Baker, *Journal Linnean Society* (1875), p. 303, excl. syn.; Watson, in *Botany of California*, ii. (1880), p. 172; Jepson, *Flora of Western Middle California* (1901), p. 113; Purdy, in *Proceedings California Academy of Science* (1901), p. 118; *Garden and in Flora and Silva*, i. (1903), excl. syn.

SYNONYM. — *Cyclobothra pulchella*, *Gardeners' Chronicle*, 1883, p. 768, fig. 127.

CALOCHORTUS AMABILIS, Purdy, in *Proceedings of California Academy of Science* (1901), p. 118.

SYNONYMS. — *Cyclobothra pulchella*, Bentham, supra cit.; Hook in *Botanical Magazine*, 6527; Lindley, *Botanical Register*, 1662.

Calochortus pulchellus, var. *amabilis*, Jepson, *Flora of Western Middle California* (1901), p. 113.

? *Calochortus pulchellus*, var. *B. parviflorus*, *Garten Flora*.

All this detail will be as irksome to the reader as it was troublesome to us to unravel. It is of more consequence to the grower to know that the larger form (*C. pulchellus*) is better worth cultivating than the smaller one now called *amabilis*, although the connoisseur will not willingly be without the two. In addition to differences in size, habit, number, and colour of flowers, the form of the sepals is usually different, being much more gradually tapering in the true *pulchella* than in *amabilis*. The presence or absence of fine threads or hairs on the inner surface of the petals, which has been relied on as a distinguishing character, we find to be untrustworthy. Hairs are found sometimes, whilst at others they are absent from flowers of the same species. M. T. M.

THE ROSARY.

ROSE ZEPHYRINE DRUOT.

A CONTRIBUTION to the history of this Rose is given in our last issue, p. 122, as a supplement to what had been previously recorded. We have still, however, to learn the original source of the Rose, and still to know how to spell its name, for each of our correspondents spells it differently, and we can find no authoritative standard to which to refer it.

It is to the late Mr. Selve Leonard, as it appears, that we are indebted for the introduction of this very desirable Rose. It is not an exhibition Rose, but as a garden or a pillar Rose it has many excellent qualities. It is thornless, it flowers throughout the summer, it is a free bloomer, of a rich rose colour, and deliciously fragrant. The young wood is green and shining, devoid of prickles or hairs. The stipules are adnate for three-fourths of their length, the free portions are linear-lanceolate, with stalked, glandular hairs. The rachis or midrib is slender, deep red, with a very few small scattered prickles, intermixed with a small number of glandular hairs. The leaflets are in one or two pairs, with a solitary terminal leaflet larger than the rest; all are glabrous on both surfaces, oblong-lanceolate, rounded at the base, serrated, deep green above, paler beneath. The buds are conical, receptacle top-shaped, glabrous; sepals oblong-lanceolate, slightly hairy, especially on the inner surface, inner ones entire, outer slightly lacinate, all ultimately reflexed; expanded flower nearly 3 inches across, petals roundish, obovate, recurved at the margins, yellowish at the extreme base, elsewhere deep rose-pink; styles free, carpels very hairy.

We feel that an apology is due for introducing such technical details when in presence of so lovely a Rose, but as it is desirable to be able to recognise it and distinguish it from others, we hope rosarians will not judge us harshly, but in any case feel gratified that their attention has been drawn to so beautiful a flower.

THE THORNLESS ROSE.

There is a Rose here which for years has been pointed out to visitors as "the Rose without a thorn." It is growing as a bush, and has been in the garden for about forty years so far as I can tell. Its thornless nature is not absolute, for though the slender stems are as a rule destitute of thorns, at any rate of strong ones, the leaves constantly bear a few small prickles on the lower side of the midrib (rachis). Suckers and strong shoots often have stiff spines. The calyx, receptacle, and stalk below are thickly covered with glandular hairs or bristles, some of which may even be spinous. Thus, though the thornless character is not invariable, yet the bush can usually be handled with impunity. The flowers are small, slightly scented, and pink in colour with occasional streaks or splashes of a deeper shade; they are pretty in the bud stage. The Rose

is in bloom now, but would no doubt have been so earlier if the season had been more favourable; besides it is growing in a rather sunless aspect. Then vegetation generally is a week or two later here in the north than in the south of England.

This note is sent with the thought that this variety may be the "Thornless Zephyrin Drouhin," shortly described by Mr. W. C. Leach in your issues of July 25, p. 56, and August 3, p. 103. Enclosed along with it are examples of the flower as well as some of the foliage and pieces of the stem [quite different.] J. P. Blaithe, *Carlisle*, August 12.

[The rose sent is a double-flowered form of *Rosa carolina*, or some very closely allied species. It is a native of the middle and eastern states of N. America, and is very variable. Ed.]

ROSE FRAU KARL DEUSCHKI.

M. Paul Lorenz, writing in the *Deutsche Gärtner Zeitung*, protests against the name of this Rose, which, according to him, should be called "Schnee-königin" (Snow Queen), which name has prior rights. The Rose was raised by Peter Lambert, and under whatever name it be known, it is one of the fairest of the fair.

CHINA ROSES, LATE ROSES, &c.

Admirers of China Roses, properly known as *Rosa indica*, of which so many of the common Monthly and a variety known as *Hermosa* have been planted in recent years, would do well to plant Madame Eugene Resal, a distinct and beautiful variety, eminently pleasing to those who care for Roses apart from their merits as objects for exhibition. It is quite probable that some hardened exhibitors would regard this variety with indifference. Still, it is a pretty flower, with its combined shades of coppery-red and yellow. Moreover, the plant is free-blooming and a vigorous grower.

Advice is frequently given to intending planters to place their Roses in beds or blocks in separate varieties; and very good advice it is, especially when a large number can thus be massed. I recently saw a departure from this method, which, as a contrast, was very effective. A number of plants of that lovely H.T. Caroline Testout had been planted and mingled with a like number of the crimson H.P. Victor Hugo, and as both varieties had prospered, it was difficult to know which was most deserving of admiration; in any case, the effect produced was very fine during the period when the blooms were at their best.

Viscountess Folkestone stands charged of being a rose that opens quickly and is soon over. There is some truth in this; but what a fine late-flowering variety it is! True, the autumnal rains and winds soon tear its large thin petals to pieces, but where soil and situation are suitable it blooms for a considerable length of time, and there is always the possibility of obtaining a few good flowers. The climbing Noisette Alister Stella Gray once made a bold bid for popularity, but it is by no means a general favourite. Yet the yellow flowers, though small, are very pretty and fragrant. Of this variety I have been able to gather many late clusters in former years.

Those who have not grown Madame Isaac Periere can scarcely be aware what a fine late-blooming sort is this, rivalling even the old Gloire de Dijon in this respect, its bright red flowers being produced right into November, and, in fact, until frost cuts short their career. The plant is vigorous, and useful for covering pillars and arches. I might mention many others that usually provide autumn flowers in plenty where they thrive: Anna Olivier, Souvenir de S. A. Prince (usually rather thin at the end of the season), Marie Van Houtte, Mme. Lambard (the colour of this is much poorer in autumn), and many more, but will desist.

The Rose of the year has with us been without question *La France*. We have many bushes, and some standards, and on both the blooms have been splendid and also numerous. In the wettest portion of the season some of the flowers were rendered worthless, but I have seldom seen *La France* in such grand condition. J. W.

ROSES IN JAMAICA.

Mr. H. Cousins says, in the *Journal of the Jamaica Agricultural Society*, that Hybrid Perpetuals are not worth growing in Jamaica, the results not being adequate to the trouble taken. Crimson Rambler, also, will not flower. Tea Roses and Hybrid Teas as a rule do well. The best seven are White Cochet, Pink Cochet, Kaiserin Augusta Victoria, Baldwin, Yellow Cochet, Etoile de Lyon, and *La France*. Mr. Cousins is alluding to Roses growing in a tropical climate at a low elevation. Probably on the Blue Mountains the result would be different.

ROSES WHICH FLOWER WELL IN THE AUTUMN.

Amongst autumnal Roses the following are just now specially good—W. J. Grant, Kaiserin Augusta Victoria, Lady Mary Fitzwilliam, and Caroline Testout; the polyantha Roses, crimson and other ramblers, are now at their best, including Euphrosyne and Hélène, pink; Aglaia, yellow; and Thalia, white; all of which are free and vigorous, and suitable for forming festoons, covering pillars and trellises. *Rosa rugosa* and its varieties are distinct and effective as much for their flowers and foliage as for their bright-coloured haws. Budded stocks which may have missed to take may now be rebudded, and be more likely to succeed than earlier, owing to the abundant sap-flow since the rains. The present is a good time for striking Rose cuttings, well ripened twiggy unflowered growths being selected for making them, these being taken off with a heel and pricked into pots filled with sandy loam, having a layer of clean sharp sand on the top. Keep close under hand-lights or cloches. The best place for them is a shady position facing north. In about a month the cuttings will be rooted and have begun to grow, when air should be gradually afforded as the weather permits. They will be best left undisturbed in the cutting-beds till late in the spring, when they may be potted, keeping them close till re-established. The cuttings will require protection in severe weather. J. D. G.

SEASIDE GARDENING.

(Concluded from p. 129.)

ON narrow grass-slopes, the neat but monotonous carpet-bedding is permissible, but it finds favour with but few now. If adopting it, use the rosette-formed Succulents in preference to *Alternanthera* of sorts, and never venture to plant-out the last named till the end of June, when they have been gradually hardened off. Avoid carpet-patterns, and above all things inscriptions, which are in very dubious taste. The best Succulents are *Sempervivum calcareum*, *Kleinia repens*, *Pachyphytum Browni*, *Sedum acre aureum*, *Sedum lydium* and *S. spectabile*. *Echeveria* furnishes also a very wide choice of suitable subjects; from the noble *E. metallica*, to the minute *E. secunda glauca*, and the mealy-leaved and distinct *E. pulvurelenta*, all will be found most useful, indeed indispensable.

Antirrhinums, once classed as florists' flowers, and named, have now passed from that mild tyranny, and are raised from seed almost exclusively. The Tom Thumb section originated on the Continent, and among these may now be found a large choice of dwarf and sturdy sorts, from 6 to 15 inches in height, admirably adapted for seaside bedding. These may be sown in the open borders late in August, transplanted, and finally placed in their permanent quarters in

early spring, when they will continue to grow and flower all the summer—indeed, right up to the first sharp frost. It greatly helps them if the spent flower-spikes bearing their seed vessels are removed as they form. Dwarf Antirrhinums may be had in separate and distinct colours, but are more effectual when used mixed. If raised as directed, the habit will be shown before the final planting out, so that the tallest may be chosen for the centres of the beds, and the dwarfier ones for the margins. Naturally the Antirrhinum is biennial, but if sown early in gentle heat, and planted out in May, it is practically an annual. Among really distinct and striking novelties in this flower are Brilliant, an almost scarlet form; and a pure white, called Queen Victoria, both of which come true from carefully-saved seed. The foliage of the last-named is small and abundant.

Some of the dwarf annual Toad-Flaxes (*Linaria*) may be used to edge the beds of their near relatives, notably *Linaria splendens* (purple), and the neat *L. bipartita aurea*. The very pretty variegated form of the Wall Toad-Flax (*L. cymbalaria*) is very elegant, but is only to be relied on in a few dry soils and in exceptional seasons. The same may be said of the pretty variegated form of the Ground Ivy (*Glechoma*). My theory is that by persistent coddling the plants are weakened, or it may be the absence of chlorophyll in their leaf-cells (variegation) that makes them weak.

Without exception, the Mesembryanthemum tribe is happy at the seaside, many kinds being hardy in the S. and S.W., therefore use these neat plants freely—*M. cordifolium* and its variegated kind, *M. roseum*, and its white sport, called in the trade *argenteum*; while on sandy slopes the lovely *pulchellum* opens its pink stars to welcome the morning sun; and a large yellow-flowered kind which I am unable to identify. It has large, succulent, triangular leaves, makes a noble bed, and may be edged with *M. cordifolium*. The annual, *M. tricolor*, sown early in heat and planted out in May, will continue in flower a long time, especially if its small, Fig-like fruits be constantly removed as formed. An allied plant, *Othonna crassifolia*, is one of the best plants for planting in small vases or on the verges of steep slopes, and where it thrives gives an endless succession of golden star-like flowers. The brilliant *Portulacacas* occur to one's memory here. These may be sown in pans and transplanted to a sunny sandy bank in April or early in May; or better, they may be sown broadcast in the open-air. This plant is neat and procumbent, and the blooms among the most brilliant of their class. *P. Thellusoni* and *P. Thorburni* are yet the two finest, and all are good; while the single are much preferable. To get the maximum of flower the soil should not be too rich, and very sandy. So used, nothing can exceed the brilliancy of this flower when at its best.

Another flower that is most reliable for continuous blooming is *Phlox Drummondii*. Choose the old kind, not *grandiflora*; and for small beds a German selection called *Haynaldi* and *Haynaldi cardinalis* are dwarf and compact, and the flowers almost metallic in their brilliancy.

The *Dianthus* or Indian Pink tribe, the Japanese forms of which are called *Heddewigii*, after a German explorer, may be here mentioned. These in size are very noble, also rich in colour; they may be raised in gentle heat, gradually hardened off, and transplanted in April or May. The single form is far the best for effect, and the smooth-edged preferable to the deeply-fringed section known as *laciniata*.

Begonias, once the fashion, are seldom of much service except in exceptional seasons, being much too brittle to withstand even the ordinary sea breezes. Exceptions to this are the small-flowered group, *semperflorens*, represented by

S. vera and its white form; while the free-blooming *B. Davidiana* is to be recommended for its dark, metallic foliage and great freedom of flowering, but it should have a good sheltered position. Let it have the centre of the beds, and be edged with any of the dwarf and sturdy varieties of *B. semperflorens*.

Annual Chrysanthemums, now so varied and greatly improved, may be used freely; but the choice should rest with the rigid-growing section known as *C. carinatum*, with moderate-sized flat flowers and finely-cut elegant foliage. The wild Corn Marigold, *C. segetum* is quite at home by the sea-shore, and has now some very fine hybrid forms, as *grandiflorum*, &c.; and for those who prefer double flowers, the compact flowering kinds may be chosen, as they are well coloured and free-blooming in ordinary seasons.

The only Dahlias suitable are the very dwarf single ones, known as Tom Thumb; these range from 6 inches to 1 foot in height, and are free and continuous in their flower production. The range of colour in these is extensive, from pure white in *Snowflake*, to dark maroon and crimson in *Venus* and *Bo-Peep*.

Of Fuchsias the hardy kinds have already been noticed in these columns, and the rest are, with the exception of the variegated and highly coloured-leaved section, embracing *Burning-bush*, *Sunray*, &c., which should be pegged down, of not much value in seaside beds.

Petunias may be used, preference being given to the free-blooming and small-flowered section known as the dwarf striped French. For a fragrant bed use the white species known as *nyctaginiflora*, the fragrance of which resembles that of its near relative *Nicotiana affinis*, and, like it, it is hardy in the South, young seedling plants surviving the winter, and flowering early in the summer.

The double Petunias make excellent beds, being compact in habit and very floriferous. The named kinds are best, as they may be depended upon for colour and also for height, two essentials in successful bedding. The single strain known as *compacta multiflora* in Germany, will be found admirably suited to our purpose, as it is dwarf, very much branched, and certainly many flowered. A selection I have seen in Norfolk called *White Queen* is undoubtedly by far the best white for small beds. It is to be regretted that there are not more among the coloured section like this in habit.

A good plant to edge beds of *Petunia* is *Cineraria maritima*, and to keep this white, bed it out in pots to check vigour; nor must the silvery *Centaurea ragusina* and *candidissima*, be forgotten; and these plants are very happy even if within the salt spray.

REMARKS ON THE CONDITIONS OF THE FRUIT CROPS.

(See Tables, ante, pp. 72—77.)

(Continued from p. 113.)

SOUTHERN COUNTIES.

BERKSHIRE.—The fruit crops in this neighbourhood are the worst in my recollection. Apples and Pears are almost a complete failure, and the stone fruits are nearly as bad. A few varieties of Apples showed good promise, but were cut off by the frost. Pears, Plums, Peaches, and Cherries showed well, but dropped off after the fruit was formed. Strawberries were a good crop, but the season was very late and the fruits were soon over. Other small fruits were of fair average and quality. J. Howard, Benham Park Gardens.

— The fruit crops, including Apples, Pears, Plums, Cherries, Peaches, Apricots, small fruits and Strawberries, up to the end of March, were very promising, in fact, much above the general average here. But the month of April, during which we

registered over 100° of frost, left us without any of the above-named, with the exception of small fruits and Strawberries, which were much below the average. *W. Fyfe, Lockinge, Wantage.*

— The severe frosts of April 15, 16, 17, 18, and 19, completely destroyed all Apples, Pears, and Plums. Red Currants, Gooseberries, and Strawberries escaped, and are carrying a very fair crop of fruits. *Jas. Coombes, Englefield Gardens.*

DORSET.—I have to record the worst fruit season I have known for the past twenty-five years. As regards Apples, Pears, Plums, and Cherries, there are practically none worth speaking of. Of small fruits, Strawberries have been very good, Gooseberries very fair, Raspberries and all kinds of Currants very moderate, and on the small side. The frosts of April 12 to 25 are undoubtedly the cause, as then we registered from 7° up to 15° on two nights, on the 17th and 18th, which was most disastrous to all fruit crops. *Thos. Denny, Down House Gardens, Blandford.*

— The fruit crop in this district is about the worst on record. All promised well in early spring, but severe frost and damp biting winds about the end of April destroyed blossom and young fruit wholesale. Pears and Plums are a complete failure; Apples about quarter of an average crop; dessert Cherries, none; Morellos, half a crop; Peaches and Nectarines a failure; Apricots—the best crop we have on walls, but under average; Gooseberries and Raspberries very good; Currants, thin; late Strawberries, good, early varieties spoilt with cold rains. *Ben Campbell, Kingston House Gardens, Dorchester.*

— All round the fruit crop is the worst known for many years. Not only is our general collection of Apples almost a failure, but the hardy cider kinds are equally deficient. The frosts experienced during the second and third weeks in April, which killed the Pear, Plum, and Cherry bloom, are not accountable for the failure of the Apple crop, but rather the wet and sunless season of 1902, for where the trees blossomed well there was a conspicuous want of vigour in the bloom. Pears are a total failure on bush and pyramid trees, and only on south aspects is there any fruit on wall-trees; and here the crop is not only a scanty one, but up to the present it is poor in quality, and no amount of attention in the way of root-waterings, &c., will induce them to grow; the trees also are covered with honey-dew, and looking most miserable. The remarks with regard to Pears applies exactly to the Plum crop. Sweet Cherries have been good on west walls, but Morellos are a very scanty crop indeed. Apricots also are a very scanty crop, and the same remark applies to Peaches and Nectarines, and the trees of the latter suffered badly also from the late frosts. Strawberries have been abundant and good, as also are Gooseberries and Red Currants. Black Currants are very scarce, and have realised just treble the price got for them in former years. Except in sheltered gardens, the Raspberry-crop is much under the average, the bearing canes having been hard hit by the frosts in April; and the young canes were killed to the ground-level, but are now making satisfactory growth. Cob, Filbert, and Walnuts are exceedingly thin on the bushes and trees. *T. Turton, Castle Gardens, Sherborne.*

— Fruits promised favourably, but were punished severely by late spring frosts of unusual severity. Pears turned black and fell in quantity from the trees. Gooseberries yielded a tremendous crop, and bush fruit is generally good; being rather thickly together, they formed their own protection to a great extent, and did not suffer as standard fruits did. *J. Benbow, Abbotbury Castle Gardens, Dorchester.*

HANTS.—The fruit crops in this district are very poor. Strawberries were fair, also Gooseberries and Raspberries. No Apples, Pears, Plums, or Damsons. Peaches and Nectarines are thin, but will be good. The late frosts and cold weather we experienced are the causes of failure. *Arthur Lee, Palace House Gardens, Beaulieu, Brockenhurst.*

— Strawberries in this district have been, as they always are, a good crop, in spite of the adverse weather at the time and previous to flowering. Sir Joseph Paxton, as usual, is still the best variety for market purposes. Royal Sovereign and Leader are making headway as early varieties; neither, however, travel so well as the first-named "Joe's." Apples, Pears, and Plums are the worst crop known for years. The trees, however, are full of promise for next season. *Ed. Molyneux, Swanmore Park, Bishop's Waltham.*

— The appearance of all fruit-trees early in the season gave promise of a bountiful crop, but our hopes were blighted by the severe frosts in April (11th to 24th, when we registered 113 during that period). Apples are poor indeed, Pears worse. Plums very thin, as the trees were covered with a mantle of snow at blooming time. Strawberries have been very good indeed, with us the crop of the year. Currants very good, especially red varieties. Gooseberries fair average crop, Raspberries poor, Peaches and Nectarines scarcely any outside, but in unheated cases we have abundance. Nuts thin, Walnuts none. *A. G. Nichols, Strathfieldsaye Gardens, Mortimer, R.S.O.*

— The fruit crops in this district are the worst that have ever been known. Very few Apples: the best are Lord Grosvenor, Lord Suffield, Lord Derby, and Irish Peach. Plums—some of the varieties have a fair crop, Rivers' Prolific, The Czar, Prince Englebert, and Victoria, are the best. Pears are the worst of wall fruits. Peaches very few and trees badly blistered. All small fruits are under average, except Strawberries, which are good. *J. Bowerman, Hackwood Park, Basingstoke.*

— In this locality Apples, Pears, and Plums are a complete failure. There are whole orchards without any fruit on the trees, and the trees themselves have suffered very badly. Peaches, Nectarines, and Apricots are also a failure. We grow a great many outdoor Peaches and Nectarines here; this year we have not two dozen fruits on all our trees. Strawberries, Gooseberries, and Currants are with us an average crop. *Thos. Leith, Beaurepaire Park Gardens, Basingstoke.*

(To be continued.)

The Week's Work.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury.

Dendrobium Phalaenopsis Schroderiana.—For flowering during the autumn months, there is no more beautiful Orchid than the one whose name is at the head of this note. It is better when grown by itself, where it may have abundant air and sunshine afforded. The smoky air of large towns is inimical to its well-being, especially when the flowers appear late, as many of them then drop off in foggy weather. The flowering of the plant, even in rural districts, owing to the lack of sunshine, is likely to be noticeable this year. Our plants which have made the best pseudo-bulbs are those which were potted last year in a leaf-mould compost, and not disturbed this season, some of these having doubled the length of the pseudo-bulbs made last year; but flower-spikes in accordance cannot be expected, unless the former are thoroughly matured. No shading should now be made use of, except during the

middle hours of the day if very bright, until such time as the flowers begin to expand, when the blinds must be lowered to preserve the blooms from scorching. Abundance of moisture will be needed at the root until the flower spikes are removed, then less will suffice. The atmosphere should be kept a little drier, damping the houses in the morning only. Here a little top air is left on the house at all times after the flowers begin to expand, but the hot-water-pipes are always kept warm to prevent the temperature dropping too low.

Dendrobium formosum.—This useful species is also finishing up its growth, and is about to commence expanding its attractive white flowers. The treatment of the plant at this season is similar to that for *D. Phalaenopsis*, and the plants are very effective when grouped together with that one. After flowering is over they can be rested together in the same house, which should be warm and dry.

The Cool House.—The growths of *Odontoglossum Rossii*, *O. Cervantesii*, *O. (Erstedii)*, and the natural hybrids, *O. Humeanum* and *O. aspersum* being sufficiently advanced, the plants may be repotted or surfaced as may be required. Fern-rhizomes may be employed as drainage material, and a potting compost consisting of two-fifths turfy peat, two-fifths leaf-soil, one-fifth chopped sphagnum. This should be made moderately firm, and clean fresh sphagnum laid on the surface. Shallow pans are the most suitable receptacles, as these can be suspended from the roof, in which position the plants grow well. If space can be afforded, newly-potted plants are the better for being stood on the stage till established. As the compost does not dry there so quickly as when the pans are suspended, a very small quantity of water will be needed to keep the compost moist, but when thoroughly established water will be needed in greater quantity, the compost, however, being allowed to become dry before water is afforded, more especially in the case of *O. (Erstedii)*, a species which is injured by constant excess of moisture at the root.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PIGOTT, Bart., Wexham Park, Slough.

General Hints.—In fine weather, when the soil is dry, hoe between all young crops, destroying weeds and aerating the soil. The clean appearance of the garden in winter largely depends on keeping it clean in every part at the present season, as after September weeds are more difficult to kill. Remove all remains of spent crops, clean up and burn all weeds, trimmings, and refuse.

French Beans.—Plants growing in pits and frames should be exposed as much as possible to sunshine, protecting them only on cold nights and from heavy rains. The plants must on no account be crowded, strong-growing varieties being allowed 10 inches from plant to plant. Let the plants be earthed-up to the seed leaves with turfy loam, leaf-soil, and spent manure from Mushroom-beds. Make another sowing in heated pits, or in pots which may be placed in a brisk temperature when necessary. Should the former method be adopted, make up the bed close to the glass, allowing just sufficient space for the growth of the plants. For pot-culture, choose 8 or 10-inch pots; and having afforded each good drainage, half fill them with a rich loamy compost, rather rough than fine, dibble-in five Beans in each, cover with soil to the depth of an inch, and stand the pots in a cold frame.

Endive.—The last sowing should now be made, choosing a situation on a south border. If cold frames are available mark out the space for these, but make no use of them till winter is approaching. Batavian Endive is the best for withstanding cold, and should be the variety now sown. Plants from the earlier sowings should be thinned and the thinnings planted before they become drawn. As soon as Endive has attained to full size tie up a number sufficient for daily use for a fortnight, but never do this when the plants are wet.

Radish and small Salads.—Make sowings forthwith on rich soil; sow also Mustard and Cress,

protecting the seeds from the sun and wind with mats or a thin covering of straw.

Peas.—Late-sown Peas coming into bearing should be afforded well diluted liquid-manure and be made safe against the wind with stout stakes inserted here and there in the rows, and connected with soft string.

Capsicums and Chillies.—If these plants are grown in pots in cold frames and they are carrying heavy crops of pods, a top-dressing of turfy-loam and cow-manure may be applied, and liquid-manure alternately with clear water. Syringe the plants twice a day with sun-warmed water.

Gourds and Pumpkins.—Fruits now developing should be exposed fully to the sunshine so as to get them well coloured and well flavoured. Plants growing on manure-heaps or on very rich soil will need no manure-water, but others on a poorer medium should have abundance of liquid-manure applied at the root.

THE FLOWER GARDEN.

By J. C. TALLACK, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

Cuttings of Plants which may now be Struck.—Among the various plants cuttings of which may be inserted forthwith are Violas, Pentstemons, and Antirrhinums. All of these are easily raised from seeds, but cuttings are to be preferred, as not only is the gardener able to make sure of certain colour effects, but a choice may be made from plants having a similarity of habit, which tends to promote a uniformity of growth that is absent in seedlings. Viola cuttings should be made from the small and firm shoots which may be found near to the centres of the plants. In the case of Antirrhinums, the small side growths provide the best sort of cuttings; and of Pentstemons any of the weak but healthy shoots that give no promise of flowering this year may be used. These, being hardy plants, may be rooted and wintered in cold frames placed on a hard, impervious bottom in an open position, elevated slightly above the surrounding level, so that water may readily drain away. A bed of sandy soil about 3 inches thick should be placed in the frames, into which the cuttings should be dibbled from 2 to 3 inches apart, and watered in. The frame must be kept close and shaded for a few days. If the old double crimson or any other choice Sweet William is grown, cuttings made from the smaller and more wiry growths may be struck in the same manner, a few being taken each year so as to provide against possible losses.

Bedding Plants.—Continue the propagation of bedding plants of all kinds until a sufficient stock has been secured, always allowing a considerable margin for losses. Where a good selected strain or strains of dwarf Lobelias have been secured, some of the plants should have all the flowering stems cut back a few inches, but should not be potted-up till later. Such make excellent plants for furnishing cuttings in the spring.

Deciduous Hedges, &c.—Beech, Hornbeam, or any other deciduous hard-wood hedges should now be clipped, before the new growth gets too hard. Fairly early clipping (i.e., as soon as possible after the second growth is mature) makes a very considerable difference in reducing the amount of labour required in using the shears. Some species of evergreens may also be gone lightly over, removing some of the strongest growths which may be getting too prominent or spoiling the symmetry of the bushes; but nothing like hard cutting-back should be indulged in at this season.

Lawns.—Bare patches on lawns should be pricked over, some suitable lawn grass-seeds sown, and be covered with a sprinkling of finely sifted soil, and then rolled or patted firm and smooth with a spade. August is a good time either for this patching work or for sowing grass seeds for forming lawns, the formation of which is sufficiently advanced; and in such cases it is better to sow now than to wait till the spring, as time will be saved, and the quality of the grass will be all the better.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bletton, Budleigh Salterton, Devonshire.

Fuchsias.—Cuttings inserted now and grown-on steadily without any rest make fine plants that will flower early next summer. Choose the points of growing shoots, pinch off all the flowers, and insert half a dozen around the edge of 3-inch pots filled with equal parts of loam and leaf-soil and a fair amount of silver-sand, and a little on the top of the soil to filter down with the cuttings. Place the pots on a mild hot-bed, or, failing this, stand them in a cold frame. Keep close and shaded in either case, dewing them overhead once or twice daily in bright weather, when in about five weeks they will be rooted well enough to be placed on a light shelf near the roof of a greenhouse, and be potted off singly into 3-inch pots a few weeks later. I find Ballet-Girl, Mr. Gladstone, Molesworth and Mdme. Carnot good double-corolla varieties; and among the single-flowered, Mrs. Marshall, General Roberts, Lord Beaconsfield, Rose of Castille (improved), Lady Heytesbury, Beauty of Wiltshire, Brutus, Loveliness and Eclipse all very free. Fuchsias have done grandly this season, owing to the coolness of the weather. As the earlier-flowered old plants get exhausted, stand them in a sunny spot outdoors to ripen their growth. Plants in full flower should be assisted with manure-water occasionally, and by keeping all seed-vessels picked off.

Primulas.—The double-flowered variety alba plena should be ready to be moved into 4½-inch and 5½-inch pots, using a soil similar to that advised for Primulas in a former Calendar. Pot fairly firmly, and place in cold pits or frames near the glass, standing the pots on a floor of coal-ashes, but avoid affording too much water now and throughout the winter and spring. Keep a bit closer for a few days after repotting, and afford a thin shade in bright weather, lightly dewing them overhead with the syringe about 3 p.m. on such days, and removing all flowers for a month or six weeks. The same remarks apply to any of the single-flowered Primulas standing in small pots. Fumigate the frame two nights in succession should green-fly attack them, which they, as well as thrips, often do if their surroundings are too dry.

Calceolarias.—These plants will be fit for pricking off into boxes 2½ inches asunder, in a compost consisting of equal parts of sifted loam and leaf-soil, mixed with a good proportion of silver sand. Place them in a similar structure to that mentioned as being suitable for Primulas; those having a northern aspect for preference, and afford a like kind of treatment, keeping a close watch for slugs. Great care is necessary when dibbling-in the seedlings so as not to bruise the tiny stems, or failure will ensue.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maldenhead.

The Fig.—The excessively wet weather has caused many of the fruits to crack, and so long as present conditions last, a freer growth of shoots than usual should be allowed; but the trees must not be allowed to become crowded, or the shoots will not withstand frost well. In the southern and western counties the Fig succeeds, and ripens its fruit on standards planted in sheltered places, and the fruits from these trees are always of fine colour and good flavour. There are sheltered gardens in the Midlands where this method of culture might be tried, the branches being protected against frost with straw, Asparagus-tops when dried, or a double thickness of bast mats.

Cob-nuts and Filberts.—Remove suckers from the bases of the bushes, unless any are required for planting later on. The wet weather has caused all kinds of weeds to grow apace, and an effort should be made to clear the ground forthwith under the nut-bushes by pulling up the largest and casting them on the rubbish fire, the Dutch-hoe being used to destroy weaker ones when the weather is dry. If squirrels make havoc with the crop they must be killed, or there will be no nuts left to ripen.

Hints on Work in General.—The fruits being cleared from the Raspberry-canoe, cut away these and pull up all suckers not wanted for increase. Having done these jobs, secure the young canes to the stakes or wires loosely with soft string or bast. Autumn fruiting varieties must be protected with nets. The scarcity of dessert fruit in general will make autumn-fruiting Raspberries very valuable.

Plums.—Fruits of early Gage Plums are now ripening, and it is well to go over the trees every other day and gather all ripe fruits, which place on sheets of tissue-paper in the fruit-room for future use. These fruits will keep in good condition for several days.

FRUITS UNDER GLASS.

By T. H. C.

Late Vines.—It is of much importance to check all sub-laterals on late Vines in bearing, and thereby direct the energies of the Vine to the fruit, and permit sunlight to reach the laterals and principal leaves. Gros Colmar is a variety which requires a longer period to ripen than any other black Grape, and must be afforded artificial warmth throughout the autumn to enable it to finish properly. Other varieties are colouring fast, and should be afforded free-ventilation day and night; less, of course, during the night, and gradually opening the ventilators or sashes more or less in the morning as the state of the weather permits. Maintain the Vine-borders in a moist state, and apply diluted cow-stable drainings, or sprinkle Thomson's Vine-manure on the surface, applying water to carry it down to the roots. Maintain the atmosphere in a moderately moist condition till the berries are of full size; when a moving, dry, warm air is desirable. At present a night warmth of 62° to 65°, and by day a temperature of 72° to 80° may be afforded. Lady Downe's Seedling (one of the best late Grapes), Black Alicante, Gros Colmar, Appley Towers, and Mrs. Pince are likewise good Grapes for keeping; while Muscat of Alexandria, if well ripened, keeps for a considerable length of time if cut with a piece of the shoot and put into bottles of water in the month of November.

Vine Borders.—The end of the present-month is a good time to examine the borders of the earliest Vinery as to their condition, if loss of vigour is remarked in the Vines, shanking in the bunches, lack of size and colour in the berries, or any other evil, that may be caused by defective root action. By dealing with the borders at this season, the roots have time to seize upon the fresh soil before the leaves fall. If there are outside as well as inside borders, let a commencement be made with that inside the Vinery first, and renovate the outside border next-year. Carefully remove the soil from among the roots, tying the latter in bundles as the work proceeds, keeping them moist and as little exposed to the air as possible. Having put the drainage into a proper state, make up the border with a compost consisting of good turfy loam, to which may be added, according to the quality of the loam, a heavy sprinkling of ½-inch bones, mortar rubble, and charcoal; then proceed to spread the roots out at different depths, having previously cut away decayed or bruised parts. Make the soil firm by trampling it, and afford tepid water abundantly, and mulch with a good thickness of spent Mushroom-bed materials. Let the foliage be syringed morning, noon, and evening, in very bright weather. Apply a slight amount of shading. The depth of a border, exclusive of drainage, need not exceed 2½ feet. In the case of aged Vines it may be prudent not to thoroughly renew the borders, but much good will result by removing all the inert soil down to where the roots are plentiful, making up the border again with a rich compost, in which carefully spread out the roots.

PUBLICATIONS RECEIVED.—Crop Report from Messrs Shuls & Graot, Enkhuizen, Holland.—Proceedings of the Agri Horticultural Society of Madras, January to March, 1903. Contents: Superintendent's Notes, Rainfall, Governor's Visit to the Gardens, Flower Show, &c.—Agricultural Bulletin of the Straits and Federated Malay States. Edited by H. N. Ridley. Contents: Rattans (concluded), by H. N. Ridley; Cocoa-nut Beetles, Camphor Tree, the Mosquito Plant, Rubber, &c.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the **EDITOR**, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	AUG. 25	Royal Oxfordshire Horticultural Society's Show. Brighton and Sussex Horticultural Society's Show (2 days).
WEDNESDAY,	AUG. 26	Royal Botanical Society's Meeting Harpden Horticultural Society's Show. Bath Horticultural Society's Show (2 days). Reading Horticultural Society's Show.
THURSDAY,	AUG. 27	Sandy and District Floral and Horticultural Society's Show. Irish Gardeners' Association's Meeting.

SALES FOR THE WEEK.

MONDAY, WEDNESDAY, and THURSDAY NEXT—Trade Sale of over 2,500 lots of Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10 o'clock.

FRIDAY, AUGUST 28—Established Orchids in variety, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—61.6°.

ACTUAL TEMPERATURES:—

LONDON.—August 19 (6 P.M.): Max. 68°; Min. 54°.

August 20.—Showery 64°.

PROVINCES.—August 19 (6 P.M.): Max. 65°, Home Counties; Min. 51°, Shetland.

Hollyhocks (see Supplement). DOES anyone know the meaning of the word? Does anyone know whence the plant, as grown in gardens, originated? We ask because the books either give different statements or express no opinion at all; and the copyists either repeat what their predecessors have said, without any attempt at verification, or they maintain a discreet silence. As to the name, PRIOR is vague and uncertain; BRITTEN and HOLLAND do not venture on any explanation. Where authorities like these are in doubt or are silent, it is becoming in us to pronounce no opinion.

Now as to the source. The books mostly give China as the country whence the Hollyhocks have been obtained; but HEMSLEY, in the "Index of Chinese Plants," published in the *Journal of the Linnean Society*, only says it is cultivated and subsontaneous in China and Japan; and in the *Flora of British India* MASTERS says it is often cultivated in Indian gardens; so that there is little or no evidence that it is wild either in China, Japan, or India. There is no doubt, however, that *Althæa* or *Alcea rosea*, the origin of the common Hollyhock, is wild in certain parts of Greece and Italy, and in what the *Index Kewensis* comprehensively calls "Oriens."

The *Botanical Magazine*, tab. 3198, published in 1832, tells us that it was introduced

from China in 1753, but long before that, viz., in *Gerard's Herbal* (1597), at p. 784, it is figured under the name "Malva arborea flore nigro multiplici, the Tree Hollihocke with double flowers." At that time of day the term "Hollihocke" included all the plants we now call Mallows. "These Hollihockes," says GERARD, "are sown in gardens almost everywhere and are in vaine sought for elsewhere," so that he did not know the native country. A search through the old herbals of Germany and the Low Countries, from which GERARD derived much of his information, would no doubt be attended with interesting results.

In our own times the Hollyhock has undergone vicissitudes. The florists have decreed that the guard-petals, as they call them, shall be reduced to the smallest proportions, and thereby have, in the eyes of most flower-lovers, completely mauled the beauty of the flower.

A worse disaster than this overtook the plant a few years ago, when the Mallow fungus, *Puccinia malvacearum*, attained suddenly unwelcome predominance and almost destroyed the then existing plants. Exactly why the fungus suddenly assumed such virulence we do not know. It existed and still exists on the wild Mallows of the fields, where its ravages do not appear to be of a serious nature. Nor do we know why the severity of the attack has so much abated. We know that some fungicides, such as Condy's Fluid and Bordeaux-mixture, have been used by some keen florists, but the great majority have been content to let things take their own course. In any case, the Hollyhock now rears its stately spikes in full many a garden, to the joy of those who appreciate form and colour.

The best general account of the Hollyhock that we know of is that written by Mr. W. PAUL, entitled "An Hour with the Hollyhock." That treatise was written more than half a century ago, but requires but little to bring it up to date. It is included in Mr. PAUL'S *Contributions to Horticultural Literature*, a book we cannot too strongly recommend the young gardener of the present day to peruse, and not only to peruse, but to study.

The Wisley Garden.

NATURALLY the splendid gift which Sir THOMAS HANBURY has made to the Royal Horticultural Society has filled all our minds. It was with a strong desire to see this remarkable garden that a visit was paid there on Friday, August 14, from Byfleet station; and more recently the Council of the Society has visited it in company of Sir THOMAS HANBURY. By a narrow country road or lane of some three miles in length we arrived at our destination. It rained heavily on the road, but fortunately not after we reached Wisley. It is here worth mentioning that the late Mr. WILSON'S head gardener, Mr. TATNALL, regards Horsley station, on the new Guildford line, reached by trains that go from Waterloo *via* Surbiton, or by Leatherhead, as the nearest and most direct route. Vehicles can also be obtained at Horsley, the distance being about three miles. The route is through the village of Ockham, and past Lord Lovelace's park, coming out into the Ripley road. Some half-mile or so up towards London a narrow turning, at which there is a board fixed indicating the position of the garden, may

be seen on the left hand. All the world might pass up or down the Ripley road and never know of the existence of such a garden. A few hundred yards onwards, Wisley Hüt, a famous house of entertainment, opposite which is a superb lake, is just about half a mile from the garden entrance. But if Weybridge station be fully five miles from the garden, at least at the present moment, the ride alone, apart from the garden, is worth taking. From the turn at the Fox Warren Lodge, beyond Byfleet, by which the road passes, leaving the fine St. George's Hill on the left, into the Ripley road, there is on both sides beautiful open common-land, and just now the huge areas of purple Heather are indeed glorious to see. Those who have not yet seen these marvellously beautiful spreads of colour on Wisley Common have something to regret.

It is suggested that an electric light railway may at some time be laid along this beautiful road. It is not probable that this will be done very soon, as for miles there are very few inhabitants, and the lover of beauty may well trust that never should this natural beauty be spoiled by such associations. The garden is as nearly as possible twenty miles from Hyde Park corner. Weybridge station is eighteen miles, and Horsley station twenty-two miles from Waterloo.

The one great drawback to the garden for the purposes of the Royal Horticultural Society is its distance from any railway-station. Should the ordinary work in which the Committees are interested be transferred there, it is evident that the Council will have to make arrangements to convey members of those bodies to and fro free of expense, and also to provide at the garden refreshment accommodation. Were the latter provided, the gardens might then in the spring and summer become a great resort for the Fellows, for it is certain that all who love the beautiful in horticulture will find at Wisley delights which they have never before tasted.

It is no exaggeration to say of the garden that it is unique. There is scarcely any other such garden in the kingdom. It is a garden devoid of all plan, and is in all its aspects as wild as a garden can be—a garden that no pen can adequately describe nor picture portray. It was made piecemeal, and as the late Mr. WILSON'S fancy dictated. There are no broad set paths, no geometrical beds. All is natural, yet natural with plants of every conceivable and, to many of us, inconceivable description. Our advice to all is, Go and see it at once.

Not a thing is named. That may be regrettable in a public garden that is to be educational; but labels in such a garden, if used, must be numbered by thousands. Probably the only man who knows everything there and its whereabouts is Mr. TATNALL, who, under Mr. WILSON'S supervision, made this garden. There is no digging permitted in the many acres thus wildly planted. The men do little else but pull weeds and occasionally use the knife. As the garden is, so it must be kept. No Philistine hand must be laid upon it. Outside there are some forty acres of open land that can be utilised for any utilitarian purposes—for fruit or vegetable or flower-culture, or for an arboretum; and it is good land too.

WISLEY.—In view of the large number of letters I am receiving, asking if Wisley Garden can be visited by Fellows, will you permit me to say that at present the property has not yet been [formally] handed over to the Society, and that none of our officers is there as yet. It is therefore impossible to open it to the Fellows at present—in fact, some few months will probably elapse before that can be done, but due notice will be given to all Fellows as soon as possible. *W. Wilks, Secretary.*

ENGLISH ARBORICULTURAL SOCIETY.—The members of the above Society who held this week their summer meeting at Reading, travelled to Newbury, and drove from thence to Highclere Castle, the seat of the Earl of Carnarvon, who had invited the Society to visit his estate. The visitors first halted at the Castle, and they were particularly interested in the fine Cedars of Lebanon, which in large numbers stand within sight of the stately building. After inspecting the ornamental trees and the gardens, the party drove to Beacon Hill, which is surmounted by a deep fosse, bearing evidence of its great antiquity as a military station. A visit was also paid to Lord Carnarvon's stud-farm for race-horses, after which a drive through other portions of the estate brought them to the Cricket and Tennis ground, where Lord Carnarvon entertained them at luncheon.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—At the meeting of the Floral Committee on June 27, 1903, First-class Certificates were awarded to *Odontoglossum crispum* var., from Mr. W. C. BARON VAN BOETZELAAR, of Maartensdijk; to *Rosa polyantha* (seedling), an improvement on *Euphrosine*, as a new plant, from Messrs. GRATAMA BROTHERS & Co., of Hoogeveen. Certificates of Merit were granted to *Delphinium hybridum* Prof. van Sterson as a new plant, from Mr. W. VAN VEEN, of Leyden; to *Biota orientalis aurea* seedlings, from Mr. A. Spaargaren, at Aalsmeer; to *Cattleya Mendeli* (variety), from Mr. P. W. SUTORIUS, at Baarn; to *Dianthus plumarius* Moerheimi, as a new plant, from Mr. B. RUYTS, of Dedemsvaart; to *Papaver orientale* Mahony, as a new plant, from Mr. B. RUYTS, at Dedemsvaart. A Cultural Commendation for *Gnaphalium Leontopodium* (specimen) from Mr. J. M. GOES DE CASTRICUM. A Silver Medal to a collection of hardy perennials (cut flowers) from Mr. RUYTS, Dedemsvaart.

— At the meeting on July 29 First-class Certificates were awarded to *Anthurium* J. H. Tromp Meesters as a new plant, from Mr. J. H. TROMP MEESTERS, at Steenwijk, with felicitations of the jury; to a *Begonia Fleur de Neige*, *Chrysanthemum frutescens* Saharet, *Fuchsia Andenken*, from HEINRICH HENKEL; as commendable plants from General ADRIAAN VAN SWIETEN, Tuinbouw School, at Frederiksoord; to *Canna indica Junon* as a new plant, from Messrs. VAN NAMEN BROTHERS, at Zwijndrecht. Certificates of Merit were granted to *Hæmanthus fascinator*, from Mr. A. S. VAN DEN BERG, of Amsterdam; to *Rose Lady Roberts* as a new plant, from Mr. H. J. BEERNINK, of Aalten; to *Chrysanthemum segetum Helios* and *Alonsoa miniata superba*, both from Messrs. GROENEWEGEN & Co., at Amsterdam. A Botanical Certificate was awarded to *Ageratum mexicanum crispum* from Messrs. GROENEWEGEN & Co., at Amsterdam, and a Cultural Commendation to *Chrysanthemum Soleil d'Octobre*, from Messrs. BODES and LEMHES, of Dordrecht, for successful culture. A Silver Medal as a 1st prize for a collection of *Delphiniums* was awarded to Mr. W. VAN VEEN, at Leyden.

THE HOME COUNTIES NATURE-STUDY EXHIBITION.—We are informed that the Home Counties Nature-Study Exhibition will be held

at the offices of the Civil Service Commission (formerly the buildings of the University of London), Burlington Gardens, London, from October 30 to November 3. Prospectuses, regulations, and prize-lists can be obtained from Mr. W. M. WEBB, Honorary Secretary, 20, Hanover Square, N.

M. COGNIAUX.—We are interested to find that among the recipients of academic honours at the recent celebrations at the University of Heidelberg was M. COGNIAUX. This celebrated botanist, known among horticulturists for his labours among the *Orchidaceæ*, was admitted to the degree of Doctor *in honoris causâ*. It would be difficult to find any one more worthy of such an honour.

SPECIFIC NAMES.—Sir WILLIAM T. THISELTON-DYER writes:—"I find in the *Gardeners' Chronicle* for August 15 last (p. 121) a letter from Mr. H. M. BATSON, which contains a statement which seems to me to require a little elucidation. In the *Kew Hand-Lists* I have deliberately adopted a practice of printing adjectival specific names without a capital. Mr. WOLLEY DOD is so good as to describe this as 'logical and consistent.' I will confess that I am of the same opinion, and that, in fact, this is the reason which led me to adopt the practice. I find, if I understand him correctly, but I am not sure that I do, that Mr. BATSON thinks that 'this practice seems merely to suggest that there has been carelessness in compilation or in proof-reading.' This strikes me as not a very gracious criticism of work which has been in great measure undertaken for the benefit of the horticultural world, with the expenditure of very considerable pains. That, however, is by the way; to test its validity would be a work of very considerable labour. I have no doubt that Mr. BATSON has in his eye instances of inconsistency on our part. It would be a favour if he would point them out."

PRESIDENT ROOSEVELT has the reputation of being skilled in forestry and horticulture. A portrait before us shows the President, axe on shoulder, on his way to fell a tree, Gladstone-fashion. It is to be hoped that he shows as much tact and discretion in woodcraft as in statesmanship.

DR. ALBERT WEBER died in Paris on July 27, at the age of seventy-three, after a somewhat prolonged illness. He was born in Strassburg, and from an early age he devoted himself to the study of the Cactus family. When eleven years old his mother made him a present of the first edition of Forster's *Handbuch der Kakteenkunde*. Soon after, he met Mr. SAGLION, who had a very large and most famous private collection of Cacti at his residence near Strassburg. It was here that Dr. WEBER laid the foundation of his studies. Later on, throughout his whole medical career, he spent his spare hours studying Cacti. He then had the opportunity of accompanying the French army of occupation to Mexico, in the reign of NAPOLEON III., and to study these plants in their native country. He spoke of himself as a pupil of Dr. ENGELMANN, with whom he kept up a regular correspondence. He never published anything during Dr. ENGELMANN's lifetime. He was certainly one of the best authorities on Cacti. Many species have been named by him, especially *Opuntias*. It was surprising how well he knew them, and how carefully he investigated them before he gave an opinion. There are still some plants in La Mortola which were named by him, and which have not yet been published. Only last September he paid a visit to La Mortola; he then appeared in the best of health, and it was interesting to watch him climbing over the rocky places in the garden, where he examined every succulent, from *Opuntias* to the most inconspicuous *Rhipsalis*, with the greatest interest and

enthusiasm. He was an honorary member of the Deutsche Kakteen Gesellschaft, and his loss will be deeply felt throughout the botanical world.—*A. B.*

IS MUSHROOM-SPAWN SEED?—Of course a botanist would have no difficulty in replying in the negative, but the Customs-House officers in India, it appears, think differently, and levy a duty on imported spawn as if it were seeds. The matter has not been contested in the law courts, or we might get our minds improved.

DESTRUCTION OF FRUIT CROPS IN JAMAICA.—A strong gale began to blow to the north lately in the island of Jamaica, and shifted to all points of the compass, growing in power and fierceness as it blew and changed its base until, as a hurricane, it had reached the estimated velocity of 120 miles an hour. Nothing could, as nothing did, withstand the terrible force of this visitation—houses, villages, homesteads, all were wiped out; and fruit-trees, fruit-crops of all kinds growing on the wind-swept land vanished from existence. Ruin has been spread over the greater part of two-thirds of the island—many square miles of what had been richly-cropped soil had become a waste, and on the evening of the day following the outburst thousands of people were rendered aimless and homeless on a desert—for to such a pass had the beautiful land come. The United Fruit Company is probably the largest sufferer, in a loss which is estimated at £2,000,000. It is worthy of note that efforts at reparation, aided from this side, have already been begun, but it will be long before there can be any Banana "prospects" to record—it will be very much longer ere this last terrible disaster will be forgotten.

HOME CORRESPONDENCE.

THE NAMES OF PLANTS.—Mr. C. Wolley Dod's question, "Will any objector tell us why Kew is wrong?" assumes that Kew is wrong. From the point of view of saving time and trouble, the practice adopted by Kew is usually considered by ordinary editors as the most convenient. Unless an editor is a botanist, it involves a considerable waste of time to hunt up the *Index Kewensis* to see whether initial capitals are used or not; and when the *Kew Hand-Lists* differ from that work, he may well be excused if he adopts a simple rule. In non-botanical works such a rule is excusable, but in botanical works surely anything within reason that helps the botanist to remember the meaning of the name should be utilised. This is especially necessary for teaching purposes. There is classical authority (*Cæsar, De Bello Gallico*) for using capital initial letters for adjectival forms of proper names, whether of persons or countries; and it is far simpler to use a capital wherever a proper name is utilised, whether as a noun or adjective, than to see Lindley or Hooker's name spelt in one place with a capital and in another with an ordinary letter; to employ italics for all old generic names used as specific, and to use inverted commas for unaltered native or vernacular names, e.g., *Rhamnus Frangula*, *Cestrum "Parqui"*. It is true that Linnaeus and some of his predecessors generally used small letters for adjectival forms of geographical names, but the rule was apparently no more strictly adhered to than the termination "aceæ" is for Natural Orders in Bentham's and Hooker's *Genera Plantarum*. Linnaeus, however, seems to have had an aim that is often lost sight of by modern botanists, viz., to leave no doubt as to the plant intended; he even sacrificed his rules occasionally on that account, as is evident in such names as *Asplenium Rutamuraria* and *Adiantum Capillus Veneris*. For the same reason, one rarely finds a Linnæan specific name (which should preferably be descriptive of a peculiarity of the species) derived from the name of a person. The enormous increase of both specific and generic names since his time renders it still more necessary to lessen the tax on

memory by the adoption of simple rules whereby the name may be more easily remembered by its meaning being understood. I have adopted the plan of using capital initial letters for all proper names, whether nominal or adjectival, and have, as yet, found no disadvantage, but, on the other hand, considerable utility in doing so. There are so many names of little-known places in foreign countries used as adjectival specific names, such as *caripensis*, *ardonensis*, &c., or names altered in form, such as *tabrisiana*, that without an initial capital the meaning of the name is not readily apparent. A curious instance of this occurs in the name *Citrus Medica*, which if spelt with an initial "m" means the Citron medicinal, although it properly means the Citron of the Medes. *E. M. Holmes*.

POA ANNUA.—I quite agree with Mr. Webster and others that this is a very valuable grass for town gardens. It seeds more freely and persistently than any other grass I know of; in fact, from early spring to Christmas, provided the season is mild, it is engaged in the work of reproduction. I should say it must be a difficult matter to save the seed in quantity, as it ripens so very gradually. Here, in Factory-land, I have found it to withstand the fogs and atmospheric impurities, where other grasses have perished during the winter months; and, further, it maintains its verdure underneath large trees. Drought very quickly affects it; but generally speaking there is plenty of water in London gardens and parks, so that difficulty is easily overcome. We laid out a disused churchyard last winter as a recreation-ground. It was not intended to sow the grass-plots until next spring. A tremendous crop of this grass, however, came up, and as it was allowed to seed until the end of June, we shall have good lawns next season without further trouble. I may say that the grave-mounds were levelled down some years ago, and I take it quantities of the seed must have been buried too deep to germinate, and that in trenching last winter it was brought near the surface. *Walter H. Aggett, Bermondsey, S.E.*

SAMBOOS FLOWERING.—Mr. Burbidge has somewhat misunderstood my communication to him on the flowering and seeding of hardy Bamboos. The only Bamboos that so far have produced seed with me are *Arundinaria Simeni* and *A. Laydekeri*. *Phyllostachys nigra* and *P. nigra v. nigre-punctata* flowered profusely with me last season and the season before, but no seed was observed, although careful search was made. Other Bamboos which have flowered in Europe are *Phyllostachys flexuosa*, *Arundinaria japonica* (*Métaké*), and *A. auriconia*; none of these died, though they were considerably weakened. *Arundinaria Simeni* and *A. Laydekeri* do not suffer in appearance from the effort of flowering. The individual culms wither, but the clumps as a whole are not affected. *Redesdale*.

FLOWERING OF CABBAGES.—I have been interested in your seed trade forecast of the seed crops. Under the heading of Brassicas your correspondent is evidently at sea. The reason for the shortage in Cabbage is not because "the Cabbages planted out for seed bolted into flower in spring so numerous," but the very opposite—that is, the Cabbages planted out for seed have failed to bolt and flower. I think any practical seed-grower will bear out this statement. My Cabbage-seed crops of various sorts this year covered over 70 acres, and in no case is there an average run; of some sorts not one plant in fifty has run for seed. *William Deal, junr., F.R.H.S., Kelvedon*.

THE WET SUMMER AND THE GROWTH OF CONIFERS AT DROPMORE.—The abundant rainfall of the present season has been most beneficial to all Coniferous-trees, and in the light soil at Dropmore Conifers have made strong growths, vigorous young specimens of *Cupressus macrocarpa lutea* having in some instances made leaders 2 feet in length, which are still growing. This golden-foliaged *Cupressus* forms a fine ornamental tree for garden decoration. *Cedrus Deodara alba spica* promises to grow into a very ornamental tree the points of the young shoots are creamy-white—a good tree for grouping or

forming an avenue. Some measurements of the finest specimen Conifers here taken recently may be of interest to your readers:—

	Height.	Girth at 5 feet.
<i>Picea rubra</i>	95 ft. 6 ins.	5 ft. 6 ins.
<i>Abies cephalonica</i>	86 ft. ...	8 ft. 5 ins.
<i>Tsuga Mertensiana</i>	76 ft. ...	6 ft. —
<i>Pseudo-tsuga Douglasii</i>	127 ft.* ...	11 ft. 6 ins.
<i>Cedrus libani</i>	109 ft. ...	12 ft. 2 ins.
„ <i>Deodara</i>	102 ft. ...	8 ft. 5 ins.
„ <i>atlantica glauca</i>	78 ft. ...	7 ft. 2 ins.

* The top droops and would if erect measure another 3 feet. † Carrying cones.

These measurements were taken with a dendrometer. *Chas. Page, Dropmore Gardens, Maidenhead, Bucks.*

MANURES FOR GRASS-LAND.—I have read with much interest the results of experimental manure on grass by your correspondent, Mr. J. J. Willis, Harpenden, and should be glad if he would be good enough to state the quantity of sulphate of potash, soda, magnesia, superphosphates, &c., when applied, or if used in conjunction with animal manure; also the commercial names and price and value per acre; it would then be valuable to our neighbouring farmers, &c. *John Pope, King's Norton, near Birmingham.*

Mr. Willis, to whom we sent the above note, obligingly writes:—

"The Rothamsted experiments on grass-land were arranged to teach certain agricultural lessons, and not for the practical farmer to follow in all their detail. For general pasture purposes it may be said that a dressing of from 8 to 10 tons of farmyard-manure per acre may be applied once in every four or five years. Then to keep up the quality of the herbage use 5 cwt. of basic slag with 3 cwt. of kainit per acre. These may be applied every other year, and put on as early in January as the weather permits.

"If the land is deficient in humus (organic matter, superphosphate of say 30 per cent. soluble phosphate, at the rate of 3 cwt. per acre, should be used instead of the basic slag. Bone-meal, at the rate of 4 cwt. per acre every other year, is also a capital manure for meadow-lands; kainit may be mixed with this. If the land has been grazed by farm-stock and requires sweetening, apply chalk-lime (ground) at the rate of $\frac{1}{2}$ ton per acre, in addition to the foregoing mixtures. This may be put on any time from November to January.

"Should it be desired to cut the crop for hay, apply in March each year from $\frac{1}{2}$ to 1 cwt. of nitrate of soda per acre, just to give a stimulus. But do not exceed this amount, otherwise the finer Grasses and Clovers will be forced out, and the coarsely-growing species will be too greatly encouraged. It may be mentioned that basic-slag is better than superphosphate for wet meadows. The present wholesale prices of the manures mentioned are as follows:—Nitrate of soda, £10 per ton; bone-meal, £5 per ton; kainit, containing 23 per cent. of potash, £2 10s. per ton; basic-slag of 38 to 45 per cent. phosphate, £2 5s. per ton. Superphosphates vary in price according to the proportion of phosphate made soluble; the higher grades are always to be preferred. *J. J. Willis, Harpenden.*

THE FLAVOUR OF THE SULTANIEH GRAPE.—In the *Gardeners' Chronicle* of August 8, p. 104, there is the report of the Fruit Committee on the Sultanieh seedless Grape. It runs thus:—"Rose-coloured, transparent Grape, with delicate bloom, but not much flavour." Yet others who tried it after the Committee had given judgment on it declared that it was of good flavour, and one connoisseur declared it "very delicious." Now, what can be the cause of this discrepancy? I had noticed that the judges previously had before them the Peach Libra, and had eaten small slices of this Peach in order to ascertain its flavour. I believe this is the explanation of the discrepancy alluded to. There was not time enough for their palates to re-acquire a neutral condition after having been impressed by the flavour of the Peach, and so the flavour of the Sultanieh Grape was considered insufficient. Perhaps a somewhat similar phenomenon occurred to myself recently. The flavour of the Cape Gooseberry (*Physalis peruviana*) is unique; it is distinct, and very agreeable; yet this is what happened:—I had been eating some Strawberry Grapes,

the flavour of which is strong, distinct, and very nice. After them I tried some Cape Gooseberries, and was disappointed with their flavour; they were almost flavourless! Anybody can make the following experiment. Drink a little claret of a brand preferred for its fine flavour, then eat some caviare on a bit of toast, and after having swallowed it drink a little more claret, it will be found that the same wine highly approved of before has now become a nasty compound! In my tasting experiences I found sherry is the proper wine after caviare. Suppose the judging committee had to decide at one-sitting on the qualities and flavour values of Peaches, Grapes, Melons, Apples, &c., the chances are that they would unconsciously deliver an erroneous judgment, excepting on the first fruit-tasted, for the risk of their palates becoming vitiated by the flavour of the fruit previously tasted is, I think, not small. Perhaps I may be permitted to suggest that the Royal Horticultural Society on such occasions should provide a plate of Olives, so that the impression of the flavour of one kind of fruit may be wiped out by that of an Olive; for there is nothing that cleans the palate so well as an Olive. If some object to Olives, then bread-and-cheese (preferably Roquefort) might have a similar effect. The other alternative would be to allow a certain interval to elapse after the tasting of each fruit, so as to admit of the palate regaining its normal neutrality; but this is not practicable, for it would take up too much of the Committee's time. In judging of the colour of flowers, one would avoid using tinted glass-spectacles; so, in judging of flavours, one requires some care not to misjudge them, owing to palate-impressions of previous fruits. This discussion raises an interesting question. Does the smoking of tobacco, before giving judgment on a flavour, interfere with the pronouncing a right judgment? This can only be ascertained by a series of experiments made by the same person, for different persons might be a source of confusion in the result. I believe tea-tasters are very careful to allow a long rest to their palates before they undertake the work of their profession. This physiological question may possibly be of some importance. Market gardeners, and also amateurs, rely on the verdict of the Fruit Committee when a new fruit is submitted to their expert judgment. And if a horticulturist was enterprising enough to try a new fruit, he might think it waste of time to try a tree that produced fruit which had "not much flavour." I tried this Grape when I had a clean palate, and gave some to another person to try who had also a clean palate, and we both came to the conclusion that the Sultanieh Grape is "simply delicious." *E. Bonavia, M.D.*

SPORTING OF CARNATIONS.—The note on a Carnation sporting induced me to record the most remarkable case of that kind that has come under my notice, and which occurred only a week or two ago. I had cuttings of several continental Carnations sent me a few years ago, some of which are desirable varieties, others obviously not far removed from types of the sixteenth century. One of the latter, a yellow ground with stripes, sported to a pure white ground, but with no alteration in the markings, the same plant bearing a self-coloured bloom at the same time. Is there any other instance of a Carnation sporting in this way; and is it any indication that the yellow grounds originated from a white variety? I suppose not. While on the subject of sports I may say that *Verbena Miss E. Willmott* sported with me to a lovely deep rose colour. Has this happened with others? I mentioned the matter to the raiser the last time I met her, but it was new to her. A very curious case of reversion happened here some years ago to a variegated *Ficus elastica*, one-half of the plant retaining its characteristic variegation, while the other half is green, the lines of demarcation being apparent even to portions of the leaves. If it had been confined to leaves issuing, one kind from one half of the stem, and one half from the other, that would have been notable, but a leaf springing from either portion, if it passes beyond the median line, acquires and retains either the self-green of the one or the bleached yellow of the other side is still more remarkable. *E. P. Brotherston*.

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 18.—On this occasion the Drill Hall, Buckingham Gate, was unusually gay with Gladiolus, Hollyhocks, Begonias, hardy herbaceous perennials and Dahlias.

Floral Committee.

Present: H. B. May, Esq. (in the Chair), and Messrs. C. T. Druery, G. Nicholson, R. Dean, J. Jennings, Howe, G. Reuthe, C. Dixon, C. Jeffries, J. W. Barr, C. E. Pearson, R. C. Notcutt, W. Cuthbertson, H. J. Jones, C. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, G. Paul and A. Perry.

Messrs. PAUL & SON, The Old Nurseries, Cheshunt,

The same firm showed several cut specimens of hardy shrubs, as, for instance, *Colutea melanocephala*, a species having orange coloured flowers; *C. arborescens*, *C. cruenta*, with brown and yellow flowers; *Ailanthus glandulosa pendulifolia*, with very large and massive-looking leaves, with a leaf-stalk tinged with brown on the upper side; *Carpinus purpurea*, the younger leaves of which have a reddish-brown tinge; *Betula aurea*, whose young leaves have a yellowish

FIG. 53.—CALOCHORTUS PULCHELLUS. (SEE P. 133.)

Orchids were more numerous than at the last two meetings, many choice species and varieties, both old and new, being exhibited; and some well-grown and finely-flowered Bouvardias heralded the approach of autumn.

A rather numerous company visited the Hall.

N. exhibited shrubby Phloxes in variety, including Coquelicot (crimson), La Siede (rosy-purple), Iris (purple, of a rich tint), Evenement (cerise), Caron d'Ache (crimson-lake), Cyrano (purple and white), and Fiancéé. Sprigs of Statice were stuck in between the vases.

tint; *Catalpa purpurea*, the young leaves purple of a deep tint; *Fagus Zlatia*, the foliage of which at the ends of the shoots is of a yellow tint; shoots of *Fyrus Sorbus* in fruit, *Betula pyramidalis*, with wavy, deeply dentate foliage, very distinct.

Messrs. JOHN PEED & SON, West Norwood, S.E

showed cut flowers of hardy herbaceous perennials, &c., which included Phloxes, Chrysanthemum maximum, Helianthus, Statice, Echinops ruthenicus, with steely-coloured, round flower-heads; Montbretias in variety, and a few Michaelmas Daisies. Besides these, there were in show-boxes of soil covered with pieces of rock a large number of Alpine plants, in and out of flower.

Messrs. J. CHEAL & SONS, Lowfield, Crawley, showed in zinc tubes placed in big show-boxes topped with live moss, single flowered varieties of Dahlias, of which we may mention as attractive in colouring Miss Morland, Madge, Meta, The Sirdar, Columbine, Irene, Cleopatra, &c.; Cactus Dahlias of the convolute or thread-petalled type, Galliard, Theodora, Ajax, J. W. Wilkinson, Eva, Columbia, T. H. Jackson, W. Jowitz, Lyric, Vesta, and Mrs. de Luca. There were likewise about a dozen varieties of Pompons (Silver Banksian Medal).

Messrs. J. VEITCH & SONS, Ltd., Royal Exotic Nursery, Chelsea, S.W., showed again the showy Senecio clivorum; several tubfuls of Watsonia Arderonii, having slender stems rising to a height of from 3 to 5 feet, surmounted with spikes of pure white flowers; Astilbe Davidi, having tall spikes of purple-coloured inflorescences; enormous flower-heads of Sambucus canadensis; Streptocarpus (Veitch's hybrids), having pretty shades of colour, and flowers in some cases larger than one usually sees, especially large and showy being those of the Achimenesiflora strain. The seed was sown in January, and the plants came into flower in six months (Silver Flora Medal).

Messrs. H. & G. BULLINGTON, Nurserymen, Matlock Bank, showed Carnation The Duchess, a large flower of a light pink tint, and possessing a good calyx.

Messrs. R. VEITCH & SON, Royal Exotic Nursery, Exeter, showed shoots of Coriaria terminalis, having yellow fleshy fruits of the shape of those of the Yew, and pinnate leaves 8 inches in length and 3 inches in width. They showed likewise Aster canescens, Chrysopsis variety Rutleri (a yellow Composite), Fagus Zlatia, the Golden Beech.

Herr W. PRITZER, Stuttgart, exhibited (through Mr. G. SCHNEIDER, 17, Ifield Road, Fulham Road, S.W., his agent in this country) some extraordinarily fine varieties of tuberous-rooted, single-flowered Begonias of much substance and large size, having frilled edges like those of Primula sinensis, the frilling running entirely round each petal and giving the flowers an unusually attractive appearance. There were pink, yellow, crimson, and scarlet-coloured varieties. Herr Pritzer also showed Begonia Bavaria of the floribunda type, rose-crimson in colour, for which he received an Award of Merit.

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, showed Hydrangea japonica variegata, a white variety of Plumbago capensis, Campanula isophylla, Swansonia galegifolia alba, Solanum jasminoides, nicely flowered; Nerium Oleander rosea splendens, and N. O. r. s. variegata, with telling leaf variegation of creamy white. He showed besides these many plants of Bouvardias in a variety of colours, most of which were capitis bloomed; Paneratum fragrans, &c. The flowering plants were agreeably set off by numerous small Ferns (Silver-gilt Flora Medal).

Mr. E. POTTEN, Camden Nurseries, Cranbrook, Kent, exhibited various hardy perennial herbaceous plants, including Trollius europensis improved, a floriferous plant with flowers of a bright yellow tint; Phloxes of the shrubby type, Buddleia variabilis, Potentilla Hopwoodensis, Montbretias, including the fine large crimson Germania; Ceanothus, Tritomas, Helianthus, Heleniums, Veronica rosea, and a fine lot of flower spikes of Penstemons (Silver Banksian Medal).

Mr. AMOS PERRY, Hardy Plant Farm, Winchmore Hill, London, N., showed a very imposing group of hardy herbaceous perennials as cut flowers. Among these were Lythrum roseum superbum; many choice varieties of shrubby Phloxes; Veronica spicata alba and the type; Heleniums, Bocconia cordata, a white-flowered Monarda didyma, Chrysanthemum maximum Mrs. Head, various Hemerocallis, Chelone glabra, Tritomas, Clematis integrifolia, Campanula Mariesi, plants of Fuchsia globosa in bloom, Geum Heldreichi var. superba, with brilliant orange-scarlet coloured flowers (Silver Banksian Medal).

Mr. B. LADHAMS, Nurseryman, Shirley, Southampton, showed some beautiful Gaillardias of the oculata types, all having been raised from G. grandiflora. Other of his exhibits were the perpetual Pinks, Mrs. Moulard, Florence, and Marion; Chrysanthemum maximum var. Monarch (a fine showy flower); the hardy hybrid Lobelia Andrew Barlow (having a good risp of purple-

coloured flowers); Geum "Apricot," and Hellopsis B. Ladhams (Silver Banksian Medal).

Messrs. BARR & SONS, King Street, Covent Garden, showed extensively Hardy herbaceous perennials, including many Gladiolus mentioned in another part of our report; Violas in variety, including the striking variety Sunset; Campanulas, shrubby Phloxes in many fine varieties, Montbretias (very fine), Kniphofias, Wachendorfia paniculata, Lilies, Alstromerias, Trollius, Water Lilies, a few Scabiosas, Lythrum, Miscanthus chinensis and M. zebrina, strong-growing grasses, good for planting near water; a new Campanula carpatica named China Cup, much stronger in growth and larger flowers than the type (Silver Flora Medal).

Hollyhock.—It was satisfactory to see this fine old florist's flower shown so numerous and in such good character; the fine collection shown by Messrs. WEBB & BRAND, the successors of the veteran William Chater, of Saffron Walden, furnished evidence that the Hollyhock is getting back to its pristine vigour, and recovering from the effects of the fungus which during the past thirty years destroyed so many collections. There were eighteen fine spikes of varied colours, and 144 cut blooms, all of good quality, showing substantial improvement in the flower which is highly satisfactory (Silver-gilt Banksian Medal).

Gladiolus.—A magnificent collection of spikes of bloom numbering 250 were staged by Messrs. KELWAY & SON, Langport, Somerset. The fine quality of all was a proof that the wet summer had not affected the development of the Gladiolus at Langport. The darkest in colour, shades of deep crimson to maroon, were Lucius, Wellington, Mike Lambrow, Shahzada, The Sultan, Western Glory, Sir Evelyn Wood (very fine), Maharajah of Kolhapur, &c.; shades of crimson and scarlet with rosy-scarlet were seen in Lord Iddesleigh, John Warren, Earl Cadogan, Colossal, Arthur Toms, F. Field, Marcianus, Duke of Devonshire, Lord Rothschild, E. J. Lowe, Tros (very fine), W. Hobhouse, Lord Methuen, General Buller, Marchand, Sunshine, Cellini &c. Shades of purple are scarce, the few varieties showing this colour were Captain Kelway (a fine new variety), Lord Hawke, and Persimmon; of rose and deep pink shades some of the finest were Langport Wonder, Cervantes, Meteor, Calliphon, Winnie Talbot, Ontario, and Shirley Hibberd; of delicate tinted varieties, soft-pink, blush, and cream, there were Mrs. Foster, Numa, Gribon, Mrs. T. Field, Miss Monro, Appianus, Egeria, Princess Royal, Shakespeare, Sarah Bernhardt, Philon, and Richard Milson (Silver-gilt Flora Medal).

Baron SCHROEDER, The Dell, Egham (gr., Mr. Ballantine), had a small but interesting collection of Canadian hybrids which appeared to possess the blood of Gandavensis, Lemoinei, Nanceanus, and Childsii. In colour they ranged from cream through yellow to dark crimson and purple; the flowers finely formed and generally with large dark throat blotches (Silver Flora Medal awarded by the Council).

Mr. W. C. BULL, Rathlin, Ramsgate, sent a small collection showing much individuality of character, the flowers more rounded in form in some of them than is usually seen, and having the colour usually found on the throat segment confined to the bottom of the open throat. Nymph, a very fine white with a yellow flame; Sulphureus, pale yellow; Phyllis, blush tipped purple, were the best (Award of Merit).

Messrs. CHAMPION & Co., Old Street, St. Luke's, showed a number of superior-finished plant-tubs, in round, square, and triangular forms.

Awards.

AWARDS OF MERIT.

Gladiolus Lady Muriel Digby.—Primrose, with a yellow stain on the throat and crimson markings; a large-flowered variety, forming a bold spike. Messrs. KELWAY & SON, Langport.

Gladiolus Nymph.—A large white variety, with rounded segments and a stain of yellow on the lower, with a disc of colour at the base of the open throat. Mr. W. C. BULL, Rathlin, Ramsgate.

Tamarix odessana.—A shrub with fine foliage and long pinkish inflorescence.

Orchid Committee.

Present: Henry Little, Esq. (in the Chair); and Messrs. James O'Brien (Hon. Sec.), W. Cobb, H. M. Pollett, J. Douglas, F. Wellesley, G. F. Moore, H. Ballantine, H. T. Pitt, W. Boxall, F. J. Thorne, H. A. Tracy, W. H. White, W. H. Young, and T. W. Bond.

Several excellent groups were staged, the number of hybrid Orchids included being specially interesting.

Captain G. L. HOLFORD, C.I.E., Westonbirt, Tetbury (gr., Mr. Alexander), was awarded a Silver Flora Medal for a fine group of superbly-grown Orchids, the specimen of *Laelio-Cattleya* × *callistoglossa excelsa* (for which his grower was accorded a Cultural Commendation) being a marvellously fine exhibit. Also in the group were good *L.-C.* × *Bletchleyensis*, *L.-C.* × *eximia*, *Cattleya* × *Germania superba*, with a grand head of bloom; the handsome *C.* × *Pittiana* (*Schofieldiana* × *aurea*), *C.* × *Fernand Denis*, *C.* × *intricata*, and a noble example of *Vanda cœrulea* with a spike of eighteen flowers.

Messrs. CHARLESWORTH & Co., Heaton, Bradford, secured a Silver Flora Medal for a good group, the novelties in which were *Cattleya* × *Ceres* (*Schilleriana* × *Luddemanniana*), a pretty hybrid with whitish sepals and petals and large labellum like a fine *C. Schilleriana*; *Laelio-Cattleya* × *luminosa aurifera*, with golden-yellow sepals and petals; and *Rodriguezia grandis*, provisionally named (? R. Batemani), a very remarkable species with large whitish flowers, striped and tinged with lilac. In the group also were *Cattleya* × *Iris Fascinator*, *C.* × *Niobe*, *Laelio-Cattleya* × *Bletchleyensis*, *L.-C.* × *Adolphus*, the rich reddish-scarlet *Sophr-Cattleya* × *heatoniensis*, *Lælia* × *Iona superba*, *Stanhopea oculata*, *Brassia Lawrenceana*, *Odontoglossum* × *crocidipterum*, *Catasetum callosum*, *Masdevallia* × *McVittiae*, *M.* × *Pourbaixii*, *Platyclinis filiformis*, &c.

H. T. PITT, Esq., Rosslyd, Stamford Hill (gr., Mr. Thurgood), received a Silver Flora Medal for a fine group, which included a very good *Odontoglossum*, and notably a variety of *O. crispum*, which had the sepals and labellum nearly covered with red purple blotches. Also noteworthy were *Bollea cœlestis*, *Odontoglossum Uro-Skinneri album*, *Cattleya* × *Atalanta*, *C. Gaskelliana albens*, *Laelio-Cattleya* × *Mrs. Pitt*, *L.-C.* × *elegans*, *L.-C.* × *Nysa*, the new and pretty *L.-C.* × *Constance Wigan*, *Lælia monophylla*, the delicately coloured *Cypripedium* × *Felicity*, *C.* × *Wiertzianum*, *Aëranthes carphophorus*, &c.

Messrs. SANDER & SONS, St. Albans, had a select group, including the fine *Cypripedium* × *Utor*, *C.* × *Cassandra*, and other *Cypripediums*; *Phaius maculatus*, varieties of *Laelio-Cattleya* × *Bletchleyensis*, and other *Laelio-Cattleyas*; *Miltonia vexillaria superba*, the pretty *Pachystoma Thompsonianum*, and other interesting species (Silver Flora Medal).

Messrs. STANLEY, ASHTON & Co., Southgate, had an excellent group, the central figure of which was the richly-coloured *Lælia* × *Iona* Southgate variety, which took the only Award of Merit of the day. Also noted in the group were *Lælia* × *Amanda*, *Cattleya* × *F. W. Wigan*, forms of *C. Loddigesii*, *Cypripedium* × *Carnusianum*, and other *Cypripediums*; *Oncidium* × *Mantini*, the handsome yellow-and-brown *O. Forbesii* *Borwickianum*, *O. incurvum album*, &c. (Silver Flora Medal).

JEREMIAH COLMAN, Esq., Gattopark (gr., Mr. W. P. Bound), sent a singular variety of *Laelio-Cattleya* × *elegans* with a narrow elongated front lobe to the lip.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr., Mr. Hopkins), sent *Cypripedium* × *Wiertzianum*, *Bleu's* variety; *Laelio-Cattleya* × *Herman Holmes superba*, and *Lælia* × *Olivia alba*, differing from the original in having white sepals and petals instead of yellow ones.

C. J. LUCAS, Esq., Warnham Court (gr., Mr. G. Duncan), sent *Laelio-Cattleya Bletchleyensis* and *Cypripedium* × *Lord Derby*.

FRED. HARDY, Esq., Tyntesfield, Ashton-on-Mersey (gr., Mr. T. Stafford), sent the handsome *Sophr-Cattleya* × *George Hardy* (*S. grandiflora* × *C. Acklandiae*), a distinct flower of an Indian yellow tint, flushed and spotted with purple. It had previously received an Award of Merit.

J. BRADSHAW, Esq., The Grange, Southgate (gr., Mr. Whitelegge) showed *Cattleya* × *Comet* (*Warneri* × *aurea*), with purplish-rose sepals and petals, and velvety-purple lip with a yellow base.

W. M. APPLETON, Esq., Weston-super-Mare, showed *Cypripedium* × *Rolfeae*, Appleton's variety; *C.* × *Phœbe*, and *C.* × *Bingleyense*. C. L. N. INGRAM, Esq., Elstead, Godalming (gr., Mr. T. W. Bard), sent *Laelio-Cattleya* × *Epicasta fulgens* (*C. Warszewiczii* × *L. Dayana*), and *L.-C.* × *Meteor* (*L. Dayana* × *C. Bowringiana*).

Awards.

AWARD OF MERIT.

Lælia × *Iona*, Southgate variety (*Dayana* × *tenebrosa*), from Messrs. STANLEY, ASHTON & Co., Southgate. No hybrid of this cross had previously found favour with the Committee, but the Southgate variety, a finely-

formed and richly-coloured flower, was much appreciated. The two-flowered spike had perfectly formed flowers, with sepals and petals of a purplish-rose the circular-fronted labellum being of a glowing dark ruby-purple colour, with claret veining from the base.

CULTURAL COMMENDATION.

To Mr. George Matthews, gr. to Lord AUCKLAND, Kitley, Plymouth, for a fine spike of *Oncidium luridum guttatum*, 7 feet 6 inches in length, and bearing 230 flowers.

To Mr. Alexander, Orchid-grower to Captain G. L. HOLFORD, for a grand specimen of *Laelio-Cattleya* × *Callistoglossa excelsa*, with twelve flowers.

Fruit and Vegetable Committee.

Present: Mr. G. Bunyard, in the chair; also Messrs. H. Balderson, J. Cheal, W. Bates, H. Esling, A. Dean, J. Barham, G. Help, H. Markham, Owen Thomas, J. H. Veitch, J. Jaques, J. Willard, G. Wythes, F. Q. Lane, and C. G. Nix.

Mr. G. WYTHES, Syon House Gardens, sent two seedling scarlet-flesh Melons, neither fully ripe; one, however, had remarkably thick, smooth, rich-coloured flesh; it was to be seen again when riper. There also came from the same exhibitor two Vegetable-Marrows, one long and white, the other pear-shaped, the products of crossing the Turk's-cap with the Custard Marrow. He was asked to send fruits to be cooked with other varieties at Chiswick on Monday next.

Mr. H. PARR sent from Trent Park Gardens, Barnet, a couple of long green Marrows of the bush variety; also a box of over-large Tomatoes of the variety named "Coronation." Plants of this are now being grown at Chiswick. Mr. W. J. STAPLES, gr. to DE BARY CRAWSHAY, Esq., Rosefield, Sevenoaks, had a couple of curved Cucumbers.

Messrs. T. RIVERS & SONS, Sawbridgeworth, exhibited handsome rich-coloured but over-ripe fruits of their new mid-season Peach "Peregrine," of good flavour (Award of Merit). From Mr. J. BOWERMAN, Hackwood Park Gardens, Basingstoke, came a quantity of pods and clusters of a superb Scarlet Runner Bean named "Hackwood Success." Not only is the variety most prolific, but the pods are long and straight, averaging 12 inches in length (Award of Merit).

The Rev. G. F. EYRE ROCK, Worcestershire, sent pods of a fine Pea, The Logan, which closely resembles Sutton's Exhibition Marrow and other varieties. Asked to send seeds to Chiswick next year.

Mr. G. KENT, Norbury Park Gardens, Dorking, sent a bunch of a seedling Grape, no information being given as to parentage. The berries were of great size, oval in shape, black and very fleshy, and apparently of excellent flavour, but not yet ripe. He was desired to show it again in a month.

Mr. J. HUDSON, gr. to LEOPOLD DE ROTHSCHILD, Esq., had a dish of very fine fruit of Royal Sovereign Strawberry, gathered out-of-doors from forced plants put out in the spring.

CULTURAL COMMENDATION.

Messrs. SPOONER & SONS, Hounslow, put up a fine collection of Apples, from their Nurseries, all grown out-of-doors, where, for a wonder, they seem to have a great crop. They were chiefly shown in baskets and boxes. Of those most noteworthy were Lady Sudeley, Pott's Seedling, Lord Grosvenor, Nonsuch, Beauty of Bath, Red Astrachan, Red Quarrenden, Stirling Castle, Frogmore Prolific, Grenadier, and Worcester Pearmain (Silver-gilt Knightian Medal).

From Messrs. DONNIE & SONS, Rothesay, came (grown at their Kentish nursery, Orpington) a very attractive, handsome, and clean collection of twenty-five varieties of Potatoes, in baskets of about sixty tubers each. Of whites, very fine were Duke of York, White Beauty of Hebron, Ringleader, Windsor Castle, Sharpe's Victor, Sir J. Llewellyn, Sutton's A 1, The Factor, British Queen, British Premier, and Alpha. Of coloured varieties, excellent were Crimson Beauty, White Elephant, Eightyfold, Mr. Breesee, and Lord Beaconsfield (Silver-gilt Knightian Medal).

TAUNTON DEANE HORTICULTURAL.

AUGUST 13.—This was the thirty-sixth annual exhibition of the Taunton Deane Horticultural Society that succeeds one that was in operation in the town fifty years ago, and which held three exhibitions each summer. The exhibition on the 13th inst. surpassed in extent, and in many respects in quality, any previous one. There was not only a substantial increase in the number of exhibitors, but a large one in the number of entries. One very large tent was set apart

for the classes open to all, and it was most inconveniently crowded; though in previous years it had proved amply sufficient. In the division open to amateurs and gardeners, arranged in another very large tent, there was the same crowding. A supplementary tent was filled with groups and some specimen plants; another, considerably enlarged, accommodated floral decorations; the "open-to-all" fruit and vegetables filled another large tent; another had the cottagers' productions; another, honey.

The task of judging was an onerous one, but the admirable arrangements made by the secretary, Mr. J. S. Winsor, greatly facilitated the work of the judges, and enabled the tents to be thrown open at the advertised time. One very interesting feature was the two classes for British wild flowers: one was for twenty-four species, collected by the exhibitor in Somerset and Devon; the other for the same number, collected in the same counties between April 1, 1903, and the day of exhibition—in the latter case dried and mounted, but in both cases labelled in full with their Latin and common names and natural order, according to the *Student's Flora*, by Sir J. D. Hooker. The judges of these—the Rev. Prebendary Smith, East Brent, and Dr. H. J. Allford, of Taunton—spoke in the highest terms of appreciation of the exhibits in these two classes.

In the "Open-to-all" tent, stove and greenhouse plants in collections of twelve, all in flower, made a very fine display, Messrs. JAMES CYPHER & SONS, Queen's Road Nursery, Cheltenham, taking the 1st prize with very large examples of *Statice intermedia* and *Stephanotis floribunda*, *Bougainvillea Sanderiana*, and having also examples of *Ixora macrothyrsa*, *Allamanda nobilis*, *Bougainvillea glabra*, &c. Mr. W. VAUSE, nurseryman, Leamington, was in strong force, showing admirable specimens, and took the 2nd prize, and very closely up too, with two very fine specimen *Ericas*, *Ixoras Williamsii* and *I. Pilgrimi*, *Allamanda Hendersoni*, &c. W. MARSHALL, Esq., Taunton (gr. W. Thomas), who had a finely grown collection, was 3rd; and the judges recommended that an extra prize should be given to Mr. GEO. TUCKER, nurseryman, Hilperton, who put up very good twelve specimens. With six plants Messrs. CYPHER & SONS were again 1st, having finely developed plants; Mr. W. VAUSE was 2nd; and Mr. W. BROCK, Exeter (gr., W. Rowland), 3rd.

There were several classes for specimen plants, stove and greenhouse, and soft-wooded, in which good examples were staged. A very good specimen of *Physianthus albens*, trained over a balloon trellis, well grown and flowered, appeared among the greenhouse plants. Messrs. CYPHER & SONS were also 1st with eight fine foliage plants, and Mr. W. VAUSE, 2nd.

Mr. W. BROCK had the best eight exotic Ferns, staging fine specimens; and Mr. G. TUCKER came 2nd with well-balanced examples.

GROUPS OF PLANTS

arranged for effect formed a fitting centre to one tent. In the Open division Mr. W. VAUSE was 1st; Mr. W. BROCK, 2nd; and Messrs. E. S. COLE & SON, nurserymen, Bath, 3rd.

In the Amateurs' division Mr. BROCK was 1st; and Colonel SANDFORD, Wellington (S. Kidley, gr.), 2nd.

Tuberous Begonias were in the form of fine specimens. Mr. W. MARSHALL was 1st, and Mr. G. TUCKER, 2nd. Some good specimen single and double Zonal *Pelargoniums* were staged, also *Fuchsias* in fours; there were some very good *Cockscombs* also.

Messrs. CYPHER & SONS were the only exhibitors of four *Orchids*, staging well-bloomed examples.

STOVE AND GREENHOUSE PLANTS.

Some very good specimens of stove and greenhouse plants were staged by amateurs. The best twelve, which included foliage plants, came from Mr. MARSHALL; Mr. BROCK being 2nd.

Mr. BROCK had the best six, and also the best four; Colonel SANDFORD coming 2nd in both classes.

Colonel the Hon. H. P. GORE-LANTON, Hatch Beauchamp (W. H. Bruford, gr.), came 1st with six fine exotic Ferns; and Mr. H. S. BAILY, 2nd; the latter being the only exhibitor of four *Orchids*, which received the 1st prize.

Some excellent *Lilies* in pots were shown by Mr. W. MARSHALL, varieties of *L. auratum* and *L. speciosum*. Specimens of *L. auratum* were good also; the best came from Mr. W. W. BAKER, Bridgwater, who was 1st with six single tuberous *Begonias*; and Mr. W. MARSHALL 1st with six double, both very good.

Zonal *Pelargoniums* in sixes, single and double; *Coleus*, very well coloured; *Gloxinias*, the best coming from Mr. MARSHALL. There were very good plants of *Achimenes*, the best from Mr. W. J. VILLAR. Good *Petunias* were also staged; also *Caladiums* and *Cockscombs*.

CUT FLOWERS

are always a strong feature at Taunton. In the Open division Messrs. PERRINS & SON, Nurserymen, Coventry, had the best thirty-six cut Roses; Messrs. J. TOWNSEND & SON, Worcester, were 2nd. With eighteen blooms, Messrs. PERKINS & SON were again 1st, and Messrs. JARMAN & Co., Chard, 2nd. Mr. H. CORDER, Bridgwater, had the best twelve Teas; Messrs. J.

TOWNSEND & SONS were 2nd. The Roses generally were fairly good.

Messrs. J. CRAY & SONS, Frome, came 1st with a dozen very good show Dahlias; Mr. GEO. HUMPHRIES, Chippenham, was 2nd. With six fancy Dahlias the position of these exhibitors was reversed. Messrs. J. CRAY & SONS had the best six bunches of single Dahlias, and also nine bunches of Pompons. Messrs. JARMAN & Co. had the best six Cactus; all the Dahlias were better than could have been expected. *Phloxes* were shown in good character; there were *Asters* of the Comet type; *Phlox Drummondii* in bunches made a fine display. Mr. A. R. BROWN, Handsworth, was 1st with twelve self and twelve fancy Carnations, showing very good blooms. Mr. MARSHALL was 1st with twelve bunches of Stove and Greenhouse cut flowers. Fine *Begonia* blooms double and single from Mr. T. J. TARR, Yatton; and the Rev. J. D. PRING, North Cury.

HARDY PERENNIAL AND BULBOUS PLANTS

were finely shown in collections of eighteen bunches by Mr. W. TRESSEDER, Cardiff; and Messrs. W. J. STOKES & SON, Trowbridge. The best twelve bunches of Sweet Peas came from the Rev. P. W. BRAUCKER. The best twelve bunches competing for the special prize offered by Mr. R. SYDENHAM came from Mr. R. D. HANCOCK, Hale.

In the Amateurs' division cut flowers were numerous shown. The best eighteen bunches of perennials were from Mr. W. M. LAWES; Mr. J. POLE, Taunton, a close 2nd. *Gladioli* in collections of twelve spikes were good; *Asters* were not up to their usual mark. Mr. MARSHALL was 1st with twelve bunches of stove and greenhouse cut flowers; Dahlias, Roses, Dahlias of different types, and hardy annuals were also competing.

Floral decorations. The best dinner table, open to ladies only, was set up by Mrs. BARNET BLAKE, Bath; Mrs. HILL, Bridgwater, 2nd, both with charming arrangements. In another class Mr. T. LOCK, Crediton, was 1st; and Messrs. E. COLE & SON, 2nd, both displaying excellent workmanship. Messrs. J. CYPHER & SONS had the best *pergine*; Messrs. COUSINS, Taunton, the best hand bouquet. Baskets and bouquets of wild flowers were highly attractive.

FRUIT

was well represented. J. W. DIGNY, Esq., Sherborne Castle (gr., T. Turton), was 1st with eight dishes, having Black Hamburg and Muscat of Alexandria Grapes; Royal George Peaches, Elruge Nectarines, Figs, Melon Plums, and Apricots; the Exors. of Lady ASHBURTON, Romsey (gr., G. Hall), were 2nd. Mr. HALL had the same varieties of Grapes, also Peaches, Figs, Plums, &c. With four dishes Mr. HALL came 1st with finely finished Madresfield Court Grapes, Sea Eagle Peach, Pine-apple Nectarines and Melons; Mr. J. W. FLEMING, Romsey, (gr., W. Mitchell), was 2nd. Mr. MITCHELL had the best three bunches of Black Hamburg Grapes, well finished; Mrs. T. BOX, Yeovil, was 2nd.

With three bunches of any other Black Mr. MITCHELL came 1st with excellent Gros Maroc; Mr. HALL, 2nd, with Madresfield Court.

Mr. MITCHELL was 1st with three bunches of White Muscats; and Mr. TURTON, 2nd. Any other White was Foster's Seedling, from Mr. HALL; Mr. R. G. SCHMERVILLE, Taunton, was 2nd with very good Buckland Sweetwater.

Melons were plentiful; Peaches and Nectarines not so good as usual. Dessert Pears were represented by Jargonelle; dessert Apples by Beauty of Bath. Culinary Apples by fine Lord Sunfield. Red and White Currants were good; and Gooseberries very fine.

VEGETABLES

were well represented. Messrs. SUTTON & SONS, JARMAN & Co. and DANIELS BROS. all offered special prizes, but the general quality throughout was not equal to that in former years.

MISCELLANEOUS COLLECTIONS

abounded. Messrs. KELWAY & SON, Langport, had a very fine collection of *Gladioli*; and Certificates of Merit were awarded to Mrs. Badcock, Beatrice Kelway, C. M. Kelway, Countess of Dudley, and Happy Match. Messrs. R. T. VEITCH & SONS, Exeter, had a large and interesting collection of plants and flowers. Certificates of Merit were awarded to *Lonicera Hildebrandtii* and to a golden-leaved *Fagus* named *Zlatia*. They also had *Corydalis thalictrifolia* in good character. Mr. W. B. SMALE, Torquay, had Cactus and other Dahlias; a new variety of the former named Noonday appeared to be a refined *gloriosa*. Mr. VINCENT SLADE, florist, Taunton, had excellent zonal *Pelargoniums*, and also Clematis and Roses in pots. Messrs. M. PRICHARD, nurseryman, Christchurch, and Mr. J. H. WHITE, nurseryman, Worcester, had excellent collections of hardy flowers. Messrs. BLACKMORE & SONS, Twerton Nursery, Bath, and B. R. DAVIS & SON, Yeovil, *Begonias* in fine variety. Messrs. W. TUPLIN & SON had various flowers. Mr. W. TRESSEDER the same. Messrs. JARMAN & Co., Chard, a representative collection of cut flowers in good character, &c.

SHROPSHIRE HORTICULTURAL EXHIBITION AT SHREWSBURY.

"BIGGER AND BETTER THAN EVER."

AUGUST 19, 20.—On Wednesday and Thursday of the present week the twenty-ninth annual exhibition of the Shropshire Horticultural Society was held in the beautiful pleasure-grounds at Shrewsbury known as "The Quarry." The first exhibition was held in 1875, when the number of exhibitors was 74, the number of entries 217, the number of prizes 312, and the amount of prize-money £200. The extraordinary growth that has taken place is shown by the figures of 1902, when there were 379 exhibitors, 2,600 entries, 815 prizes, and £1,061 15s. in prize-money. The total receipts at the last exhibition amounted to £4,746, and the number of visitors was 75,000. During the Society's history it has contributed to local charities a sum of £6,428.

The Society has been so fortunate for years past in having good weather for its shows that the Committee now manages to keep cheerful until the exhibition day under conditions that would be quite sufficient to scare more timorous folk. On Tuesday last the appearances seemed altogether against fair weather. Rain fell in quantities, and the "glass" was very low. But as last year, on Wednesday morning the sun shone brightly, the "glass" was rising slowly, and throughout the day there was ideal weather. There can be no doubt that upon the whole the exhibition was larger and better than ever. We were informed that the secretaries received about 300 entries in excess of those of last year, and there were nine tents this year, and six or at most seven tents last year. The entries were therefore something like 3,000. As last year, the two largest tents were illuminated with electricity on the night preceding the show, so that exhibitors of groups for effect, and other arrangements that necessitate a great deal of time, were able to work during the greater part of the night.

The INDOOR FRUIT was as good as usual. In the Champion Grape class Mr. J. W. GOODACRE has won further laurels, beating Mr. SHINGLER, who won last year; and Messrs. BUCHANAN, who were 2nd last year and this. Messrs. BUCHANAN showed wonderful Muscat Grapes, three of their bunches taking the maximum number of points that could be awarded. It is worth special mention that Mr. GOODACRE won all the three 1st prizes in the big fruit classes, that for the dessert table and those for the Champion Grapes, and for a collection of sixteen dishes of fruit.

VEGETABLES were good. This wretched season has at least one redeeming feature. It has grown some good vegetables, excluding Potatoes, for these are diseased badly. The show at Shrewsbury promises well for that to be held next month at Chiswick.

For the rest, there were delightful exhibits of hardy flowers, Dahlias, tuberous Begonias, and many other plants and cut flowers.

The show gained very considerably by the exhibit of Hippeastrums from Col. HELFORD, and the splendid fruit trees from Messrs. RIVERS.

Once again it is our privilege to congratulate the Honorary Secretaries, Messrs. Adnitt and Naunton, upon the success attained, and which their efforts have so well deserved.

PLANTS.

The principal classes for plants are the ordinary ones for groups of miscellaneous plants arranged for effect. Never are there seen better, more skilfully arranged groups of this nature than those staged each year at Shrewsbury, and they are displayed in a spacious tent in which there is ample room for visitors to see them with comparative ease. We have on many previous occasions described the characteristics of these miscellaneous groups arranged for exhibition which have been for some years past of a style which Messrs. Cypher have done more than anyone else to make popular. The exhibits on this occasion were not so distinct from previous ones that it is necessary to describe them in detail. They are wonderful creations; they possess an extraordinary fascination for the bulk of the visitors, and they contain such an amount of material, and require such an expenditure of time, that they only become possible if large money-

prizes are offered to those exhibiting them. On the present occasion in the class for a group of plants in and out of bloom on a space of 300 square feet the 1st prize was awarded to Mr. W. FINCH, Coventry; the 2nd to Messrs. CYPHER & SON, Cheltenham; and the 3rd to Mr. W. VAUSE, Leamington. In a similar class for foliage plants exclusively the 1st prize was awarded to Messrs. CYPHER & SON; the 2nd to Mr. JOHN THOMPSON, Derby; and the 3rd to the Earl of CARNARVON, Bretby Park, Burton (gr., Mr. J. Read). In these two classes alone prizes are awarded which amount to £120.

Fifteen Stove and Greenhouse Plants.—Messrs. CYPHER & SONS, Cheltenham, easily won in this class, and showed mammoth plants of *Statice intermedia*, *Stephanotis floribunda*, *Erica Marnockiana*, *Allsmanda nobilis*, *Codiaeum Warreni*, *Ixora Duffii*, *Bougainvillea Cypheri*, &c.; 2nd, Mr. W. VAUSE, Leamington; 3rd, Mr. W. FINCH, Coventry.

Six Stove and Greenhouse Plants.—The best collection of six plants was shown by T. SUTTON TIMMIS, Esq., Cleverley, Allerton, Liverpool (gr., Mr. B. Cromwell). The species were *Lapageria rosea*, *Stephanotis floribunda*, *Ixora Williamsii*, *I. Duffii*, *Statice profusa*, and *Kentia Fosteriana*. The 2nd prize fell to Messrs. CYPHER & SONS.

Begonias.—There were excellent displays of tuberous-rooted *Begonias* in pots, on spaces of 15 feet by 4 feet. The 1st prize was won by a truly magnificent exhibit from Mr. FRED DAVIS, Woolshill (gr., Mr. Pershore). The flowers were as large as the best shown at the "Temple" exhibition in May. 2nd, Messrs. BLACKMORE & LANGDON, Twerton Hill Nurseries, Bath; 3rd, Messrs. B. R. DAVIS & SON, Yeovil.

Caladiums were shown by a few exhibitors, and the best were good-sized specimens from T. SUTTON TIMMIS, Esq., Cleverley, Allerton (gr., Mr. Cromwell).

Coleus plants were shown, trained as pyramids about 5 to 6 feet high. Some of the best were shown by JNO. BARKER, Esq., Old Grammar School House, Shrewsbury (gr., Mr. H. Worrall).

Zonal Pelargoniums and *Fuchsias* were exhibited in specimens of moderate size.

Ferns were quite a feature in one of the tents. There were several collections of four exotic species, the 1st prize being awarded to T. SUTTON TIMMIS, Esq.

The best collection of *Thirty miscellaneous plants* was shown by Lord HARLECH, Brogyntyn (gr., Mr. T. Lambert). The plants were in five-inch pots, and some of them suitable for the ornamentation of the dinner table.

The best collection of twelve plants suitable for the dinner table, was from T. SUTTON TIMMIS, Esq., Allerton, being very pretty specimens of *Codiaeum*, *Palms*, and *Pandanus Veitchii*.

Lord HARLECH obtained a 1st prize for a collection of six stove and greenhouse plants, in a class limited to residents in Shropshire. In this exhibit was a very good plant of *Clerodendron fallax*, evidently a "cut back" specimen. There were other classes likewise limited to Shropshire residents, to which we cannot refer in detail.

Gloxinias were good, but not specially remarkable (except those from Messrs. SUTTON & SONS).

Cordylines (*Dracenas*) were shown also in classes by themselves, and there were some good plants amongst these.

THE DESSERT TABLES.

The first class in this section is that for a dessert table, decorated with plants and foliage, the tables measuring 10 feet by 4 feet 6 inches. Not more than fifteen dishes of fruit were permitted in each exhibit, and the kinds that might be selected were specified in the schedule. Each table was covered with a white cloth, but no silver, electro-plate, wine-glasses, or decanters were allowed. There were three exhibitors, and of these the Earl of HARRINGTON, Elvaston Castle, Derby (gr., Mr. J. H. Goodacre), was successful in winning the 1st prize, having an exceedingly attractive arrangement. The fruits shown and the number of points awarded each were as follows:—

	Points awarded.	Points possible.
Apples	6½	7
"	6½	7
Figs	5	7
Grapes	6½	10
"	8	10
"	5	10
"	7½	10
Melons	7	8
"	6	8
Nectarines	7½	8
"	6	8
Peaches	6½	8
"	5½	8
Pears	6½	7
"	6½	7
For Decoration ...	24	28
Points awarded ...	118½	151

The varieties of fruits shown were as follows:—Grapes, Muscat of Alexandria, Canon Hall Muscat, Madresfield Court, and Black Hambro; Apples, Ribston Pippin, Washington; Nectarines, Elruge,

Pineapple; Peaches, Bellegarde and Princess of Wales; Pears, Pitmasston Duchess and Marguerite Marillat; Figs, Brown Turkey; and two Melons. The decorations were of Francos, Gypsophils, and Chironia. The 2nd prize was won by G. FARQUHAR, Esq., Eastnor Castle (gr. Mr. G. Mullins), who won a total of 107 points. He had excellent Bigarreau Napoleon Cherries, fine and richly coloured Bellegarde Peaches, two good Melons, a satisfactory dish of Figs and Apricots, Nectarines, Apples, four bunches of Grapes, &c. The decorations were of Francos and *Montbretia crocosmiflora*. 3rd, The Hon. Mrs MEYNELL INGRAM, Temple Newsam, Leeds (gr. Mr. R. Dawes), who was awarded 97 points.

COLLECTIONS OF FRUIT.

There were three important classes for collections of fruits, and in each case the exhibits were decorated with plants and flowers, that were judged separately, and awarded three additional prizes in each class.

COLLECTION OF SIXTEEN DISHES.

The largest class called for sixteen dishes of fruit, distinct, in not fewer than twelve kinds, and including not more than two varieties of a kind. Black and white Grapes were to be considered distinct kinds of fruit. The exhibits occupied spaces of 8 feet by 4 feet 6 inches each. Pines were excluded, and the prizes were designed to encourage the "highest cultural merit." There were three exhibits, and the 1st prize was won by the Earl of HARRINGTON (gr., Mr. J. H. Goodacre). He had of Grapes, Duke of Buccleuch (2), Madresfield Court, very nice (2), Black Hambro (2), and Muscat of Alexandria. The Muscats were well coloured, but not of remarkable weight. Of Peaches there were Bellegarde and Princess; Nectarines, Lord Napier; Figs, Brown Turkey; Apricots, Turkey; Plums, Transparent Gage; Strawberry Royal Sovereign; Pears, Souvenir du Congrès; Apple Ribston Pippin; Melons, Taunton Here and a seedling; and Cherries, Morello. The veteran victors in so many battles showed capitally in this one. The 2nd prize was won by Lord BIDDLEPH, Ledbury Park (gr., Mr. J. Dawes). He had good Black Alicante Grapes, very heavy, and moderate bunches of Muscat of Alexandria and Cooper's Black; also immensely large Sea Eagle Peaches, very fine Morello Cherries, Lord Napier Nectarine, Transparent Gage Plums, Brown Turkey Figs, &c. 3rd, Mr. F. Jordan, gr. to Dr. CORBETT, Impney Hall, Droitwich. This exhibitor had large, very well-coloured bunches of Chasselas Napoleon Grapes, and several other varieties of Grapes in good condition, especially Muscat of Alexandria; he had excellent Peaches Bellegarde and Violet Hative, Nectarines Spenser, Apricot Moorpark, Melons Hero of Leckinge and Frogmore Scarlet, &c. This exhibitor won the 1st prize for his decorations, and the Earl of HARRINGTON was 2nd.

Collection of twelve Dishes.—In this class there was a very fine display, there being five exhibitors. The 1st prize was won by the Hon. Mrs. MEYNELL INGRAM, Temple Newsam, who showed Gros Maroc, Muscat of Alexandria, and Madresfield Court Grapes, of which the Muscats were weakest; Peaches Bellegarde and Dymond, Nectarine Stanwick Elruge (very highly coloured), Plum Kirke's, Fig Brown Turkey, Apple Washington, Pear Marguerite Marillat, Melons Ring-leader and another; Mrs. F. NEED, York House, Malvern, won the 2nd prize. Peaches were again very good in this exhibit, Apples and Plums very weak, and the rest of moderate quality. 3rd, H. H. FRANCE HAYHURST, Esq., Overley, Wellington (gr., Mr. S. Bremmell); and 4th, Mrs. SWANN, Halston Hall, Oswestry (gr., Mr. C. Roberts). For decoration, the 1st prize was awarded to the exhibitor last named.

Collection of Nine Dishes.—There were only two exhibitors in this smaller class, and the 1st prize was won by C. F. K. MAINWARING, Esq., Oteley, Ellesmere (gr., Mr. C. Wilkins). He had two dishes of Peaches and two dishes of Nectarines, four bunches of Grapes, a Melon, a dish of Figs, and a dish of Pears. 2nd, Rev. T. M. BULKELEY, Owen Tedsmore Hall, West Felton (gr., Mr. J. Langley), who had rather heavy bunches of Foster's Seedling Grapes, though not perfectly finished, and a good dish of Prince Englebert Plums, &c.

CHAMPION GRAPE CLASS.

(FIRST, MR. GOODACRE.)

In class seventy-seven there was a great contest for the magnificent Silver Vase, value £52 10s., which was illustrated in these pages in August last year, and which the Marquis of HASTINGS (gr. Mr. W. Shingler) has held during the past twelve months. This Challenge Vase will not become the property of an exhibitor until he has won it three times.

The class calls for twelve bunches of grapes, in four or more distinct varieties, but not more than four bunches of any one variety. The directions to the judges were that each bunch should be judged on its individual merits, and points awarded accordingly. The maximum number of points that could be awarded for Muscat varieties was eleven, for Black Hamburgs ten, and for each other variety, nine. Superior cultivation and finish were to be given preference over mere size. Each collection was decorated with

flowering or foliage plants, and cut flowers, but this was done to secure a good effect only, the decorations being judged and an additional prize awarded, quite independently of the fruit. There were five exhibits, and therefore sixty good bunches of grapes.

The 1st prize was narrowly won by the Earl of HARRINGTON (gr., Mr. Goodacre), who succeeded owing to the varieties selected being finer in quality than those in the second prize collection, and consequently the pointing was higher. But in the 2nd prize collection some of the bunches were awarded the maximum number of points possible to the varieties shown. The Earl of HARRINGTON'S collection included Muscat of Hamburg (3), Muscat of Alexandria (4), Madresfield Court (3), Black Hamburg (2). The pointing was as follows:—

Bunch No.	Variety	Points possible.	Points awarded.
1...	Black Hamburg	10	9
2...	Madresfield Court	11	10
3...	Muscat of Alexandria	11	9
4...	Madresfield Court	11	10
5...	Muscat of Alexandria	11	8
6...	Muscat Hamburg	11	10½
7...	Muscat Hamburg	11	11
8...	Muscat of Alexandria	11	9
9...	Madresfield Court	11	10½
10...	Black Hamburg	10	9½
11...	Muscat of Alexandria	11	8½
12...	Muscat Hamburg	11	10½
		130	115½

The above collection was praiseworthy from every point of view, and most of the bunches were of good weight and finish.

The 2nd prize was awarded to Messrs. D. & W. BUCHANAN, Kippen, Stirling, N.B., who won 113½ points. The four bunches of Muscat of Alexandria in this exhibit were the best in the show, being about 5 lb. each in weight, and highly finished. The fourth bunch was a little less heavy, but it was better coloured than any. The pointing was as follows:—

Bunch No.	Variety	Points possible.	Points awarded.
1...	Alnwick Seedling	9	8½
2...	Muscat of Alexandria	11	11
3...	Cooper's Black	9	9
4...	" " "	9	8½
5...	Muscat of Alexandria	11	11
6...	Cooper's Black	9	9
7...	Black Alicante	9	9
8...	Muscat of Alexandria	11	11
9...	Alnwick Seedling	9	9
10...	" " "	9	8½
11...	Muscat of Alexandria	11	10½
12...	Black Alicante	9	8½
Total		116	113½

The Black Alicante bunches were very heavy. This firm was 2nd last year also. The 3rd prize was won by Lord HASTINGS, Melton Constable Hall, Norfolk (gr. Mr. W. Shingler), who won the Champion Vase last year. This year he gained 107½ points. His varieties were Madresfield Court (4), Muscat of Alexandria (2), Black Hamburg (1), Alnwick Seedling (4), Gros Maroc (1). He obtained maximum points for single bunches of Madresfield Court, Alnwick Seedling, and Gros Maroc. The Muscats of Alexandria were weak, one bunch particularly lacking colour. 4th, Col. PLATT, C.B., Gording (gr., Mr. W. A. Coates), who got 105½ points. 5th, the Hon. Mrs. MEYNELL INGRAM, Temple Newsam, near Leeds (gr., Mr. R. Dawes), who was awarded 80 points.

The prizes for decorations were awarded in this Class as follows:—1st, Col. PLATT; 2nd, Hon. Mrs. MEYNELL INGRAM; 3rd, The Earl of HARRINGTON.

OTHER GRAPE CLASSES.

There were six exhibitors in a class for four bunches of Grapes, two of a black and two of a white variety. The best bunches were from Lord HARLECH, Brognyntyn, Oswestry (gr. Mr. T. Lambert). The varieties were: Muscat of Alexandria, long well-shaped bunches about 3 lb. in weight, pretty well finished, and Madresfield Court, of good weight and moderate finish. 2nd, J. BAYLEY, Esq., Bryn-y-Mewadd, Llanfairfechan (gr. Mr. C. Richardson). In this case the varieties were Muscat of Alexandria and Black Hamburg, all heavy bunches of pretty good finish. 3rd, F. K. MAINWARING, Esq., Oteley, Ellesmere.

Two Bunches Black Hamburg.—Two very excellent bunches won 1st prize for the Earl of HARRINGTON (gr., Mr. Goodacre). The colour of the berries was splendidly developed in this case. Larger bunches and less good berries were shown by the Rev. T. M. BULKELEY OWEN, 3rd, E. MULLER MUNDY, Esq., Shipley Hall, Derby (gr. Mr. J. C. Tallack). There were five exhibitors.

Single Bunch of Black Hamburg.—The Earl of HARRINGTON (gr., Mr. Goodacre) was again 1st for the single bunch, showing a short thick heavy bunch, large in berry and well coloured. There were eight exhibitors.

Two Bunches of Madresfield Court.—This variety was shown best by Lord HASTINGS (gr. Mr. Shingler), who had very long slightly curved bunches of very large

berries, that were thoroughly "finished," and densely covered with bloom. The Earl of HARRINGTON came next with good bunches, bearing less colour; and the Rev. T. M. BULKELEY OWEN was 3rd. All of these were good. There were seven exhibitors.

Two Bunches Black Alicante.—There were four exhibits in this class, and Lord HASTINGS won the 1st prize with very heavy, perfectly coloured examples; 2nd, J. C. WATERHOUSE, Esq., Prestbury (gr., Mr. A. H. Hall).

Two Bunches of Gros Maroc.—Of eight exhibits in this class, that from Lord HASTINGS (gr., Mr. Shingler) was ahead of the others, the bunches were large, and the berries were as big as Plums; 2nd, the Earl of HARRINGTON; and 3rd, Mrs. F. ALDERSON, Frankton (gr., Mr. G. Davies).

Two Bunches of Muscat of Alexandria.—There were eight exhibits in this class for the best of all Grapes, and the 1st prize was awarded to Mrs. H. S. GOUGH, Taly-Cafn, R.S.O. (gr., Mr. F. W. Everett), who had immense bunches, probably 7 lb. each in weight; but they were not very well coloured, and some of the berries were rather small; 2nd, J. BAYLEY, Esq., Llanfairfechan (gr., Mr. C. Richardson), with good bunches a little weak in colour; 3rd, Earl of HARRINGTON, with long, rather meagre bunches, of excellent colour.

Single Bunch Muscat of Alexandria.—The 1st prize was won from eight other exhibitors by Messrs. D. & W. BUCHANAN, Kippen, N.B.

Any other White Grape.—There were five entries, and the 1st prize was won by J. C. WATERHOUSE, Esq., Prestbury, for small bunches of Chasselas Napoleon, with extra large berries of good colour; 2nd, Col. PLATT, C.B., with very heavy bunches of Foster's Seedling, small in berry, and not fully coloured; 3rd, D. MARRIAGE, Esq., Chorley, Lancs. (gr., Mr. F. W. Kerr), with rather poor bunches of the same variety.

Single Bunch of Diamond Jubilee.—The 1st prize was awarded to a densely coloured bunch of big berries shown by T. CORBETT, Esq., Impney Hall, Droitwich (gr., Mr. F. Jordan). The Earl of HARRINGTON (gr., Mr. Goodacre) had an excellent bunch of this much discussed Grape, not coloured so well, but the berries were extremely large.

STONE AND OTHER FRUITS.

Six Plums.—There were eight entries, and a dish of the variety Prince Englebert, shown by J. B. WOOD, Esq., Henley Hall, Ludlow (gr., Mr. H. Huxter), was placed 1st.

Twelve Red Plums.—The Earl of HARRINGTON (gr., Mr. Goodacre) won 1st prize in this class with fine fruits of Cox's Emperor.

Twelve Purple Plums.—The variety Kirk's Plum, won in a competition amongst eight exhibitors, the winner being the Earl of HARRINGTON.

Twelve Yellow Plums.—Golden Drop won 1st prize here for the Earl of HARRINGTON; and in a class for twelve Gage Plums, the 1st prize was awarded to the same exhibitor for a good dish of Transparent Gage.

Melons.—The best white-fleshed Melon was Hero of Locking, shown by R. CLAYTON SWAN, Esq., Gaddesby Hall, Leicester (gr., Mr. G. Selley); there were eleven exhibits. Of the scarlet-fleshed varieties, the best was Sutton's Scarlet, shown by Mrs. R. DARBY, Adcote (gr., Mr. R. Lawley); there were fourteen exhibits. The best green-fleshed variety was a seedling, shown by the Earl of HARRINGTON.

Apricots.—There were seven dishes of Apricots, and some of the fruits were very fine. The 1st prize was won by Major CLIVE, Hereford (gr., Mr. R. Grindrod), with beautiful fruits of Early Red.

Nectarines.—There were eight dishes of Nectarines, and all of them were satisfactory. The best was Rivers' Orange, shown by Sir GEO. MEYRICK, Bodorgan, Anglesey (gr., Mr. W. Pilgrim); 2nd, the variety Pineapple, shown by R. CLAYTON SWAN, Esq.

Twelve Peaches.—Among twelve dishes of twelve Peaches, the best was Bellegarde, shown by Major CLIVE; and the same variety shown by the Hon. Mrs. MEYNELL INGRAM was 2nd; and the variety Violet Hative, from T. CORBETT, Esq., Impney Hall, Droitwich, was 3rd. The Peaches were capital throughout in size and colour.

CUT FLOWERS.

The principal cut flower at Shrewsbury this year was the Sweet Pea. There were numerous classes in which prizes were offered by Mr. ROBERT SYDENHAM and other trade growers, as well as those by the Society itself. One tent contained Sweet Peas exclusively, and they were staged in other tents as well. Some of the exhibits were exceedingly pretty, but we cannot refer to them now in detail. The following exhibitors were amongst those who won 1st prizes:—Mrs. C. LASHMORE, Market Drayton; Miss M. E. JONES, Grapes Hotel, Bictan; Mr. W. SHROPSHIRE, Market Drayton; Mr. T. JONES, Ruabon; Mr. H. ALDERSEY, Aldersey Hall, Chester (gr., Mr. Jno. Chisholm).

HARDY FLOWERS.

There were several very fine displays of hardy perennial flowers, and together they constituted a bank of bold flowers that compared favourably with

those at any previous show at Shrewsbury. The 1st prize for a collection in which a frontage of 15 feet was allowed each exhibit, was won narrowly by Messrs. HARKNESS & SONS, Bedale, Yorks. In this group *Lilium auratum* and varieties of *L. speciosum* were grand, and a bold bunch of flowers of the scarlet variety of *Gladiolus*, Miss Beecher, was dazzling and extremely good. Many of the finest species of hardy flowers were represented, but it is impossible to refer to all of them. Mr. M. PRITCHARD, Christchurch Nurseries, Hants, was 2nd, and included a capital bunch of *Crinum Powelli*; 3rd, Messrs. G. GIBSON & Co., Leeming Bar, Bedale.

An excellent collection of twenty-four bunches of hardy flowers was shown by Miss HUMBERSTON, Newton Hall, Chester (gr., Mr. R. Wakefield), who won the 1st prize for twelve bunches. The 2nd prize in the larger class was won by Messrs. G. GIBSON & Co., Bedale, Yorks.

DAHLIAS.

There were Dahlias in abundance. The Cactus varieties showing to splendid advantage in a class for Cactus or Decorative varieties, in collections having frontages of 10 feet 6 inches. In the 1st prize exhibit from Messrs. W. B. ROWE & SON, Worcester, a few *Adiantum Ferns*, and much *Gypsophila* were used to relieve the flowers, but in the 2nd prize collection from Mr. S. MORTIMER, Rowledge Nurseries, Farnham, Surrey, a different method of arrangement was adopted, and in place of the Ferns and *Gypsophila* a little *Dahlia* foliage was used with less confusing effect. In each case the flowers were good. Messrs. KEYNES, WILLIAMS & Co., Salisbury, were 3rd.

The following class was of similar importance to the last one, the spaces and prizes being the same, but any varieties of Dahlias were permissible. In this case the 1st prize was won by a Cardiff exhibitor, Mr. WM. TRESEDER, of that town, who showed exceedingly well, having the show, decorative, Cactus, and single varieties effectively displayed in Bamboo pillars and in other receptacles that afforded variety and effect. The flowers were very good also. 2nd, Messrs. KEYNES, WILLIAMS & Co. 3rd, Messrs. JONES & SON, Shrewsbury.

CARNATIONS.

The best display of cut Carnations was made by Mr. A. F. DUTTON, Bexley Heath, Kent, who had not only excellent flowers, but staged them to the best effect possible. 2nd, Messrs. M. CAMPBELL & SON, High Blantyre, N.B. 3rd, W. A. WATTS, Esq., Bronwylla, St. Asaph.

There were very beautiful florists' exhibits. Messrs. JENKINSON & SON, Newcastle-under-Lyme, won 1st prize for brides' and bridesmaids' bouquets; Messrs. PERKINS & SON, Coventry, were 2nd in these classes, but 1st for a featherweight bouquet.

VEGETABLES.

So considerable is the Vegetable department, that it makes an exhibition of itself. There are no fewer than nine collection classes, and some thirty lesser ones, all producing strong competition. The average quality was very good, but some things stood out with remarkable excellence.

Messrs. Sutton & Sons' Prizes.—These were six, ranging from £1 to £1, the 1st being taken by that strong exhibitor Mr. J. Gibson, gr. to R. W. HUNSON, Esq., Great Marlow. He had, quite superb throughout, Ailsa Craig Onions, Best-of-All Runner Beans, Perfection Tomatoes, Prizetaker Leeks, Solid White Celery, Mammoth Cauliflowers, Windsor Castle Potatoes, Gladstone Peas, and Red Intermediate Carrots. Mr. E. BECKETT, gr. to Lord ALDENHAM, Elstree, was 2nd, having very fine Celery, Runner Beans, Peas, Onions, Tomatoes, all of similar varieties. Mr. ASHTON (gr. to the Earl of LATHOM, Ormskirk) was 3rd; and Mr. C. WILKINS (gr. to C. F. K. MAINWARING, Esq., Ellesmere), 4th.

In Messrs. Jas. Carter & Co's Class, also for nine dishes, Mr. BECKETT was a good 1st, having Madel Telephone Peas, Duke of York Tomatoes, Windsor Castle Potatoes, Holborn Madel Leeks, Elephant Runner Beans, Perfection Carrots, Solid Ivory Celery, and Giant Cauliflowers. Second came Mr. D. GIBSON (gr. to Mrs. JOHNSTONE, Kingston-on-Thames), with excellent exhibits. Mr. ASHTON was 3rd; and Mr. READ (gr. to the Earl of CARNARON, Breby Park), was 4th.

Messrs. R. Smith & Sons, Worcester, had a class also for nine dishes. Mr. M. A. HORNSFOOT, Ruabon, came 1st with very superior products; Leeks, Cauliflowers, Celery, Snowball Turnips, Potatoes, Gladstone Peas, &c., were very good indeed. Mr. BECKETT was second with good exhibits; Mr. BREMELL, gr. to H. H. FRANCE HAYHURST, Esq., was 3rd, and Mr. G. DAWES, Pool Parva, 4th.

Messrs. Webb & Sons' prizes for eight dishes were six in number, and like Messrs. J. CARTER & Co's, commenced with £1. In this case Mr. ASHTON was 1st having fine Cauliflowers, good Onions, Runner Beans, Renown Potatoes, Kaiser Peas, Tomatoes, Celery, and Leeks; Mr. J. BASTIN, gr. to Sir A. HENDERSON, M.P., Buscot Park, Berks, came 2nd with excellent products; Mr. H. FOLKES, gr. to the Right Hon. J. J. HALSBY, Esq., M.P., Hempstead, Herts, coming 3rd, and Mr. C. JONES, gr. to the Misses HOWELL, Berriew, 4th.

The Society's class for twelve dishes again brought Messrs. J. GIBSON and E. BECKETT into competition, in this case twelve dishes being required. The first named was placed 1st, and the latter 2nd, the exhibits comprising kinds already generally mentioned.

Mr. E. Murrell had a class for eight dishes, in which Mr. M. C. Townsend, gr. to J. B. ACKROYD, Esq., Chalfont Park, Slough, was 1st, staging good things; Mr. J. Birch, gr. to Captain BUTLER, Shelton Hall, was 2nd. In a class for six dishes by the same donor, Mr. J. Clowes, gr. to G. F. WARD, Esq., Hadnall Hall, was 1st; Mr. G. Abbott, gr. to Mrs. C. GUISE, Hadnall, coming 2nd.

Mr. R. Sydenham, as usual, offered sixty small money prizes in ten classes, the first being as under:—Two dishes of Peas, with Duke of Albany and The Gladstones, capital pods, Mr. HORSPOOL was 1st. With a dish of very fine Runner Beans, Mr. LEITH, gr. to Col. MIDDLETON ROSS, was 1st. Three Cauliflowers, Mr. J. READ. Six Carrots, Mr. A. FOLKES, handsome New Intermediate. Six Parsnips, Mr. LEITH, with very fine White Hollow Crown. Eight Onions, Mr. LEITH, with good Ailsa Craig. Dish of Tomatos, Mr. F. Clarke, gr. to M. FIRTH, Esq., Leicester. Six Turnips, Mr. HORSPOOL, small but very perfect Snowball. Three Celery, Mr. FOLKES, with good Standard Bearer. Two dishes of Potatos, Mr. E. Walker, gr. to Sir W. HONEYMAN, Bt., Whitechurch, the varieties being Duke of York and Snowdrop—very handsome samples.

Messrs. Hewitt & Sons had a class for six dishes, Mr. READ being 1st, and Mr. WALKER, 2nd. There was great competition in the single dish, or other small classes, for prizes offered by the Society. Mr. H. Powell, gr. to C. T. HATHERLEY, Esq., Addlestone, Surrey, having the best Scarlet Runners; Mr. LEITH the most perfect dwarfs in Canadian Wonder; Mr. HORSPOOL the best Peas, with The Gladstone; Mr. A. Hall, gr. to J. C. WATERHOUSE, Esq., Prestbury, had handsome unnamed Cucumbers. Mr. J. JONES (gr. to Mrs. F. Need), the best Tomatos, and Mr. ASHTON was first in a single dish of Potatos with Ideal, and the same with two dishes having very handsome Sir J. Llewellyn and Duke of York. In the Cottagers' Classes there was a remarkable competition, quality, as usual, ruling high. Some £150 are offered in prizes for vegetables at this great exhibition.

The result of the adding up of points gained by exhibitors in Mr. Sydenham's classes was that Mr. LEITH again wins the Silver Challenge Bowl, and it now becomes his property finally, this being the third win.

HONORARY EXHIBITS

have usually been numerous at Shrewsbury, but they seem to increase even now. A group of Hippeastrums in bloom in pots, shown by Captain HOLFORD, Westonbirt, Tetbury (gr., Mr. Chapman), was one of the most noteworthy when we remember the time of the year. It is said that the bulbs had been retarded as well as they could be in sheds, &c., with a north aspect. In any case, they were magnificent, and showed perfect cultivation, nor was the quality of the varieties less noteworthy.

Mr. JNO. FORBES, Hawick, N.B., had a very pretty exhibit of Pentstemons, herbaceous Phlox, double-flowered Stocks, single blooms of Carnations. All of these flowers being specialties of Mr. FORBES were of fine quality, the long spikes of large, brightly-coloured flowers of Pentstemons showing to capital effect.

Messrs. WM. BULL & SONS, New Plant Nurseries, King's Road, Chelsea, London, exhibited choice foliage plants and several good Nepenthes (N. Chelsoni, N. x mixta, and N. Mastersiana), carrying a good number of pitchers. The foliage plants included Cordylines, Ferns, Codiaums, &c.

Roses were well shown by Mr. EDWIN MURRELL, Portland Nurseries, Shrewsbury. He had a very large exhibit of good blooms of a large number of popular varieties, among which a box of blooms of Mrs. John Laing was conspicuous.

Messrs. JAS. BACKHOUSE & SON, York, had a group of herbaceous perennial flowering plants in pots, and a pretty little rocky planted with Alpines.

Mr. W. B. CHILD, Edelweiss Nurseries, Acock's Green, Worcestershire, had a very large group of hardy flowers.

A very large exhibit of hardy flowers was shown by F. BONSKELL, Market Bosworth, which would seem to be sufficient to deplete any amateur's garden.

Messrs. DOBBIE & CO., Rothesay, N.B., staged a magnificent collection of Dahlia flowers in which the sections, exclusive of the show section, were well represented by good flowers. The firm had also about two dozen varieties of Potatos in baskets.

Messrs. W. CUTBUSH & SON, Highgate Nurseries, London, N., exhibited a group of hardy flowers, including Nymphæas and a few alpine plants, &c.

THE RANELAGH NURSERY CO., Royal Leamington Spa, had a large group of Asparagus myriocladus.

From Miss TALBOT, Margam Park, Port Talbot (gr., Mr. Milner), were shown fruits of nearly a dozen varieties of Oranges.

Messrs. LAING & MATHER, Kelso, N.B., exhibited cut flowers of varieties of Carnations.

Mr. J. H. WHITE, Worcester, had a large group of hardy flowers in great variety.

Mr. H. DEVERILL, Banbury, showed a group of hardy

flowers; and Mr. H. DEVERILL, Banbury, a collection of cut Roses and Zonal Pelargoniums.

Messrs. GUNN & SONS, Brookfield Nursery, Olton, Birmingham, had a collection of varieties of herbaceous Phlox.

Messrs. PRITCHARD & SONS, Shrewsbury, showed a nice group of Ferns in pots, also Codiaums.

Messrs. T. RIVERS & SON, Sawbridgeworth, Herts, started the Shropshire folk with one of their fine displays of orchard-house fruit-trees in pots. There were Vines, Apples, Plums, Peaches, Nectarines, Cherries, and several varieties of each. Some of the Peach-trees were 7 feet high, and laden with fruit. There were about fifty specimens. Upward of a dozen fruits of the new Peach Peregrine were shown. This is described as a very valuable variety which the firm will distribute next year.

A very showy display of Zonal Pelargoniums was made by Mr. ALBERT MYERS, Sutton Lane Nurseries, Shrewsbury. Well cultivated plants and huge trusses of bloom of a large number of varieties were shown.

Messrs. DICKSONS, LTD., Chester, showed some nice hardy flowers in clean-looking specimens, also some stove and greenhouse plants in pots.

Messrs. SUTTON & SONS, Reading, showed Gloxinias, and a most interesting collection of crested Begonias. The display of Gloxinias was very large, and of the usual good quality of the firm.

An interesting display of varieties of hardy Heaths was made by Mr. T. R. HAYES, Keswick, Cumberland, also a very fine lot of Scolopendrium crispum majus.

Messrs. B. R. DAVIS & SONS, Yeovil, showed a fine lot of tuberous rooted Begonias.

Messrs. J. PEED & SONS, Norwood, London, exhibited a fine group of Caladiums.

Mr. JOHN RUSSELL, Richmond Nurseries, Surrey, showed a group of stove and greenhouse plants, including some finely cultivated plants.

Messrs. RD. SMITH & CO., Worcester, exhibited a large group of hardy flowers in the ground in the big "group" tent. It was a very interesting collection.

Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, near Bath, showed a magnificent group of Begonias.

Messrs. W. CLIBRAN & SON, Altrincham and Manchester, made a display of herbaceous plants and cut sprays of choice shrubs.

Mr. HENRY ECKFORD, Wem, Shropshire, showed a glorious group of Sweet Pea flowers of their latest and best novelties, including the remarkable Scarlet Gem and others.

Mr. F. M. BRADLEY, Paterboro', showed a collection of Carnation blooms; Messrs. W. & J. BROWN, Peterboro', Carnation and Pelargonium blooms; Messrs. JARMAN & CO., Chard, had a large collection of Dahlias, and vegetable roots; Mr. VINCENT SLADE, Staplegrave Nurseries, Taunton, Somerset, flowers of Zonal Pelargoniums.

HOBBIES LIMITED, Dereham, Norfolk, exhibited an immense display of Roses, Dahlias, &c.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, had a very fine plant of the new Senecio chlorivum, from Central China, previously described and figured in these pages, and a good plant of Astilbe Davidii, also illustrated in the *Gardeners' Chronicle*.

Messrs. R. HARTLAND & SON, Cork, exhibited a quantity of Begonia blooms, Gladiolus, and Zonal Pelargonium blooms.

A display of "St. Brigid" Anemones, was made by Messrs. REAMSBOTTOM & CO., Geashill, King's County. It is very late for these flowers.

Mr. AMOS PERRY, Hardy Plant Farm, Winchmore Hill, London, N., exhibited about forty varieties of bog and water grasses and plants, and flowers of forty varieties of Nymphæa—a very interesting exhibit.

Messrs. JONES & SON, Shrewsbury, exhibited a collection of Sweet Peas.

Mr. ROBERT BOLTON, Warton, Cusworth, exhibited a large collection of Sweet Peas. Mr. W. L. PATTISON, Cherry Orchard, Shrewsbury, flowers of varieties of Viola. Mr. W. ANOUS, Penicuik Gardens, N.B., flowers of a variety of Chrysanthemum maximum named "King Edward"—the flowers were especially large and bold. Mr. JOHN DERBYSHIRE, Ashley Road, Hale, Altrincham, showed a nice lot of Sweet Peas.

Honorary Awards.

LARGE GOLD MEDALS.

Captain Holford, Westonbirt; Hobbies, Ltd., Dereham; Sutton & Sons, Reading; Dobbie & Co., Rothesay; T. Rivers & Sons, Sawbridgeworth.

SMALL GOLD MEDALS.

R. Smith & Co., Worcester; J. Peed & Sons, West Norwood, London, S.E.; Dicksons, Ltd., Chester; A. Perry, Winchmore Hill, London; Jarman & Co., Chard, Somerset; Jno. Russell, Richmond, London; W. B. Child, Acock's Green, Birmingham; Blackmore & Langdon, Twerton Hill, Bath; A. Myers, Sutton Lane Nurseries, Shrewsbury; Ranelagh Nursery Co., Leamington; Ed. Murrell, Shrewsbury.

SILVER-OILT MEDALS.

Hewitt & Co., Solihull, Birmingham; Henry Eckford, Wem; Robert Bolton, Carnforth; W. Cutbush &

Son, Highgate, London; W. Clibran & Son, Altrincham; Reamsbottom & Co., King's County, Ireland; B. R. Davis & Sons, Yeovil; John Forbes, Hawick, N.B.; H. Deverill, Banbury; F. Bonskell, Market Bosworth; Nuneaton; T. R. Hayes, Keswick, Cumberland; Jones & Sons, Shrewsbury; J. H. White, Worcester; Pritchard & Sons, Shrewsbury.

SILVER MEDALS.

W. Bull & Sons, Chelsea, London; W. & J. Brown, Peterborough; Vincent Slade, Taunton; Jas. Backhouse & Son, Ltd., York; R. Milnes, Port Talbot; Laing and Mather, Kelso; W. L. Pattison, Shrewsbury; Jno. Derbyshire, Hale; F. M. Bradley, Peterborough; R. Hartland & Son, Cork; Gunn & Sons, Olton.

BISHOP'S STORTFORD HORTICULTURAL.

AUGUST 12.—The thirty-fourth annual exhibition was held at The Grange, the residence of John Barker, Esq., and was a great success in every way. The large plant classes constituted the only weak feature of the show. Cut-flowers were very fine, and the competition good. Fruit was excellent, and vegetables also; indeed, by the exhibits staged, it would appear that there has been less injury to crops in this part of the country than in some others. The table decorations, for which a large tent was allotted, brought forth thirty-one lady exhibitors.

The groups of plants were, in some instances, very fair productions, and Mr. Harrison, gr. to Colonel ARCHER HOUBLON, Hallingbury Place, was 1st; Mr. W. Clark, gr. to Mr. G. GOLD, Stanstead, 2nd.

Stove and Greenhouse Plants in Flower did not make a strong class, though nice plants were staged. Mr. G. Beech, gr. to JOHN BARKER, Esq., being 1st; and Mr. Brown, gr. to W. HOLLAND, Esq., was 2nd. For twelve plants grown in 8 inch pots, Mr. BEECH was a good 1st, there being six in bloom, and the others were foliage plants. The same exhibitor was an easy 1st for Ferns, showing well-grown plants.

Begonias were scarcely so large or so good as in former years. Mrs. A. TAYLOR was 1st for an exhibit consisting of single flowered plants, and Mr. W. SMITH was 2nd, with very fine doubles, which unfortunately were not at their best. Mrs. A. TAYLOR was also 1st for Begonias in hanging baskets, and some nicely-grown plants were staged; Mr. F. TRILBY was 2nd. Mr. SMITH had the finest Gloxinias, and Mr. BARKER the best Ivy-leaved Pelargoniums; Messrs. TAYLOR and BARKER the best double flowered zonals; and Mr. SMITH and Mr. BARKER the best single-flowered zonal Pelargoniums.

Fuchsias were not numerous. Mr. Beech, gr. to Mr. BARKER, had the best lot of plants, and though small in size of plant they were well flowered. Plants for table decoration were well done, and J. BALFOUR, Esq. (gr., Mr. A. Jeffries), had the best, and Mr. BEECH came 2nd.

Cut-flowers occupied a large space, and were exceptionally fine in most of the classes. For Sweet Peas there were three classes, and those of Messrs. ECKFORD were very fine. The best collection of Sweet Peas for the Eckford prizes made a grand display, Mr. HARE, Miss NEWMAN, and Mr. BEECH being the fortunate winners, being 1st, 2nd, and 3rd in the order of their names. For Messrs. McMullen's prizes for the best collection, Messrs. BARKER, EDWARDS, and SMITH were the winners in the order named. For hardy flowers, Miss NEWMAN, Messrs. GOLD, and Mrs. W. GEE were successful. Messrs. PAUL & SON, Cheshunt, had a remarkably fine exhibit of herbaceous perennials as cut flowers; Mr. A. A. HARE was 2nd with smaller bunches. Dahlias were a strong class, and Mr. BARKER, Mrs. TAYLOR, and Mrs. GOLD had the best stands. Roses were not plentiful; Messrs. BARKER, Mr. A. TAYLOR, and Mr. W. G. GOLD had the best blooms.

Fruit, especially that from indoors, was well staged, the baskets of mixed fruit shown by Mr. BARKER and Col. HOUBLON being very fine; the last-named was 1st; Mr. BARKER, 2nd.

Mr. A. JEFFRIES had the best Hamburg Grapes, also the best Black in any other class, staging fine bunches; and Mr. HARRISON, 2nd, the last-named having very fine Muscats.

Some fine Peaches were staged, Sir JAMES BLYTH, Bt., having the best, and Col. ARCHER HOUBLON was 2nd. The best Nectarines came from Sir J. BLYTH (splendid fruits), Col. HOUBLON, and Mr. C. H. DAVIS. There were two very fine collections of fruit, Grapes and Peaches being very good; Col. A. HOUBLON being 1st, and Mr. J. BARKER a close 2nd.

Vegetables were excellent, the 1st prize being well won by Mr. A. JEFFRIES, he having fine Alderman Peas, good Tomatos, Excelsior Onions, and Spon House Potatos; and 2nd, Mr. BEECH, with good dishes.

Table decorations were most interesting. Miss A. F. HARWOOD, Colchester, was 1st, having Tea Roses; 2nd, Miss CAMP, Sawbridgeworth, with Clarkia, and a free use of Jasminum officinale; Miss BLYTH being a close 3rd with Sweet Peas.

Messrs. RIVERS, Sawbridgeworth, showed fruit-trees in pots, receiving a First class Certificate for new Peach

Peregrine; Messrs. PAUL, Cheshunt, had a very fine stand of herbaceous flowers; Messrs. WARE, Feltham, a good collection of hardy flowers; and Mr. A. PERRY, Winchmore Hill, hardy flowers and choice Water-Lilies. Mr. S. MORTIMER, Farnham, exhibited a very fine lot of Dahlias, mostly Cactus varieties, and a new one, Queen Alexandra, for which a First-class Certificate was awarded. G. W.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

AUGUST 14.—The members of the Committee present were Messrs. Gratrix, MacNab, Stevens, Holmes, Parker, Rogers, Keeling, Smith, Cowan, and Weathers (Hon. Sec.). There was a capital display of plants for the month of August.

S. GRATRIX, Esq. (gr. Mr. Cypher), staged a nice group of plants, mainly hybrid Cypripediums. Cypripedium x Lord Derby, Sander's var., received a First-class Certificate (it is a fine handsome flower with very broad petals having a light ground and densely spotted), Cattleya x Pittiana, a fine cross between C. Schofieldiana x C. Rex, received an Award of Merit. Silver Medal for group.

E. ROGERSON, Esq. (gr. Mr. Blomeley), staged a good group, in which were some well-flowered plants of Cattleya Harrisonae, Cypripedium x Rachel (a cross between C. Curtisii x Charleworth), received an Award of Merit. The group was awarded a Silver Medal.

Messrs. CHARLESWORTH, Bradford, had a beautiful collection of plants, which obtained a Silver gilt Medal. Laelio-Cattleya x Adolphus, var. superba (L. cinnabarina x C. Acklandiae), received an Award of Merit; while Cattleya x Iris, var. Fascinator, was voted a First-class Certificate.

C. PARKER, Esq., Ashton-on-Ribble, again exhibited Cypripedium x Cassandra. Mr. A. J. KEELING staged a small group of plants, including Cypripedes and Masdevallias (Vote of Thanks). Messrs. SANDER & SONS, St. Albans, had a good group of Laelio-Cattleyas, &c., for which a Bronze Medal was awarded. Messrs. COWAN & Co., Ltd., received a Vote of Thanks for a small group. P. W.

IRISH GARDENERS' ASSOCIATION.

AUGUST 12.—The second excursion of the season organised by this Society took place on the above date to Carton, the seat of the Duke of Leinster, at Maynooth. Leaving Dublin at noon, the members were met on their arrival at Maynooth by Mr. Black (under whose supervision the gardens are), and conducted over the demesne, extending to about a thousand acres. There is much to interest devotees of flora and sylvia at this historic seat. Many fine Conifers are here, and open grassy woodland glades afford delightful prospects. Hardy herbaceous plants are grown in enormous quantities, and the variety and extent of the collection were the subject of much comment.

Flowering shrubs, too, are a feature, and include many interesting and rare sorts. The ornamental waters, the pergola, and the various glasshouses all contributed to the enjoyment and instruction of the visitors. Maynooth College was visited; nor were the various objects of antiquarian interest which the neighbourhood affords neglected.

Obituary.

WALTER JARMAN.—We regret to announce the death, in his fifty-fifth year, of Mr. Walter Jarman, head gardener to Mr. Brassey, Preston Hall, Aylesford, Kent, which took place on Monday evening, the 10th inst. For a period of fourteen years he was head gardener to H. Herepath, Esq., Westwood House, near Margate, where he carried out the re-modelling and planting of the garden. After the death of his employer, he entered the service of Joseph Farmer, Esq., Chapel Hill House, Margate, where he made many alterations and superintended the erection of the extensive glasshouses. Here he remained for seven years, and entered the service of Mr. Brassey about twelve years ago.

Mr. Jarman assisted in starting the Isle of Thanet Chrysanthemum Show, and was an exhibitor at most of the leading shows in East Kent, and during his stay at Westwood House, took many of the leading honours at the Crystal Palace fruit shows for Grapes. He was Secretary of the Aylesford Allotment Society.

The deceased had been ailing for about five months, and a few weeks ago it was discovered

that he was suffering from cancer. He leaves a wife and nine children to mourn his loss, the youngest being eight years old.

MRS. HARRY CANNELL.—We regret to hear of the sad trouble that has befallen Mr. Harry Cannell, second son of Mr. Henry Cannell, of Swanley, by the death of his wife, in her thirtieth year, on the 17th inst.

Remarks.—Dull weather, with cold, gusty winds, have been the prevailing feature of the past week, with an occasional burst of bright sunshine, and rain on five days.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending Aug. 15, is furnished from the Meteorological Office:—
 "The weather during this week was of an exceedingly unsettled character, steady rains or heavy passing showers alternating with comparatively fair intervals. Thunderstorms occurred in most parts of the kingdom, and in some localities were accompanied by hail.

"The temperature just equalled the normal height in England, E., but was 1° or 2° below it in all other districts. The highest of the maxima (registered either on the 9th or 13th) ranged from 74° in the Midland Counties and England, S., and S.W., and 73° in Scotland, N., to 69° in the other Scotch districts, and to 68° over Ireland. The lowest of the minima, which were recorded on somewhat irregular dates, varied between 51° in the Channel Islands and 38° in Scotland, N., and Ireland, N. In the other districts the lowest readings were a little below or slightly above 40°.

"The rainfall exceeded the mean in all districts excepting England, N.E., the excess being either considerable or very large. Several places again had more than an inch in twenty-four hours. At Gelderton on Tuesday there was as much as 1.72 inch, and at Markree on Friday 2.04 inches.

"The bright sunshine was deficient over the kingdom as a whole, but slightly in excess in a few localities. The percentage of the possible duration ranged from 52 in the Channel Islands and 43 in England, S.W., to 26 in Scotland, E., 25 in Ireland, N., and 24 in Scotland, N."

THE WEATHER IN WEST HERTS.

Cold, Wet and Gloomy.—The present cold, wet and gloomy spell has now lasted over five weeks. During that period on only three days has the temperature in the thermometer-screen exceeded the average, while on as many as seven nights the exposed thermometer has fallen to within 8° of the freezing point. The ground is now 1° colder at 2 feet deep, and 2° colder at 1 foot deep than is seasonable. Throughout the past

five weeks rain has fallen on all but eleven days, and to the total depth of 5½ inches—equivalent to a watering on each square yard of surface in my garden of 24½ gallons. Of that amount about 13½ gallons have passed through the bare soil percolation gauge, and nearly 3 gallons through the gauge covered with short grass—the latter being a very unusual circumstance at this season. On two days the sun shone brightly for about ten and a half hours a day, but during the rest of the week the record of sunshine proved very poor averaging but little more than three hours a day. The winds, although variable, were, taking the week as a whole, of more than average strength; while the atmosphere in the middle of the day was again humid for a summer month. E. M., Berkhamsted, August 18, 1903.

MARKETS.

COVENT GARDEN, August 20.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. ED.]

			Watercress, per dozen bunches	0 4	0 6

REMARKS.—Soft fruits are now over for the season. Vegetable Marrows fetch very low prices; Aubergines, per doz. 2s.; Corn Cobs, per doz. 2s. 6d.; out-of-door Mushrooms sell per half-bushel at 1s. 1s. 6d. Most of the Plums and Pears now seen are foreign. Tomatoes are very plentiful and low in price. Foreign Pears are Duchesse, Beurre Clairgeau, and Williams Prince Chrétien. Our home grown Plums are Orleans, Bon of Wales, Czar, Victoria, &c. The bag Peas are Yorkshire grown.

POTATOS.

Home-grown, 70s. to 100s. per ton. John Bath, 32 & 34, Wellington Street, Covent Garden.

FRUITS AND VEGETABLES.

GLASGOW, August 17.—The following are the averages of the prices during the past week:—Apples, Lisbon, 12s. to 15s. per case; Oranges, Naples, 9s. to 12s. per box; Lemons, 6s. 6d. to 10s. per box, and 10s. to 14s. per case; Melons, 6s. 6d. to 9s. per case; Grapes, English, 1s. 3d. to 2s. 6d. per lb.; do., Denia, green, 5s. to 7s. per barrel; do., black, 11s. to 13s. per barrel; Strawberries, 4d. to 10d. per lb.; Plums, French, 2d. to 6d. do.; do. Gages, 7d. to 9d. do.; Irish Warrington Gooseberries (rather over-ripe for preserving), 24s. per cwt.; Pears, 2s. 6d. to 3s. 3d. per sieve; Tomatoes, 5d. to 8d. per lb.; Mushrooms, 1s. to 1s. 6d. do.; Onions, 3s. 6d. to 5s. per case; White do., 3s. 6d. per bag; do., Eschalots, 4s. do.; Carrots, 8s. per hamper.

LIVERPOOL, August 17.—The following are the average of the current prices during the past week—prices varying according to supply.—Wholesale Vegetable Market.—Potatoes, per cwt. Early Regents, 2s. 9d. to 3s. 6d.; Kidneys, 4s. to 5s.; British Queen, 3s. to 4s.; Turnips, 8d. to 10d. per 12 bunches; Swedes, 3s. to 3s. 3d. per cwt.; Carrots, 6d. to 10d. per dozen bunches; Onions, foreign, 4s. 8d. to 5s. per cwt.; Parsley, 4d. to 6d. per dozen bunches; Lettuces, 6d. to 8d. per dozen; Cucumbers, 1s. 6d. to 2s. 6d. do.; Cauliflowers, 1s. to 2s. do.; Cabbages, 6d. to 1s. do.; Celery, 1s. 9d. to 2s. 3d. do.; Peas, 3s. to 4s. 6d. per hamper; Beans 2s. to 2s. 3d. do. St. John's—Potatoes, 1s. to 1s. 4d. per peck; Peas, 1s. to 1s. 6d. do.; Cucumbers, 3d. to 6d. each; Gooseberries, 3d. to 4d. per lb.; Currants, Red, 6d. do.; Peaches, 4d. to 6d. each; Filberts, 8d. per lb.; Grapes, English, 1s. 6d. to 2s. 6d. do.; do. foreign, 6d. to 8d. do.; Pines, foreign, 4s. 6d. to 6s. each; Mushrooms, 10d. to 1s. per lb. Birkenhead:—Potatoes, 1s. per peck; Peas, 10d. to 1s. 4d. per peck; Cucumbers, 2d. to 4d. each; Currants, Red, 6d. to 8d. per lb.; Cherries, 6d. to 8d. do.; Gooseberries, 4d. do.; Grapes, English, 1s. 6d. to 4s. do.; do. foreign, 6d. to 8d. do.; Tomatoes, English, 6d. to 8d. do.; Mushrooms, French, 6d. to 1s. do.; Filberts, 8d. do.

CORN.

AVERAGE PRICES of British Corn (per Imperial qr.), for the week ending August 15, 1903, and for the corresponding period of 1902, together with the difference to the quotations. These figures are based on the Official Weekly Return:—

Description.	1902.		1903.		Difference.
	s.	d.	s.	d.	
Wheat	31	7	29	11	— 1 8
Barley	24	9	21	3	— 3 6
Oats	22	2	18	10	— 3 4

ANSWERS TO CORRESPONDENTS.

APPLES AND PEARS: G. M. W. Yes; the unfolding leaf serves to distinguish them. The Apple-leaf, as you say, unrolls on one side; the Pear on both sides; but we never heard that the name "Pear" had anything to do with that circumstance. Is a pun intended? Nor can we see the association with the "evening shadows."

APPLE GRUB: H. J. The grub or larva of the Leopard moth, *Zeuzera aesculi*. You can hook out the creature with a curved wire, or inject some kerosene into the hole.

BOILER FOR HEATING GLASS STRUCTURES: Perplexed. Choose a sectional boiler (see our issue for March 7 of the present year, p. 156), capable of heating, without using an excessive amount of fuel in severe weather or making the pipes unduly hot, six rows of 4-inch pipes in the vinery and stove, two flow pipes and one return pipe in the greenhouse, and one flow and one return in the pits. The vinery being a lean-to, should have four of the pipes running along the front and two just about the middle of the house, and raised about 1 foot off the border. If the vinery stands apart from the other houses, the pipes may be carried round the ends as well as the front, and in any case that would be advisable for unconnected houses, forcing or other.

BOOKS: Cornubian. See the book reviewed in our columns last week, p. 124, *Students' Text-Book of Botany*, by Vines (Sonnenschein).—C. & C. *Vegetable Physiology*, Reynolds Green (London: Churchill); *Lectures on the Physiology of Plants*, S. H. Vines (London, Clay & Son), and many smaller books.—J. C. *Table Decorations*. We know no recent work on this subject. Miss Hassard's, was a good one in its day, but is out of print, besides being rather old-fashioned. If you know the German language, there are several that might serve your purpose.—*Constant Reader*. Obtain of Mr. Upcott Gill, Bazaar Office, Drury Lane, *Popular Bulb Culture*, by W. D. Drury; price 1s.

CORRECTION: Mr. Brotherston writes to express his regret that a mistake should have occurred in his article relating to an alleged statement of Mr. Britten's. "Galium verum," and not "G. Aparine," appears in both the works named.

CORRECTION: "PLYMOUTH PINE."—In the report of the meeting of the Royal Scottish Arboreal Society, "Plymouth Pine" should be read as "Weymouth Pine"—P. Strobos.

FUNGUS ON HOLLYHOCKS: J. P. Bordeaux-mixture or weak Condy's-fluid are useful, but you would do well to destroy by burning every plant, and to abstain from the cultivation of Hollyhocks for a few years, or rely on seedlings raised annually, burning them when they have bloomed or become a prey to the parasite.

GRASSHOPPER: W. S. The common green grasshopper. It does not exist in sufficient numbers to do much mischief.

NAMES OF FRUITS: One Peach in a chip box, no letter accompanying it. Smashed beyond recognition.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—C. B., Brintree. *Catsetum Russellianum*.—J. D. B. 1, *Rhododendron ponticum variegatum*; 2, *Buddleia variabilis*; 3, *Metrosideros*; 4, *Kennedyia Marryattia*; 5, not recognised, send when in flower; 6, *Cotyledon*.—W. B. *Campanula isophylla*, white variety.—T. B. *Cyrtanthera magnifica*; 2, *Farfugium grande variegatum*; 3, *Polypodium aureum*.—E. P. & Co. The so-called Calvary Clover, *Medicago echinus*.—A. Bullard. 1, *Pontederia crassipes*; 2, *Artemisia vulgaris*; 3, *Rubus odoratus* (purple-flowering Raspberry); 4, *Rosa rubrifolia*; 5, *Campanula pulla* var. alba; 6, *Desprez* with yellow flowers; 7, *Geranium Andressii*; 8, *Campanula pusilla* (syn. *pumila*).—A. T., Catford. Why send such

wretched specimens? 1, *Choisya ternata*; 2, *Viburnum Opulus*; 3, not recognised; 4, probably *Staphylea pinnata*; 5, *Cupressus Lawsoniana lutea*; 6, *Buddleia Lindleyana*.—F. McD. 1, *Centranthus ruber*; 2, *Sedum carneum variegatum*; 3, a *Magnolia*, no flowers; 4, a *Cornus*, no flowers.—W. W. 1, *Lysimachia clethroides*; 2, *Saponaria officinalis*; 3, *Maranta*; 4, *Cassinia fulvida*; 5, *Salix rosmarinifolia*; 6, *Pyrus Aria*.—J. McK. An ordinary variety of *Cattleya Warscewiczii*, often called *C. gigas* in gardens.—*Northampton (no letter)*. 1, *Hæmanthus puniceus*; 2, *Bignonia radicans*; 3, *Agrostemma coronaria*.—*Hants*. *Cattleya intermedia*, but with peculiar features.—A. B. *Erigeron canadensis*, *Lycopis arvensis*.—J. B. *Pyrus Aria*, and an *Amelanchier*.—F. M. W. We do not know the *Rose*.—*Orchid*. 1, *Erica arborea*; 2, *Menziesia polifolia*; 3, *Menziesia polifolia alba*; 4, *Cyperus laxus*.—*Buxted*. 1, *Cattleya Loddigesii*; 2, *Oncidium flexuosum*; 3, *Selaginella caesia*; 4, *Selaginella Wildenovii*; 5, *Adiantum formosum*; 6, *Diplazium alternifolium*.—*Hortus*. 1, *Lomatia silaifolia*; 3, *Centradenia rosea*; 3, *Hoffmannia Ghiesbreghtii variegata*; 4, not recognised.—G. S. 1, *Clerodendrum trichotomum*; 2, perhaps *Pawlonia imperialis*; 3, *Eugenia Ugni*; 4, perhaps *Centaurea macrocephala* (send when in flower); 5, *Eryngium alpinum*; 6, *Eryngium amethystinum*.—W. W. 1, *Codiaeum irregulare*; 2, C. *Weissmanni*; 3, C. *Johannis*; 4, C. *longifolium*; 5, C. *trilobum*; 6, C. *interruptum*.—C. A. V. 1, *Thuyopsis dolabrata*; 2, *Buxus communis*; 3, *Piptanthus nepalensis*; 4, *Retinospora filifera*; 5, *Abies Pinsapo*; 6, *Cryptomeria elegans*.—S. K., *Bungay*. *Hymenocallis littoralis*. *Hymenocallis* are generally called *Pancreatium* in gardens.

MELON AND TOMATO FOLIAGE: J. A. B. The first-named is affected with the "spot" disease often mentioned in these pages in recent issues; and the second with *Peronospora Lycopersici*, against which you may, when first observed, use the Bordeaux-mixture with success.

PALM ROOTS: *Nonsuch*. The roots were quite withered. We cannot say what is the matter. Send better specimens properly packed.

PEACH: A. Bateman. Greatly damaged in transit, and we cannot identify the variety.

PEACH - LEAVES INJURED: L. M. Shot-hole fungus. See answer to W. Priest in our last issue.

POTATOS: *Constant Reader*. The brown spot is due to a Potato fungus, of which there are several. Spray with Bordeaux-mixture as often explained. The "early curl" is no doubt occasioned by cold.

PROLIFERATED ROSES: S. Bernard. Very common. They are due to some change of growth occurring at a particular period from seasonal causes. You can do nothing to prevent it.

RATING OF GLASSHOUSES USED FOR TRADE PURPOSES: J. P. Land on which there are buildings, glass or otherwise, are rated higher than that on which there are no buildings. A few years ago the rates paid on such land were much lower. We would advise you to consult a solicitor.

SWEET PEAS: Will the correspondent who sent us last week a few new varieties of Sweet Peas kindly send his name and address?

THE FERN BULLETIN: W. F. C., San Francisco. This is published quarterly by W. A. Clute, Binghamton, New York.

PAST AND FUTURE IN THE GARDEN.

AS the autumn approaches, the thoughtful gardener will take advantage of this more or less restful season in the garden to take stock of the results of his labours during the past season, and of the condition of the garden in the various departments under his charge. Improvements in the following year will be suggested by the failures and their causes in the past.

The year has now so far advanced that the gardener will soon be able to come to a conclusion as to the results he has or is likely to obtain in the various departments under his charge. A review may therefore be profitably taken of the season's work in the fruit department under glass, to ascertain whether the Vines have given us the return in quality and weight of fruit we had hoped for and anticipated from them. It may be that we have to decide on the replanting of a vinery in consequence of a failure through one cause or another. Other Vines may not have come up to our expectations, entailing perhaps the restriction and partial remaking of the border. It may be that the Peach-trees, the Cherries, the Figs, and other fruit-trees have shown signs of distress through age or in consequence of some adverse conditions. The present, then, is the time to

form conclusions as to what has been the cause of our disappointment, and to decide on the remedy.

There are few seasons in which some new fruits are not temptingly dangled before the grower's eyes, and few resist the temptation of trying one or more. It may be a Grape, a Peach, an Apple, a Melon, a Tomato, or what not. The time has now come when it is possible to form an estimate of their merit, and to decide whether they are to be retained for future supplies, or discarded.

It will soon be time to overhaul the glass structures as regards their condition as to repairs and painting. There is no time so well adapted for this work as the autumn, when the houses are empty. It is a seasonable time also for examining boilers, pipes, and valves, and for renewing and repairing them if needful. Then is also the most convenient time to inquire into the condition of the bothies—as to cleanliness and comfort, and especially to see that the bedrooms are provided with the necessary means for securing warmth and comfort in the winter.

In the hardy fruit department, some of the wall and other trees may have fallen into bad ways; notice must be taken of these, and provision made to improve their conditions.

The bush-fruit tree quarters and Strawberries must come in for critical inspection, and if signs of falling away in any respect are apparent, then means must be provided to arrest this failing by the best remedy which suggests itself, according to the cause of failure.

A review at the present time of the results which have attended our labours in the kitchen garden during the past remarkable season cannot but be profitable. In this department there is ample scope for reflection as to the success of the various crops, and also as to the merits of the many new varieties which have been under trial. The conditions for any improvements which reflection may suggest, whether in relation to crops the quantities or varieties to be grown, are much more easily decided upon when the work is anticipated and arranged for, whilst examples of the year's work are actually before us, than when they have faded from view into the dim distance.

Time will also be well spent in reviewing work in the flower-garden during the past season. It is now much easier to detect flaws and errors while the plants are in full bloom and other occupants of the beds in full foliage, than it will be later on when the beds are bare. It is so much easier now to suggest and determine on any improvements which it may be possible to introduce into this department of the garden the following year, whether it be in the introduction of some new and effective plant for bedding or in improved combination and association of other plants. No opportunity should be lost sight of to make this aspect of the garden, however small it may be, as interesting, bright, and beautiful as it is possible to make it; remembering that in the majority of cases it is situated within the sight of its owners all the day long.

Herbaceous borders have been so improved of late years in interest and beauty by the introduction of many new and hardy plants, and also by the greater attention given to

improved arrangement and association of the immense wealth and variety of these beautiful plants now available for the gardener's service, that they are worthy the closest attention, and now is the time to see them at their best.

The lawn, the pleasure-ground, and the woodland will well repay any attention they may receive at the gardener's hands at the present time. Trees grow rapidly, and without due attention to pruning and thinning valuable specimens soon injure one another past redemption. Double or treble leaders may be forming on some of the choice Conifers, and if not removed in time will disfigure the growth of the tree for years to come.

New Conifers and other hardy foliage and flowering trees and shrubs of great ornamental value and interest are constantly being introduced, and to those to whom the Pinetum appeals and gives pleasure, the addition of an occasional new introduction is a source of great interest.

It will soon be time for planting early bulbs; and in association with these what possibilities of effect are opened out, and what visions of beauty rise to the mind when we remember the various ways in which their services can be requisitioned, whether in the flower-garden or mixed border, but more especially in gardening in the grass! Those who have not already embarked in this delightful aspect of out-of-door gardening would not be long in doing so did they know the rich store of interest and pleasure waiting for their enjoyment, and that at a comparatively trifling cost. O. T.

GUNNERSBURY HOUSE.

In the Japanese garden at Gunnersbury House the other evening I noticed the very distinct *Hydrangea quercifolia* in flower. In a cool, half-shady place it was very distinct and effective. The large-lobed leaves have a certain resemblance to Oak-leaves, but are more hispid or hairy and of a dead olive-green shade. The paniculate inflorescence reminds one of that of *H. paniculata*, but the aborted flowers are whiter and larger and more shapely in their way. The abortive flowers, by the way, in *Hydrangea*, *Viburnum*, &c., are of course the showy ones from a garden point of view. The beauty of the showy flowers is, in this species, intensified by the centre of the inflorescence being densely filled with tiny apple-green buds and small Spiræa-like flowers of quite another character. Although this plant may not generally prove to be so showy as *H. Mariesi* and *H. M. alba*, it nevertheless deserves a place in the rock, Japanese, or bog-garden, as a distinct companion to *Rodgersia*, *Bamboos*, and other Japanese vegetation.

Now I am writing, I should like to say how very rich and beautiful the lawns, gardens, and lake at Gunnersbury House really are at the present time. The Nymphæas or Water Lilies alone are well worthy of a long journey to anyone who, like myself, is interested in these charming flowers. All M. Latour Marliac's best seedlings are represented in the cold water, along with one or two of the hardier of the blue-flowered kinds.

In an open-air tank, slightly heated by a 4-inch hot-water pipe passing round its bottom, the Eastern Lotus, or *Nelumbium*, is vigorous and healthy, and its first flower-buds are about to expand above the soft, parasol-like leaves. The tank-margin itself is concealed by grasses and other appropriate aquatic vegetation. Along the front angles is a rich border of *Pontederia (Eichornia) crassipes*, which quite recently bore

three or four hundred of its erect spikes of soft blue-purple flowers. This plant has long been grown in botanic gardens as furnishing an example of swollen petioles, hence perhaps its popular name of "The Fishing-float Plant," but it rarely flowered under hot-house cultivation, although its first cousin, *Eichornia azurea*, often flowers freely under glass. *E. crassipes* is "The Water Hyacinth," so often alluded to in the newspapers as forming a kind of "sud" and blocking river steamers on the Amazon and its tributaries in South America. It also has proved a nuisance in Queensland and elsewhere

4-inch hot-water pipe concealed in the mud at the bottom. The tank is covered by a wooden glass-covered frame, the lights of which can be raised for ventilation or other cultural purposes. The leaves are large and rich green in colour, with indented margins, and the buds expand at the water-line; but eventually the stalks become erect, and the great flowers are raised a foot to 18 inches above the water, thus giving them a very stately appearance. The flowers themselves open dark blue with an orange centre, but as they reach their utmost expansion of 8 to nearly 11 inches the colour becomes of a

the blue Egyptian Lotus (= *N. stellata*), *N. s.* Berlin variety, and *N. s. pulcherrima*, the finest perhaps of the *N. stellata* group or series. There are also the American seedlings, Mrs. Ward and William Stone; but beautiful and fragrant as these undoubtedly are, none can for a moment be compared to advantage with *N. gigantea*. Mr. Hudson recently received a First-class Certificate for a seedling of *N. gigantea* raised at Gunnersbury; and well it deserved the honour awarded. Will it hybridise with African, European, or American kinds? That it varies from seed, the certificated variety *N. g. Hudsoni* amply proves.

FIG. 54.—FIRST PRIZE EXHIBIT OF DAHLIAS IN CLASS 57 AT SHREWSBURY, FROM MR. W. TRESEDER, CARDIFF, HAVING A FRONTAGE OF 10 FEET 6 INCHES. (SEE P. 151.)

when introduced into streams. The effect of the plant at Gunnersbury is good, whether in flower or not, and there is perhaps one little point about its flower-spikes worth recording, viz., that though its inflorescence is quite erect until the last flower fades, it then bends downwards, burying its young seed-vessels in the water, a habit probably of service in its South American home as a protection against vegetable-feeding animals or birds.

Finest of all the Water-Lilies at Gunnersbury, however, is the "Queen Water-Lily of Queensland," *Nymphaea gigantea*. It is difficult to keep calm and critically sober in the face of so noble and exquisite a flower. It is grown at Gunnersbury in a shallow tank, the water of which is slightly heated by a flow-and-return

paler hue—soft blue, with a glistening lustre like fine old satin. Each flower consists of the usual four or occasionally five greenish sepals and several whorls of flattened petals which imbricate, and ultimately reflex slightly around a central boss of golden-yellow stamens which recalls that in the single white-flowered Chinese Peony. Mrs. Rowan, the lady who made sketches of many lovely Australian flowers, startled some of us in her book by describing the flowers of this heavenly blue Water-Lily as being "as large as soup-plates"; but she was quite right, and the flowers now in bloom at Gunnersbury are much finer than the late Miss Marianne North's picture of them painted in Australia and now at Kew.

Beside this kind at Gunnersbury are growing

Shall we ever get a race of really hardy blue Water-Lilies for our cold-water ponds and streams? The beauty of the Australian visitor at Gunnersbury House, and its grateful response to a genial cultural welcome, seems in any case to open up vistas of blue water-flower beauty of the finest kind.

Apart from Water-Lily ponds or lakes and pools, there is much else to see at Gunnersbury—Roses, Tea Roses, China Roses, old Roses, and Roses new, of all the best kinds. The terrace is bounded on the lawn side by Pomgranates, scarlet, and the still rarer white-flowered variety amongst them, with sweet-scented Verbena (*Aloysia*) and Myrtles of varied kinds, with the blue of *Agapanthus*, the vivid scarlet of *Tropæolum* and *Salvia*, *Pelargonium* and

Fuchsia, and the homely fragrance of banks of the dear old scented Cape Pelargonium, beloved of other and more simple social days. There are noble Cedars and Elms, glints of velvety lawns and water through the trees, such Hydrangeas in tubs as one can only see elsewhere in Cornwall or in the south and west of Ireland. An Hydrangea in a tub that measures 8 feet high and 10 feet through and bears hundreds of its soft green and rosy flower-heads is worthy of respectful consideration.

No visitor privileged to see Gunnersbury can forget the *Magnolia conspicua* of spring, or the quaint old standard, near the house, of *M. grandiflora*.

SHREWSBURY.

In our present issue we are enabled to publish some photographs taken specially for this Journal by Mr. Thurtle, of Shifnal, at the great show of the Shropshire Horticultural Society held at Shrewsbury last week. Fig. 54 represents the 1st prize exhibit of Dahlias, shown by Mr. William Treseder, nurseryman, of Cardiff, which was greatly admired for its general good effect. This firm frequently exhibits Dahlias, and although the flowers have usually to travel a great distance, as, for instance, when exhibitions are held in London, they are usually successful in winning prizes.

conjunction with a much larger group of Gloxinias.

In fig. 57 is illustrated an exhibit of Carnation flowers that won 1st prize for Mr. A. F. Dutton, nurseryman, of Bexley Heath, Kent. We have had occasion several times already this season to refer appreciatively to the quality of the flowers, and to the effective arrangement conspicuous in Mr. Dutton's exhibits at the Temple Show and at the Drill Hall. Though Mr. Dutton has been only two seasons in his present nursery, which was already provided with glass-houses, he has worked up a stock of 40,000 plants. He has four span-roofed houses,

FIG. 55.—BEST GROUP OF COMPETITIVE TUBEROSUS-ROOTED BEGONIAS AT SHREWSBURY, SHOWN BY MR. FRED DAVIS, AN AMATEUR.

flora in autumn. The latter tree is noble and laurel-like, with great ostrich-egg-shaped buds, and flowers that, when fully expanded after a hot day in August, remind one of pure white fantail pigeons nestling cosily amongst the great glossy leaves.

The Ivy-leaved Pelargoniums and Fuchsias in pots, the borders gay with Heliotrope, Celosia, Aconite, Tritoma, and other flowers, the fruit-tree houses and the Orchids, must await "a more convenient season." Thanks to my old friend and fellow-student at the Royal Horticultural Society's examinations, I enjoyed the privilege of a look round these gardens retired and beautiful; but apart from any questions of personality and good fellowship, they are exceedingly beautiful and fair to see.
F. W. Burbidge.

An excellent group of tuberosus-rooted Begonias is shown in fig. 55. This exhibit won 1st prize from such renowned firms as Messrs. Blackmore & Langdon, of Twerton Hill, and Mr. Davis, of Yeovil. It is especially remarkable, because, as we are informed by a correspondent, Mr. B. G. Stanley, the exhibitor, Mr. Fred Davis, Woolashill, near Porshore, is quite an amateur, being a farmer high up on the side of the Bredon hills. Some five or six years ago Mr. Davis caused considerable surprise by winning important prizes at Birmingham for Chrysanthemums. His exhibit of Begonias at Shrewsbury was as good as any we have ever seen. Another exhibit of Begonias is shown in fig. 56. In this case the flowers are all single, and belong to a type that develops crests on the petals. The exhibit was made by Messrs. Sutton & Sons, of Reading, in

150 feet long by 25 feet wide each, containing blooming plants in 6-inch pots. One house, containing 3,000 plants of the variety Mrs. Thos. W. Lawson, is typical of the other three. It is now an excellent show, although flowers have been cut from them since September, 1902. Mr. Dutton estimates that he has cut 10 or 12 blooms from each plant in the year. In the remaining house, containing blooms for cutting, are the following varieties:—Melba, Royalty, G. H. Crane, Cambridge White, Queen Louise (white), Cambridge Clove, Floriana, Sybil, &c. Strict attention is paid to disbudding, and the compost used, even for the young stock, contains much prepared manure.

The two remaining photographs on pp. 160, 161 illustrate the 1st and 2nd prize exhibits in the Champion Grape Class for twelve bunches. The

st prize exhibit, from the Earl of Harrington (gr., Mr. Goodacre), contained none but first-rate varieties. They were as follows: Back row, reading from right to left (1 to 6), Black Ham-
burgh, Madresfield Court, Muscat of Alexandria, Madresfield Court, Muscat of Alexandria, and Muscat Ham-
burgh; front row, reading from right to left (7 to 12), Muscat Ham-
burgh, Muscat of Alexandria, and Muscat Ham-
burgh. By referring to the table of points in our

Alexandria, Alnwick Seedling (2), Muscat of Alexandria, and Black Alicante.

On the first day of the exhibition the weather was delightful, and the receipts at the gate amounted to £983 19s. 9d., being only £20 less than last year's record figure. On Thursday, the second day, however, rain fell continuously, and the receipts were only £1,357, compared with £1,918 last year, and £1,690 in 1901. The total receipts, it is expected, will meet all expenses, and leave a small balance on the year's working.

expedition to Hantam, where *C. tomentosa* was collected.

Thunberg's description, given below,* is not a very good one, but agrees very well with Masson's specimens; so there can be little doubt the identification is correct. During the last two years a *Crassula* has flowered twice at Kew, which I find upon comparison to be the same as Masson's specimens of *C. tomentosa*; and as the latter is only imperfectly described, I here give a more complete description, taken from the living

FIG. 56.—A GROUP OF CRESTED BEGONIAS SHOWN AT SHREWSBURY BY MESSRS. SUTTON AND SONS, READING. (SEE P. 151.)

report last week, each bunch may be identified by its number. Messrs. D. & W. Buchanan, of Kippen, N.B., who were 2nd, as last year, had four remarkable bunches of Muscat of Alexandria, three of which were awarded the maximum number of points. The other gained 10½ points, and is the bunch of Muscats nearest to the left hand in the back row. The exhibit contained too few first-class varieties to win 1st prize. The varieties were, front row, reading from right to left, Alnwick Seedling, Muscat of Alexandria, and Cooper's Black (2), Muscat of Alexandria and Cooper's Black. Back row, reading from right to left, Black Alicante, Muscat of

NEW OR NOTEWORTHY PLANTS.

CRASSULA TOMENTOSA, Thunb.

This plant is interesting as being one among many that were collected in South Africa by Thunberg about 130 years ago, which have remained practically unknown ever since. In 1897, however, it was pointed out by Messrs. Baker and Britten, in the *Journal of Botany* for that year, p. 481, that there were specimens of this species in the British Museum which were collected by Masson, who travelled with Thunberg on his

plant, which is remarkable for the great difference between the form and arrangement of the leaves of the barren rosettes and those of the flowering stems.

A perennial herb, 6—15 in. high when in flower, but only 2—3 in. high when not flowering.

* *Crassula tomentosa*, Thunberg in *Nov. Act. Phys.-Med. Acad. Caesar. Leopold-Carol. Nat. Cur.*, vol. 6, p. 333 (1778).—“Foliis connatis, lanceolatis, villosis, ciliatis, caule subnudo; floribus verticillatis. Crescit in Hantam. Floret Octobri. Novembri. Folia radicalia oblongo-lanceolata, obtusiuscula, connata, hirsuta, ciliata, imbricata, pollicaria; caulina trium parium, minora. Caulis angulatus, erectus, villosus, pedalis. Flores verticillati.”

branching at the base, where the main stem varies from $\frac{1}{4}$ — $\frac{1}{2}$ in. thick. Leaves of the barren rosette $\frac{3}{4}$ — $1\frac{1}{2}$ in. long, $\frac{3}{4}$ — $1\frac{1}{8}$ in. broad, $\frac{1}{8}$ in. thick, orbicular-ovate to broadly cuneate-ovate, very broadly rounded at the apex, connate at the base, crowded, distichous, but being alternately developed to the right or left, they form a subquadrate rosette, with the young leaves erect and the older spreading or recurved, flat above, slightly convex beneath, or when old and recurved they become convex above and concave beneath, fleshy, bright-green, softly pubescent (almost velvety) on both sides, ciliate

site bracts or some of the lower clusters pedunculate and capitate, forming a long, narrow, interrupted inflorescence. Bracteoles about $1\frac{1}{2}$ lin. long, $\frac{1}{2}$ — $\frac{3}{4}$ lin. broad, puberulous beneath, glabrous above, ciliate. Sepals 1 — $1\frac{1}{4}$ lin. long, $\frac{1}{2}$ — $\frac{3}{4}$ lin. broad, oblong, obtuse, convex and thinly puberulous on the back, flat and glabrous on the inner face, ciliate, green. Corolla white, gamopetalous! 5-lobed, glabrous; tube $\frac{3}{4}$ lin. long; lobes $1\frac{1}{2}$ lin. long, $\frac{3}{4}$ lin. broad near the base, ovate-lanceolate, constricted at the base, tapering in the upper part into recurving subacute tips. Stamens 5, shorter than the

wired-in enclosures of 20 or 30 yards square. But can fowls under such circumstances be kept at a profit? I am satisfied that in nine cases out of ten they are kept at a loss. Why is it, then, that so many are maintained? They are kept as a hobby, and any loss that is made is more or less compensated by the pleasure of possessing such live-stock and securing home-laid eggs warm from the nest.

There is, however, one way, and I believe only one, by which a few fowls can be kept at a certain profit, although closely confined, and if it were more generally practised, the number of suburban

FIG. 57.—FIRST PRIZE EXHIBIT OF CARNATION FLOWERS SHOWN AT SHREWSBURY BY MR. A. F. DUTTON, BEXLEY HEATH, KENT. (SEE P. 151.)

with soft spreading hairs $\frac{1}{2}$ — $\frac{1}{3}$ lin. long. When about to flower the leaves change their form and become spaced out; the lower are 1 — $2\frac{1}{2}$ in. long, $\frac{1}{4}$ — $\frac{3}{4}$ in. broad, varying from cuneate-oblong to elongate-oblong or lanceolate-oblong, obtuse or subacute, connate at the base into a sheath $\frac{1}{3}$ — $\frac{1}{2}$ in. long; the upper stem-leaves become gradually smaller, so that those at the base of the flowering part are not more than 5 — 9 lin. long and 3 — 4 lin. broad, passing into the bracts: all are pubescent and ciliate like the leaves of the barren rosettes. Flowering stems terminal, terete, with internodes $\frac{1}{2}$ — 2 in. long, softly pubescent, with short, spreading hairs. Bracts similar to the upper leaves but gradually smaller and glabrous above. Flowers in 5 — 8 small, compact, distant clusters $\frac{1}{4}$ — $\frac{3}{8}$ in. in diameter, all sessile in the axils of the oppo-

corolla; filaments filiform, glabrous, whitish, anthers yellow. Hypogynous glands about $\frac{1}{2}$ lin. long, broadly cuneate-ovate, truncate or slightly emarginate, orange. Carpels tapering upwards, glabrous, green; stigma oblique. N. E. Brown.

SUBURBAN POULTRY KEEPING.

THE number of suburban poultry-keepers has increased enormously during the past fifteen years, and it has been estimated that fully one-third of the eggs produced in this country are now obtained from this source. Suburban residents living in detached or semi-detached villas are, as a rule, obliged to confine their feathered stock within very narrow limits, such as small

poultry-keepers might yet be increased tenfold. Instead then of attempting to rear chickens, or to keep any adult fowls all the year round in confined enclosures, let the poultry-yard be tenanted with stock for six months only, from the middle of February to the middle of August. Purchase in February, say, a dozen pullets or one-year-old hens of a non-sitting breed, such as leghorns, andalusians, or minorcas. During the following six months these fowls will lay quite four-fifths of the eggs that can be expected from them if kept the full twelve months. We therefore get a maximum of eggs during these prolific egg-laying months at a minimum cost of food and labour of attending. The fowls when bought in may cost from $2s. 6d.$ to $3s. 6d.$ each, and when sold out in August will commonly

realise from 1s. 9d. to 2s. each, as they will then be in good condition for killing. All surplus eggs laid during the summer should be dropped into water-glass, lime pickle, or otherwise preserved for autumn and winter use. By adopting this simple plan you escape the six unprofitable months in all poultry-yards; and in too many instances the handsome profit made during the spring and summer months is more than eaten up during the autumn and winter. Again, very few people are successful in keeping fowls in small enclosures, however well attended, in either health or profit, for twelve consecutive months, to say nothing of the increased labour and misery of attending to such stock in all weathers through our inclement winters.

No fowls produce so many eggs during the laying season as those confined in suburban runs. This is owing to the better care and attention which they receive, the shelter afforded, and the table-scrap food, which is so conducive to egg-laying. The best varieties of fowls for egg-laying are now so generally and largely bred throughout the length and breadth of our land that there can be no difficulty in securing a dozen head or so of suitable stock, and at a moderate price, to place in one's pen in the spring of each year. There are probably a quarter of a million amateur poultry-keepers who by adopting this suggestion may convert a loss into a certain gain, as well as avoid the many diseases which sooner or later bring disaster to all poultry-keepers who attempt to do too much upon a limited space. *K. B. Baghot de la Bere, Burbage Hall, Leicestershire.*

TREES AND SHRUBS.

THE GOLDEN ELDER.

THERE is a general impression that the Golden Elder is a variety of our common native Elder (*Sambucus nigra*), and in the recently-issued revised edition of the *Hand-List of Trees and Shrubs grown in the Kew Arboretum*, it is so designated. This, however, is an error. The species to which this plant belongs is the Canadian Elder (*S. canadensis*), a plant which flowers later in the season than the common Elder, and whose flowers have not the powerful odour of those of that species. The cymes of the Canadian Elder are more cushion-shaped than those of the common Elder, and its leaves have, under similar conditions, one pair more of lateral leaflets. It also differs from the common Elder in the number of the parts of its calyx, corolla, and andræcium. In *S. nigra* the number of sepals, petals, and stamens is four, but occasionally five occur. In *S. canadensis* the number of these is five, but six are occasionally met with.

At a meeting of the Botanical Society of Edinburgh, on July 9, 1896, I pointed out that this plant was a variety of *S. canadensis*, and in a letter to the *Garden* on March 5, 1898, in reference to an article which appeared in that periodical on the Elders, I repeated this observation. Subsequent to the meeting of the Botanical Society at which I made this communication, I had an opportunity of discussing the matter with Mr. James Grieve, of Redbraes Nursery, Edinburgh, whom I found to be quite cognisant of the fact that this plant was a variety of the Canadian species, and I also learned from him some interesting facts relating to its history; and quite recently I had an opportunity of again discussing the matter with him. Mr. Grieve states that the Golden Elder was first brought to Edinburgh (where it subsequently became very plentiful in the public gardens) about thirty years ago, from the nurseries of Messrs. W. Samson & Co., Kilmarnock, and that the late Mr. William Gorrie, landscape gardener, Edinburgh, who called it the "Cauliflower-

headed" Elder, was chiefly instrumental in bringing it under the notice of the Edinburgh nursery trade. But at that time the plant must have been very scarce, as Mr. Grieve states that he himself propagated it from single buds (as is done in the case of Vines) in the nurseries of Messrs. Dicksons & Co., at Pilrig. It would be interesting to find out if anything more than has been stated here is known to readers of the *Gardeners' Chronicle* as to the origin and distribution of this now very common plant, as I have, so far, been unable to find any record of this in published works. *A. D. Richardson, Edinburgh.*

HARDY PLANT NOTES.

KNIPHOPIA ERECTA (?).

IN the autumn of last year I received from a well-known French nurseryman at Lyons a plant under the above name which purported to be something quite new and distinct from all other members of the genus in having its flower-tubes turned upwards, instead of downwards, as they usually are. When my plant came into flower with two spikes of bloom about a fortnight ago I was much disappointed to find that its flowers were in nowise erect, but merely those of an ordinary form of *K. uvaria*. I at once wrote to the sender of the plant, requesting him to send me a spike of the true variety for comparison, in case a wrong plant had been sent me by mistake. I now hear from him to say that to his great surprise and regret the flowers of his plants, which were perfectly erect last year, are this year no longer so, but seem to have reverted to the type form. I think this curious case of reversion is worth recording in your columns. *W. E. Gumbleton.*

PAPAVER ACULEATUM (the Prickly-stemmed Poppy).

IN the spring of this year some seeds were sent to me for trial by Messrs. Barr Brothers, which had been collected by their father when travelling in the Transvaal region. Amongst these was one labelled "Bronze Poppy"; this is now flowering in my garden, and is most distinct in appearance, all the leaves and flower-stems being thickly covered with stout hairs or bristles, which account for its distinctive name as above stated. I sent a blooming stem to the Kew herbarium for identification, when it was pronounced to be *Papaver aculeatum*.

I find that it is also figured in the 64th volume of the *Botanical Magazine*, on plate 3,623, under the synonym of *P. gariëpinum*; but this plate somewhat inadequately represents the plant, and hardly does full justice to either the size or colour of its flowers. It is also figured by Sweet in the second volume of his *British Flower Garden*, on plate 173, under the name of *P. horridum*; and this is a much better and more accurate portrait of the flower. *W. E. Gumbleton.*

NOTICES OF BOOKS.

A CONCISE HANDBOOK OF GARDEN FLOWERS, by H. M. Batson. (Methuen & Co.)

NOW that so-called wild-gardens, rock-gardens, and herbaceous borders are in vogue, the utility of a "concise handbook" will not be contested, provided it be well done. Of course there are Nicholson's *Dictionary of Gardening*, Robinson's *English Flower Garden*, the *Kew Hand-Lists*, which are specially valuable as the work of experts, and various other books that might be enumerated in this connection, but they cannot all be called concise handbooks. Mr. Batson's work is a handbook in the literal sense of the term, and of necessity it is concise. Little or no botanical detail is given, the special points in the manners

and customs of the plants, the way in which they adapt themselves to varying conditions are not mentioned, and so a world of interest is left untouched. But no blame can be imputed to the compiler on this ground. It did not enter into his plan to go into such details, and had he done so conciseness must have been abandoned. What he has given us is an alphabetically arranged catalogue of most of the more important hardy herbaceous plants. This list is carefully compiled and up to date. *Fritillaria askabadensis*, for instance, is included, and so is *Astilbe Davidii*. With reference to this latter plant, the writer has gone out of his way to give it an absurd English name, "David's False Goat's-Beard"! whilst the singular beauty of the flower is hardly, if at all, mentioned.

Begonia clivorum, a noble perennial, is also included, as well as *Polygonum Baldschuanicum*. *Polygonum sacalinense* is alluded to under the heading of *P. cuspidatum*, though it is very properly pointed out that it is distinct from *cuspidatum*. Reference to the full index, which is given at the end of the volume, will prevent a careless reader from confounding the two.

A similar remark applies to *Hypericum Moserianum*, which surely deserved a separate paragraph, instead of a mere mention under *H. calycinum*.

Begonia Veitchii can hardly be considered a hardy plant in this country.

The cultural details are brief but to the point. They reflect the author's own experience, and may not always coincide with the experience of others. We should not, for instance, recommend anyone to plant *Hieracium aurantiacum* on the rock-work, or anywhere where its vagrant habits and powerful assertiveness would be objectionable.

The Shirley Poppy and other forms of *Papaver Rhæas* are omitted, but no fewer than four species of *Incarvillea* are noted. One *Rubus* only is included, *R. arcticus*—spelt, by the way, "R-articus," a trifling oversight which we mention because it forms an almost solitary exception to the correctness of the names. *Rubus deliciosus* and *R. leucostachys*, and the double pink Bramble had claims for admission, but we can well understand that selection and elimination had to be practised.

Discursive notes of this kind might be largely extended, but to little purpose. Let us in conclusion recommend the book as a very useful, carefully compiled catalogue, and one likely to be very serviceable to the amateur and to young gardeners.

ORCHIDS.*

IT would require far more space than we can afford to do justice to this excellent work, which in its original form by Mr. W. Watson, of Kew, assisted by Mr. W. J. Bean, is well known and highly appreciated by orchidists generally. The revision of the work, and the addition of more extensive cultural instructions, together with a mine of information relating to all that pertains to the raising and cultivation of hybrid Orchids, by Mr. H. J. Chapman, has greatly enhanced its value in every respect. There seems no part of the practice of Orchid culture which has not been ably dealt with in a short chapter easily turned to by reference to the index; and the twenty fine coloured plates and numerous illustrations, chiefly from photographs by Mr. Chapman, are not only a help to the Orchid-grower seeking information, but a temptation to the casual reader who does not grow Orchids to attempt, with the aid of such an excellent work, the pleasures of Orchid culture.

As has been stated, the work commences with chapters on the leading points in Orchid-culture.

* *Orchids, their Culture and Management.* L. Upcott Gill, Drury Lane, London.

that they will never recover; a few kinds are bearing half a crop, early kinds none at all. *G. Wythes, Syon House Gardens, Brentford.*

This is one of the worst seasons for fruit that I have experienced for many years—Apples and Pears almost absent, Plums short, and Cherries only a thin crop; but of the soft fruit there has been a very fair crop—Strawberries good, Raspberries excellent, and of Gooseberries and Red Currants we have had a very satisfactory crop of nice fruit. *H. Markham, Wrotham Park Gardens, Barnet.*

The worst season I have ever had to record. The frosts wrecked the Pears completely after they had been hastened by the previous mild weather. The earliest Apple-blossom was cut off too, and so was the earliest Strawberry the same. Attacks of both aphid (green and black) and of American blight are more severe and persistent than usual. *Jas. Hudson, Gunnersbury House Gardens, Acton.*

Never was there a finer prospect of a good fruit crop than there was this spring; but the cold winds and frost we experienced in April ruined the blossom and embryo fruits. From April 13 to 25 we had cold north-east winds, with from 4° to 9° of frost every morning. The only fruits that withstood the cold were Gooseberries and Currants; early Strawberries showing flower were all spoiled, but on the later varieties there was a fair crop. What few fruits of Apples, Pears, Plums, and Peaches did escape were completely destroyed by a terrific thunder-storm of hail and rain we had on May 26; the hail was more like pieces of ice than anything else, breaking off or lacerating every tender leaf and fruit. Peaches and Apricots on the walls had pieces knocked out of them to the core. Not a fruit of anything escaped that was exposed, the trees being mulched with their foliage. Potatoes, fair crops on light soils, on the heavy lands very poor owing to the late heavy rains leaving the ground so hard. No disease thus far. *W. Watson, Harefield Place Gardens, Uxbridge.*

I regret to say the fruit crops are nearly a failure in this district. Gooseberries alone were satisfactory. Strawberries half crop. Pears and Plums total failure through the late frosts. Apples will be about a third of a crop, many having fallen. *W. Bates, Cross Deep Gardens, Twickenham.*

SURREY.—Fruit crops in this district are extremely scanty. With the exception of Apples and Morello Cherries there is nothing. Pears and Plums are very scarce. American blight is rampant, and in many cases the trees are growing much too strong, and the growths, with so much wet and sunless weather, are very soft. Strawberries, Gooseberries, Raspberries, and Currants have been a fair crop, but the quality of the fruit has left much to be desired. *J. F. McLeod, Dover House Gardens, Roehampton.*

We have absolutely no Plums and no Pears; a good crop set, but the severe late frosts took all the young fruit. Apples just escaped. Strawberries seemed to throw up a second bloom and so gave a moderate but late crop. *W. Wilks, Shirley Vicarage, Croydon.*

A complete failure in the case of Apples, Pears, and Plums, the late frosts we experienced being alone responsible. Strawberries, in spite of losing their first flowers, have been a good crop in quantity and quality; Royal Sovereign and Trafalgar particularly so. Raspberries in many cases have been few and are blighted. Gooseberries and Red Currants have been good, but Black Currants poor. *W. Honess, Cobham Park Gardens.*

The Pear crop is practically a failure. Apple-trees flowered well, but the frost destroyed the greater part. Some trees of a variety are

cropping well, and others of the same have no fruits, though they seem to be in the same condition at time of flowering and are close together. Among Apples that are best with us is Stone's, a variety that has not failed for twelve years. It is undoubtedly one of the best varieties for autumn use. Lane's Prince Albert is another nearly certain cropper; Hormead Pearmain, Tower of Glamis, Warner's King, Allen's Everlasting, and Stirling Castle. Dessert Apples are very few. *C. J. Salter, Woodlatch Lodge Gardens, Reigate.*

The condition of the fruit crops this year is deplorable, rarely has a worse report had to be made. Apples are a very light crop, a fair lot on one tree in twenty perhaps, but generally very thin. Whilst there are rather better results on walls, both Pears and Plums out in the open show scarcely a fruit. Cherries are better, yet the crop is a light one. On walls we see of stone fruits about half a crop. Of bush fruits, Gooseberries have been fairly plentiful, but Currants, except on walls, have been very poor. Strawberries have been partial, in some places good, in others thin, so much of the first bloom was destroyed by frost. Raspberries have been fairly plentiful, but all the same, many shoots suffered from frosts in the spring. *A. Dean, Kingston-on-Thames.*

With the exception of small fruits, all other kinds are the worst and poorest I have seen here during the past seventeen years. *W. C. Leach, Albury Park Gardens, Guildford.*

SUSSEX.—The only Apple-trees that are carrying a full crop are two large old standards of Hambledon Deux-Ans, which are somewhat sheltered from north and north-east winds. The foliage at present is tolerably healthy, and we have so far escaped the disastrous storms which have caused much damage near us. *E. Burbury, Arundel Castle Gardens.*

The Apple-crop in this district is a complete failure, but I attribute this to the ravages of birds in late spring as much as to the unfavourable season. The only varieties that are carrying anything like a crop are Cellini Pippin, Lord Derby, and King of the Pippins. Among the few varieties of Pears spared by the frosts to carry a crop may be mentioned Pitmaston Duchess, Bergamot d'Esperen, Bœurré Rance, and Jersey Gratioli. Trees of Marie Louise, which have never failed to crop for the last ten years, have none. The severe cold was sufficient to cause the dropping of the profuse bloom upon Plum-trees. Raspberries were a bountiful crop, especially that grand variety Superlative. *Chas. Jones, Ote Hall Gardens, Burgess Hill.*

(To be continued.)

The Week's Work.

THE FLOWER GARDEN.

By *J. C. TALLACE*, Gardener to *E. MILLER MUNDY, Esq.*, Shipley Hall, Derby.

Pyrethrums.—Old clumps of these, after being established for a few years, become very congested in growth, and flower but poorly. In such cases it will be well now to take off sufficient of the best crowns to form another plot, and pot them up singly in small pots. Put them in a cold frame, and keep the atmosphere rather close until they have made new roots and growth. In November the plants may be planted-out with safety where they will flower.

Delphiniums.—Split up and replant Delphiniums. If this be done now, they will make fine plants for blooming next year. Often, for convenience sake, this work is delayed till late in the year, but late-planted divisions winter badly on some soils, and if the work cannot be done now it had better be deferred until spring.

Thrift and Pinks.—These plants when used for edgings in gardens become gappy after a few years. Where this is the case, lift the plants, divide them, and replant the best pieces. Plant

rather deeply, and make the soil firm around the plants. If the Thrift has not previously succeeded owing to the nature of the soil, add to it a good sprinkling of sand or grit.

Fibrous-rooted Begonias, which are so much used for bedding, can be readily increased by cuttings inserted now in pots or boxes of very sandy soil placed in a warm pit or frame. The joint immediately above the base of each cutting should show a growth bud, and this latter should not be removed before insertion. Tuberos Begonias are not often raised from cuttings, but any special variety may be increased in this way by following the same rule with regard to a base bud and striking the cuttings in a frame with a shaded aspect.

Mesembryanthemum cordifolium variegatum.—This favourite carpet plant must be rooted in an open airy position on a shelf in the glasshouse. If the cuttings be kept in a close, moist, or shaded place they will damp off.

General Work.—Keep the growth of weeds under by frequently using the hoe. On herbaceous borders and flower-beds regulate the ties and supports afforded the plants. Pick off all dead flowers and leaves, and ensure tidiness in all ways. Seeds of most hardy annuals may still be sown for flowering early next summer. Those sown earlier will be in need of thinning. Roses that have been budded and on which the ties have not yet been loosened, or which have been re-tied, should be examined to see that the ligatures do not cut into the bark.

THE KITCHEN GARDEN.

By *JOHN FLEMING*, Gardener to *Sir C. PIGOTT, Bart.*, Wexham Park, Slough.

Cauliflowers.—Make a sowing now, and another about September 20. Sow the seeds thinly on a south border or other sheltered position in drills drawn at 9 or 12 inches apart and securely netted against birds. As soon as the seedlings are large enough, prick them out into cold frames in soil that is not too rich. Shade them from strong sunshine and keep the frames closed for a few days only. Three good varieties for this sowing are Sutton's Magnum Bonum, Walcheren, and Veitch's Autumn Giant. Here we depend on plants sown in heat in January. Sutton's First Crop, if sown at that date, will produce nice heads by the end of May or the beginning of June and are not so liable to buttoning or bolting as those sown in autumn.

Turnips.—The last sowing may now be made for autumn and winter use. Such late-raised plants will sometimes grow during the whole winter, and they are valuable for supplying green-tops in early spring. Afford the soil a good dressing of wood-ashes and soot, and sow the seeds in shallow drills. Thin out earlier sowings and dust the plants with soot, wood-ashes, and lime. Use the hoe frequently.

Spinach.—Make another sowing on deeply-dug and well-manured land in a somewhat sheltered but open position. Afford the ground a good surface dressing of burnt garden refuse, level and make the soil moderately firm. When the seeds have been lightly covered in, throw over the bed a coating of fresh wood ashes. Thin out earlier plants as soon as ready to a distance of 3 or 4 inches. Afford dustings of soot and lime when the leaves are wet.

Spring-sown Onions.—Carefully bend over the tops, laying them all one way to hasten the ripening process. About a week afterwards they should be pulled up and turned over every two or three days that they may ripen off as quickly as possible. The harvesting of this crop requires much care. The keeping qualities of Onions depend largely on the degree in which they are matured and the care taken in handling them. Store the bulbs on a fine day, and lay them thinly where the air can ply about them freely, or they may be roped and hung up in any dry airy place. Make another sowing of winter Onions as advised in previous notes.

Potatoes. Owing to frequent rains and the absence of sun, the disease is appearing amongst late varieties, and the longer the tubers remain in the wet ground the worse they will become. Varieties that have finished their growth should be denuded of the haulm at once, and lifted as

soon as the work can be done in dry weather. Burn the haulm as soon as it is removed. Do not heap the tubers together thickly, but place them where they can be sorted over occasionally that infested tubers may be removed. Medium-sized tubers for planting next season should be placed thinly on shelves in any cool, airy place.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Preparing for the Planting Season.—Ground which it is intended to plant with fruit-trees in November, if cleared of summer crops, should be trenched forthwith. Bastard trenching is the best preparation for the soil, as by this method the best or top spit of soil is still kept at the top for the roots of the trees to start away in. If the soil is of a heavy nature, a liberal dressing of farmyard-manure, wood-ashes, and road-scrappings should be dug into the bottom spit as the work proceeds; and if stone fruits are to be grown, lime-rubble, at the rate of one bushel to the rood, should be added. Light or medium soils will not require wood-ashes, but may be much benefited if a dressing of slightly heavier soil be afforded. On no account should heavy clay be dug in, as it will not mix with the lighter soil.

General Work.—As the fruit is cleared from the bush-trained trees, take a digging-fork and point over the surface of the ground that is caked hard from much trampling by the feet. This will destroy the surface-rooting weeds, and allow the sun and air to penetrate the soil. Remove the mulching material from around all fruit-trees, unless they are carrying a heavy crop, in order that the sun-heat may the better assist in maturing the wood. Take advantage of wet days to get the fruit-room put in order, though I am afraid well-filled fruit-rooms will be very rare this season. Scrub the shelves with soft-soap and hot-water, and do any lime-washing that may be required.

Strawberries.—The soil being in excellent condition Strawberries should be planted out at once. Plant them firmly; and should dry weather set in afford them a slight mulch with litter.

FRUITS UNDER GLASS.

By T. H. C.

The Pine Stove.—The house containing plants carrying ripe or ripening fruit should be afforded a night temperature of 70° to 75°. Admit a little air in the morning when the temperature has commenced to rise, and close early in the afternoon, when with sun-heat the temperature may rise to 90° or 95°. A dry atmosphere is conducive to good flavour in the fruit, and it is essential to perfect ripening. Water with clear water only, but keep the soil on the dry side as the fruit approaches maturity.

Succession Houses.—From the time plants pass out of flower until the fruits commence to change colour, they may be afforded stimulants at each watering. Liquid manure obtained from the soakings of deer or sheep's manure, and for a change guano water, will be found excellent fertilisers, and should be applied in a tepid state. Winter-fruiting smooth Cayennes that were started last month will now be in flower, a dryer condition of the atmosphere therefore should be maintained; but do not allow the roots to lack moisture. The bottom heat may range from 85° to 90°, the night temperature from 65° to 70°, and by day 10° to 15° more, making the most of the amount of solar warmth there may be. Aim at securing a sturdy growth in young plants recently put into their fruiting pots, by giving them timely and ample ventilation upon every favourable occasion. At closing time slightly dew them overhead with the syringe, and in fine weather damp the paths frequently. The present is a good time to put in a batch of Queen suckers. Before potting them, make sure they are free of scale or other insect pests. Pot firmly in 5 or 6 in. pots in a rich, loamy compost. Plunge the pots in a bottom heat of 85° to 90° close to the roof glass. Afford shade during bright weather, and lightly syringe the plants in the morning and afternoon, also the walls and other surfaces of the propagating pit. The night temperature need not exceed 65°, but may rise by day

to 85°, with ventilation and plenty of moisture in the atmosphere.

Figs.—Trees in pots for producing the earliest forced figs next year should now have their growths in a well-ripened condition, and, provided they have been well hardened off under glass, they may be stood out-of-doors in a sheltered but sunny position. Keep the foliage free from insect pests, and give sufficient water to maintain the leaves in a fresh condition, but lay the pots on their sides during wet weather. Thin out the growths if they are in any way crowded, this being all the pruning necessary where systematic pinching has been carried out. Do not permit later trees in pots to carry more fruit in the second crop than they can bring to a serviceable size, as it is necessary that the trees should make good wood for the production of next year's first crop. When the roots need water, especially if the trees are old or bear heavy crops, afford them diluted liquid manure. Houses containing ripening fruit should be afforded a constant circulation of dry warm air, but do not let the roots suffer from dryness at this time.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bioton, Budleigh Salterton, Devonshire.

Vallotas.—The flower-spikes are now developing, therefore afford the plants manure-water once or twice a week. They require all the sunlight possible, and are stood out-of-doors from July until the flowers open, in many gardens in this county, with satisfactory results.

Begonias.—Support leading growths of Gloire de Lorraine with neat stakes of green Bamboo or deal painted that colour. When the pots are full of roots afford the plants a little weak manure-water once each week. A weak solution of clear soot-water will keep the foliage a good colour. The plants being of more value after the middle of October, all flowers should be picked off during September, and the plants lightly syringed twice a day, to ward off thrips and mites. *B. Dregei*, a pure white species, makes a good companion for Gloire de Lorraine, and *B. x President Carnot*, a strong grower with rosy carmine flowers, is useful in early autumn. The variety Gloire de Sceaux may be shifted into 5 or 6-inch pots. These will flower after the turn of the year.

Cyclamen.—Within the next few weeks a sowing should be made of these useful winter-flowering plants. Sow in shallow pans, after carefully draining them. Place a thin layer of half-decayed leaves over the drainage material, then fill the pans to within an inch of the rim, with equal parts of sifted loam and leaf-soil, and silver sand. Make this moderately firm, and if it is too dry, apply water a few hours before sowing the seeds. Dibble the seeds in at distances of $\frac{1}{2}$ inch apart, and cover them $\frac{1}{2}$ inch deep. Place sheets of glass over the pans and shade them from the sun's rays. Afford a temperature of 60°, and in four to six weeks, when the seedlings have appeared, remove the pans to within a foot of the glass roof and keep the soil fairly moist. Plants standing in cold pits or frames and having their pots full of roots, may be fed once or twice weekly, pulling out from their base all flowers that push above the foliage next month. Pull the frame lights back during the night for the next few weeks if the weather should turn fine, but not if there are frequent rains.

Violets, for planting in pits or frames should have all runners cut off as they appear. The summer has been favourable to the plants, the frequent showers having kept them free from red spider. Plant them in their winter quarters early in the month of October.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury.

Miltonia vexillaria, having had a short rest, has commenced to make new growth. The plants may now be repotted or top dressed according to their need. Carefully examine the plants before the work is commenced, and be sure each is quite free from insect pests. Small yellow thrips conceal themselves down in the interior of the young

growths, when it is almost impossible to eradicate them with brush or sponge. Plants so attacked should be fumigated at regular intervals, and occasionally dipped in some safe insecticide. It is not necessary to fumigate the whole house for the sake of a few plants; let those infested be carried to another house it is intended to fumigate. Before repotting a plant, take it out of the receptacle and shake the old potting material from the roots, removing all dead and decaying matter. Large plants that are unsatisfactory in the centre should be divided, and each piece potted singly, it being most difficult to keep them healthy in large masses for any length of time. The potting compost should be similar to that described in the Calendar for January 31st. Plants potted at this season should be placed in as small pots as possible, from which they can be shifted again in the spring. Afford water sparingly to plants that have been repotted; let it be applied through a can having a fine "rose." Stand the plants in a shady position in the Cattleya or intermediate house.

Sophranitis grandiflora, having started into growth, may be examined, and each plant treated according to its requirements. The species thrives well under similar conditions to those advised in a recent Calendar for the short-bulbed Odontoglossums, except that the *Sophranitis* should be suspended in the warmest part of the house. Never disturb the roots of *Sophranitis* unless it is really necessary, but top-dress the plants if the surface-material has become sour.

Cattleya citrina is totally unlike any other Cattleya in its habit of growth, the pseudo-bulbs, foliage, and its lovely sweet-scented flowers, always droop towards the ground. The plants should be grown on blocks of wood or teak-wood rafts, with a little sphagnum-moss pricked in about the roots to help hold the moisture. Suspend the plants close up to the roof-glass in the cool intermediate-house. After a good rest which followed the flowering period, root action and growth have again commenced; therefore a more liberal supply of water will be needed, and the block and plant should be frequently immersed in the water-tank.

THE APIARY.

By EXPERT.

Work in the Apiary.—The beautiful weather we are having [written several days since. Ed.] is extending the honey season, and honey is still coming in from the second crops of Sainfoin and White Clover, to say nothing of large quantities of Charlock and wild flowers. Sections should still be given where necessary, but the district should be taken into consideration; for instance, where there is plenty of Sainfoin, White Clover, &c., as mentioned above, full crates of sections can still be given. When the sections are placed in the crates they should be wedged close up together to prevent the bees building such bulky sections, as you cannot get more in price for them; and in packing they are most awkward. The dividers should be scraped, whether they are tin, glass, or wood, as any small pieces of comb attached to them will induce the bees to build the sections on to them; this spoils the section for sale, to say nothing of the inconvenience. In other districts, where the honey-flow is not so good, about twelve or fifteen sections should be placed on, and the half-full ones from the back should be placed in the front, to give the bees a better chance of filling them. Shallow frames should be extracted and closed up in the same way; the frames should all be returned to the hive, to allow the bees to clear them out dry, and the ones that are left closed up. In extracting, keep as far away from your apiary as possible, and close the doors to prevent the bees coming in. No honey should be exposed longer than is necessary. In taking off sections, as soon as you have enough to carry they should be taken away at once, taking care that the sections are placed the same way up as when taken from the hive. Destroy earwigs and wax-moth as soon as discovered. Replenish the water supply. Mark off your stocks which have given no surplus, and keep a look-out for driven bees for strengthening a little later.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **Publisher**. Letters for Publication, as well as specimens and plants for naming, should be addressed to the **EDITOR**, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR SEPTEMBER.

- TUESDAY, SEPT. 1 { Royal Horticultural Society's Committee Meet. Lecture on "Judging Cactus Dahlias." National Dahlia Society's Exhibition at the Drill Hall (two days).
- THURSDAY, SEPT. 3 { Alnwick Horticultural and Botanical Society's Show. Paisley Horticultural Society's Show (two days).
- SATURDAY, SEPT. 5 { Société Française d'Horticulture de Londres Meet. Royal Caledonian Horticultural Society's Show in Waverley Market, Edinburgh (two days). York Dahlia Show.
- WEDNESDAY, SEPT. 9 {
- SATURDAY, SEPT. 12—Royal Botanic Society Meet.
- TUESDAY, SEPT. 15 { Royal Horticultural Society's Committee Meet. Lecture on "Edible Fungi." National Dahlia Society's Floral Committee Meeting at Drill Hall.
- FRIDAY, SEPT. 18 { Horticultural Show at Gothenburg, Sweden (five days).
- MONDAY, SEPT. 21 { National Chrysanthemum Society's First Floral Committee Meeting
- WEDNESDAY, SEPT. 23—Royal Botanic Society Meet.
- THURSDAY, SEPT. 24 { Irish Gardeners' Association Meeting. Royal Horticultural Society's Fruit and Vegetable Show and Conference in the Chiswick Gardens (three days). Gardeners' Dinner at Holborn Restaurant, 7 P.M.
- TUESDAY, SEPT. 29 {

SALES FOR THE WEEK.

- MONDAY TO FRIDAY, AUG. 31 to SEPT. 4—Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10.30 o'clock.
 - THURSDAY NEXT—Consignment of Liliun Harrisii at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 3 o'clock.
 - FRIDAY NEXT—Orchids in variety, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.
- (For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—61.2°.

ACTUAL TEMPERATURES:
LONDON.—August 26 (6 P.M.): Max. 67°; Min. 50°. August 27.—Fine, warm.

Fruit Culture in Ireland. THE Irish Land Purchase Bill has been passed by the Legislature, and great expectations have been excited as to the scope of the measure and its results. This being a non-political journal, we can only venture to hope that at last the great Irish Land question may have been settled in such a way as to produce lasting benefits to the community; for these benefits must be felt over the kingdom; and one of these will probably be exemplified by a vast increase in the acreage of land set apart for fruit cultivation.

The fruit nowadays produced in the sister Island is certainly of a very high class, equal to any ever shown at the Crystal Palace. Confirmation of this was given at the great Fruit section of the International Exhibition held in Cork in October of last year. Of the six hundred and twenty-four exhibits by amateurs, gardeners, and growers, divided into sixty-six competitive classes, there was none that did not receive commendation, especially, perhaps, the groups twelve feet by four feet. The show was principally the work of the Irish Department of Agriculture and its indefatigable secretary, Mr. T. P. GILL; and he, together with all who have interested themselves in the subject of Irish fruit culture, are of opinion that no limit can be set to the extension of the culture, save that of the silver sea bordering the cultivated land. We believe it to be nearly capable of demonstration that wherever there is fixity of tenure in agricultural land, there fruit is grown—not always and necessarily for market, but to afford a change of dietary, a sort of relief to porridge and Potatoes; and with the addition to the menu the taste is at once elevated and becomes more refined. The consumer becomes less gross in his appetite—in short, all round a better man. We hope to see thousands of little farms, with their accompanying fruit quarters, and their added industries.

We have noted Mr. GILL's work in a very recent communication to a correspondent of ours. That gentleman says, "In a number of counties itinerant instructors are at work stimulating an interest in this industry (Fruit culture). A co-operative jam factory has recently been started through private enterprise at Navan, while the Government is undertaking an experiment on commercial lines in fruit-growing and preserving at Portadown.

Incidentally we may express the hope that vast areas now unprofitable, or nearly so, will be gradually afforested; but that, owing to the length of time that must elapse before it is remunerative, is a work to be undertaken by the State rather than by individuals.

In conclusion it should be noted that extension of industry ensures a stay of emigration to other lands, and so it may well be claimed that there would soon follow a rise in the population, in the amount in the savings-banks to the credit of the workers, also, not least, a great increase in the happiness of all classes. So Godspeed to the Irish Land Purchase Bill!

The Manuring of Market Garden Crops. WE commend to all concerned the reprint from the *Journal of the Royal Horticultural Society* of a paper on this subject by Dr. BERNARD DYER and Mr. SHRIVEL. It gives a summary of the results of eight years' experiments on various garden and fruit crops. One main object of the experiments was to ascertain whether the present use of very large quantities of dung in market gardening was warranted by results—that is to say, whether the proportion between the cost of production and the financial yield was as satisfactory as it should be.

Heavy dressings of dung at an average cost, say, of eight shillings the ton, are pre-

sumably wasteful, and better financial results would be obtained by using a smaller quantity of dung, supplemented by some suitable fertiliser. The general results of the extensive and varied experiments made during nine or ten years, and recorded in the pamphlet before us, go to show that the purchase of stable-dung in such large quantities is wasteful and extravagant. Farm-yard-manure is, of course, different. But, in any case, the use of dung can to a large extent be profitably supplemented by the admixture of certain chemical fertilisers. The chief value of the stable-dung is to improve the texture and condition of the soil. We have not space to notice in detail the record of the various experiments. We can only say that, with the exception of cereals, they relate to all the ordinary crops of the farm, the kitchen garden, and of the orchard.

The paper is full of information upon points of detail of the greatest moment to the farmer and gardener. To give one illustration only:—The dressing recommended for Strawberries is twenty-five loads of stable-dung (twelve and a half tons) per acre, with a dressing of phosphates and an early application of two hundredweight of nitrate of soda. The early period at which this crop can be marketed is a matter of much greater importance financially than the absolute weight of the crop. The dressing above recommended yields, on the average, not only the best crop, but the earliest. The figures given in regard to "President" Strawberry are very striking. We hope the reprint, which is issued by VINTON & Co., will have a very large circulation among gardeners and farmers.

We are so often asked to cite the quantities of fertilisers to be used on smaller areas than an acre that we reproduce the following calculations of weights of fertilisers for small plots:—

Our manurial applications are, for the sake of uniformity of comparison, calculated in quantities per acre. For readers who may wish to manure smaller areas than this, it may be convenient to give at once a short table enabling them to see at a glance what are the corresponding quantities for smaller areas of ground. We have therefore calculated the various dressings from 1 cwt. up to 8 cwt. per acre into their equivalent quantities for—

1 rood ($\frac{1}{4}$ of an acre).
 1 square rod or perch ($\frac{1}{160}$ of a rood or $\frac{1}{160}$ of an acre).
 1 square yard ($\frac{1}{1540}$ of an acre).

The calculation of dressings per yard is only approximate, but it will be found convenient for the use of readers who wish to make experimental trials on a small scale, or to manure even a few yards of domestic kitchen garden.

The various equivalent dressings are as follows:—

Quantity per acre	Equivalent quantity per		
	Rood	Square rod or perch	Square yd.
cwt.	lbs.	lbs.	oz.
1	28	$\frac{1}{4}$	$\frac{1}{2}$
2	56	$1\frac{1}{2}$	$\frac{1}{1}$
4	112	$2\frac{1}{2}$	$1\frac{1}{2}$
6	168	$4\frac{1}{4}$	$2\frac{1}{4}$
8	224	$5\frac{1}{2}$	3

THE ROYAL HORTICULTURAL SOCIETY will hold a special exhibition of Dahlias on September 1 and 2, in conjunction with the National Dahlia Society, in the Drill Hall, Buckingham Gate, Westminster. At this meeting (unless by special arrangement and permission) only Dahlias can be shown, with the exception of flowers, fruits, &c., for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 6 P.M. on the second day. A lecture on "Judging Cactus Dahlias" will be given, on September 1, by Mr. C. G. WYATT at 3 o'clock.

At a general meeting of the Society held on Tuesday, August 18, twenty-five new Fellows were elected, among them being the Right Hon. Sir FRANCIS H. JEUNE, G.C.B., Col. T. H. SKINNER, and Dr. A. HENRY, making a total of 1,095 elected since the beginning of the present year.

Intending exhibitors at the Fruit and Vegetable Show to be held at Chiswick on September 29, 30, and October 1, can obtain an official entry form, together with schedule of prizes, on application to the Secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W. Entries for this show close on September 22. There will be a special tent for horticultural sundries. A cold luncheon will be provided on September 29, at which the Council, Judges, and the Committees will be present, and for which all interested in the show can obtain tickets (3s., including wine or beer) on application to the Secretary, 117, Victoria Street, S.W., before September 27.

May I ask you to say that the Council have consented to have a Sundries Tent at Chiswick, on September 29, 30, and October 1, in precisely the same way as they did at the last Holland House Show. Applications for space should be made to Mr. WRIGHT, Royal Horticultural Society's Garden, Chiswick, W.

THE GARDENERS' RECEPTION DINNER.—Mr. A. DEAN writes:—"The *Gardeners' Chronicle* has shown so much kind appreciation of the efforts of the Gardeners' Dinner Committee to make the coming dinner function a success, that I ask your kind consent to allow me through your columns to remind all, of either sex, who may desire to attend the dinner, that the date (Sept. 29) of the dinner and the Chiswick Show is rapidly approaching, and that tickets, of which the number is limited, should be secured early. It may interest many to learn that our grand old gardener, DEAN HOLE of Rochester, has secured a ticket and earnestly hopes to be present. We inserted in the circular so widely issued, at the suggestion of our chairman, Mr. OWEN THOMAS, a line referring to the possible fact that the coming show may afford a last opportunity for many to see the old Chiswick gardens. How little did we then think that possibility was so near! In not a few of the letters I receive from old gardeners, not only is that contingency dwelt upon, but there runs through them a vein of strong thankfulness that the Dinner has been organised to enable so many who are veterans in the noble army of gardeners once more to meet and to revive old associations, perhaps, too, for them for the last time. How fortunate are we also in having secured so distinguished a gardener-employer and horticultural patron as Mr. LEOPOLD DE ROHSCHILD for our Chairman, for he will most gladly greet the gardeners of Great Britain! We trust that many gentlemen who know and appreciate gardeners and their worth will attend and support him. It will be an occasion long to be remembered, and who would be willingly absent? We trust to see many of our sisters as well as brothers in horticulture present. All communications should come to me at 62, Richmond Road, Kingston-on-Thames." A. Dean.

R. W. ADLAM.—We greatly regret to have to announce the death, on July 17, from malignant disease, of our Transvaal correspondent. During the war he took refuge at Port Elizabeth, but returned to Johannesburg before the guerilla war was quite stamped out. His account of the vegetation and of the country generally at that time is very interesting, and may be read in our columns, October 5, 1901. Here, too, he mentions how the trees in the Joubert Park had grown during his absence. His herbarium and library, including the *Gardeners' Chronicle*, were safe, for, as he said, "Your Boer loves to commandeer gold, but he has a rooted aversion for what makes gold, i.e., knowledge." The plants in the conservatories were not in such good condition, as they had been left in charge of a coolie who did not know a Palm from a Primula. The Orchids were in a miserable condition, and many valuable plants had vanished utterly. In spite of all this Mr. ADLAM wrote hopefully of the future, and, as we know, devoted himself energetically to the care and improvement of the Joubert Park, and to efforts to promote forestry and fruit-growing in the Transvaal. The Peach is mentioned as specially suitable for cultivation in that district. Those interested in knowing what other fruits will do in that country should read his article on the subject in our columns, April 5, 1902. Mr. ADLAM also contributed from time to time notices of rare or novel plants found by him, and was in communication with Kew, the Cambridge Botanic Garden, and other similar establishments. His death is a serious loss to Botany and Horticulture.

MR. LEWIS CASTLE.—The friends of this gentleman will sympathise with him in the death of his wife on the 22nd inst., in her forty-second year. She had been in ill-health for several years, but her condition became serious within the last two months. She was well known to a former generation of Kewites as the daughter of an old Kewite, Mr. W. GOSSETT, and was much interested in horticultural matters, rendering great assistance to her husband in his early career.

THE SENIOR CAMELLIA.—A recent number of the *Revue Horticole* contains a figure and a description of a Camellia growing in the Royal Park at Pillnitz, near Dresden. It formed one of four originally introduced by Father Camelli. In 1801 the head gardener planted it in the open, in a sheltered situation. It is now more than 100 years old, and is covered every year with a profusion of single red flowers. The bush is 8'50 m. (27 feet) through, and 26 m. (more than 84 feet) in circumference. It is protected in winter by a kind of movable shed, which can be slightly heated when required.

CIDER-APPLES IN FRANCE.—From official information we gather the following respecting the prospects of a cider-apple crop:—In Brest and district there are no Apples; in Morlaix about 75 per cent. less than the usual crop; Quimper, over; Concarneau and Quimperlé, in South Finistere generally, yield the largest crop; In the Quimperlé district it is about 70 per cent. of the average crop; Châteaulin, none; Department of the Côtes du Nord, none; Morbihan-Ploermel district are generally very bad crops; Vannes district not enough for local requirements.

ARISTOLOCHIA SIPHO.—This climber, with its broad cordate ovate leaves, is a capital plant for clothing pergolas and similar purposes, albeit its flowers are the exclusive property of the botanist and make no appeal to the ordinary lover of flowers. Every now and then the plant, for some reasons yet to be determined, changes the character of its foliage, and the big broad leaves are

replaced by long narrow lanceolate or even linear productions. It is a mere guess to say that this is due to unfavourable climatal conditions influencing the plant at a particular stage of its existence, but we have no other solution of the problem to offer, nor has Mr. DIVERS, who kindly sends us illustrative specimens from Belvoir. The plant is somewhat subject to foliar vagaries. We have seen "pitchers" formed on the leaves, and frequently frill-like outgrowths as if it were a Scotch Kail.

CHANNEL ISLANDS.—STATISTICS OF THE POTATO CROP: SEASON 1903.—It will be seen that the prophecies as to the financial result of the crop have been justified by facts, the total value of exports being £475,888 17s. 6d. Only in one year since 1885 has there been a better result, viz., in 1891, when the amount realised was £487,642 1s. 8d. It should be noted that the number of tons exported (47,530) represents the net, and not the gross weight, a difference of 5,470 tons being thus accounted for. The busiest week was that from June 8 to June 13, when 10,025 tons, representing something approaching a quarter of the whole crop, was exported. The highest price obtained was £23 8s. per ton, and the lowest £4 11s. The total number of packages of Potatos reached the surprising total of 1,086,262.

PHILIP BARBER, Notary Public, Steamship Agent, &c., &c.

15, Mulcaster Street, Jersey, August 13, 1903.

APPLE HELP FROM CANADA.—Learning of the deficiency in France, &c., the High Commissioner for Canada has informed our Board of Trade Department that in view of the considerable demand that will probably exist for cooking and for cider Apples, he has made inquiry of the Dominion Department of Agriculture a

Ottawa respecting the supplies available in Canada, to which the following reply was cabled: "Large quantities of cooking and cider Apples obtainable at about fifteen dollars for long box. Hand-picked stock, costing twenty dollars, would carry safer, owing to risk of deterioration in transit."

GARDEN AND FARM PRODUCE BY RAIL.—The carriage of agricultural produce by passenger train on the Great Eastern system appears to be growing in popularity, judging from the figures furnished us by the Traffic Manager. That gentleman informs us that in the first six months of the year the number of parcels carried was no fewer than 90,000, which shows, when compared with the 84,000 carried during the corresponding period last year, an increase of 6,000 parcels.

SWEET PEAS.—We have received specimens of the following meritorious novelties from Messrs. W. W. Johnsen & Son Ltd., Boston.

Gladys Deal.—Robust habit; flowers three in a raceme; pale self lavender coloured; standard flat, scarcely notched.

Eastern Queen.—Clusters three-flowered; flowers self coloured, pale ivory coloured; standard rounded entire; wings large spreading.

Caprice.—Clusters three-flowered; flowers white flushed with pink, especially at the back of the standard.

Elfrida.—Clusters mostly three-flowered; flowers white flaked with rosy-purple, sometimes semi-double; standard rounded entire.

DAHLIAS.—Messrs. CANNELL send us some very handsome flowers of the so-called reflexed

scarlet, very large; *Madame Keller*, deep rosy-lilac, base yellow; *Beauty of Kent*, florets rich maroon with white tips; *Madame Lumière*, white with broad deep-rose stripes in the centre; *Mlle. Hélène Charvet*, very large white; *Germania*, of a beautiful shade of rose-pink, central florets yellow; *Count Stegen*—(we have not space to spell the Dutch name in full, moreover we are afraid to misspell it!), the flower is of a very peculiar shade of orange-brown; *Source de Fer*, deep-scarlet with narrow yellow stripes; *Madame van der Dael*, flowers lilac, inner florets pale yellow or whitish.

HOLLYHOCK.—Sir HERBERT MAXWELL favours us with the following communication:—"Does anyone know the meaning of the word?" you ask

FIG. 59.—CHAMPION GRAPE CLASS AT SHREWSBURY. (SEE P. 151.)

First prize exhibit from the Earl of Harrington, gr., Mr. Goodacre.

APPLE-CROP IN NOVA SCOTIA.—A correspondent writes:—"I have just been informed that the Nova Scotia Apple-crop promises to be more than satisfactory. According to official estimates, based on present indications, there should be a full crop of superior Apples, with a surplus of over 400,000 barrels for export, varieties and qualities being about as follows:—Nonpareil, 60,000 barrels; King, 50,000; Gravenstein, 50,000; Ribston Pippin, 40,000; Golden Russet, 30,000; Baldwin, 60,000; Rhode Island Greening, 30,000; other varieties, 80,000 barrels."

RHUBARB DAW'S CHAMPION.—Our attention has been called to the fact that the variety of Rhubarb illustrated in the *Gardeners' Chronicle* for April 14, 1900, is sometimes spelt incorrectly. The raiser's name, it appears, is "DAWS," not "DAW." We hope that writers will be careful to put the apostrophe after the last letter, and thus respect our correspondent's legitimate susceptibilities.

type, which are becoming popular, particularly for church decoration. Just as the old show Pansies were killed, remarks Mr. CANNELL, by the big Belgian Pansies, so the show Dahlias are being ousted by the newer forms with flat, not incurved, florets. Everyone to his taste. For our part we shall not be sorry to see the end of the "lumpy, inelegant" flowers beloved of a generation of florists that is rapidly disappearing. Even the exquisite gradations of colour do not compensate for the hideousness of the form. Happily in the so-called reflexed type, as seen in the specimens before us, we have flowers that are acceptable both for colour and form. There has also been a tendency for some time past to exhibit these flowers in a less formal and more graceful manner than in the regulation boxes, and we trust this tendency will grow till the last remnant of ugliness disappears. Among the more beautiful forms sent us by Messrs. CANNELL are: *Jeanne Charmet*, lilac; *Souvenir de Gustav Douzón*

in your leader of August 22. Professor SKERT has analysed it pretty closely upon severely scientific principles, and perhaps I may summarise his conclusions for the benefit of those who have not his etymological dictionary at hand. 'Hoc', genitive 'hocces', was the Anglo-Saxon name for the Mallow. In middle English (A.D. 1200—1500) 'holihoc' and 'holihoke' appear in vocabularies as translation of the Latin 'Althea' and the old French 'ymalve.' From the last comes the modern French 'guimauve,' Marsh Mallow. 'Hoc' seems to be a word borrowed from the Celtic, the Welsh for Mallow being 'hocys.' The prefix 'holly' is misleading; it should be spelt with but one 'l,' being simply the adjective 'holy.' In MINSHEN'S *Guide into the Tongues* (1627) occurs 'Holie hocke, i.e., malva sacra' (the Holy Mallow). Although H. WEDGWOOD was not an authority on botany, he is worth quoting on this point. In his *Dictionary of English Etymology* (1872) he observes, 'The Hollyhock was doubtless

so called from being brought from the Holy Land, where it is indigenous.' The first occurrence of the compound name in English certainly corresponds with the period of the Crusades." *Herbert Maxwell.*

DARLINGTON PARK.—We notice in the *Northern Star* an appreciative description of the features of the South Park at Darlington, which is under the direction of Mr. JAMES MORRISON.

BICOLOR CARNATION.—A short time ago we had occasion to note a Carnation with flowers of two distinct colours proceeding from the same stalk. Now Mr. JEFFERIES, of Oxford, sends us a

and other plants grouped to show the forms and their natural means of adaptation to a dry climate. The contrast with the deciduous trees is very striking. Near at hand, in a prominent situation on a raised mound, is a temple, the pillars of which support a domed roof, and of which the capitals are adorned, not with the classical Acanthus, but with the more locally appropriate Stag's-horn Fern (*Platycerium*), which is novel and equally effective. This temple is erected to the memory of the first Governor of Victoria, the Hon. Charles Joseph La Trobe, who in 1846 selected the site for these gardens. The material used for the construction of the temple

venience the *Nertera*, which, in the spring, I was obliged to lift and to replant further away. However, the *Nertera* did not appear to resent the disturbance, and is now covered with its charming little orange-red berries, as it has been during the last two summers. If the weather remains fairly open, many of the berries remain upon the plant until Christmas. Doubtless others grow *Nertera depressa* in the open, but I have myself failed to meet with it in gardens up to the present. All the plants on the ledge are growing in pure peat mixed with a fair amount of granite sand. *S. W. Fitzherbert, South Devon.*

ERYNGIUM AMETHYSTINUM.—I notice that in the article on "Seaside Gardening," p. 109, the

FIG. 60.—CHAMPION GRAPE CLASS AT SHREWSBURY. (SEE P. 151.)

Second prize exhibit from Messrs. D. and W. Buchanan, Kippen, N.B.

specimen in which the two halves of the same flower are different. The petals on one half are white with a pink picotee-edge, those on the other half are yellow with red edge and a few stripes of the same colour. We have on various occasions noted similar peculiarities, but never one more marked than that furnished by Mr. JEFFERIES.

was basalt, reduced to coarse powder mixed with cement, and while soft moulded into blocks and used as stone would be.

HOME CORRESPONDENCE.

NERTERA DEPRESSA.—This pretty little plant, which has a wide range over the mountain slopes of Australia, New Zealand, South America, Java, and other countries, has done well with me in the open for three years. It is planted on a ledge about 2 feet above the ground level, and faces north, being sheltered on the south by perpendicular rocks about 3 feet in height. It shares its ledge with *Shortia galacifolia*, *Ourisia coccinea*, and *Philesia buxifolia*, all of which are doing well, indeed the *Ourisia* is doing almost too well, for it has spread so that it threatened to incon-

name of this *Eryngium* is given as *E. amethystinum* (*Oliverianum*), conveying the impression that the two specific names are merely synonyms. *E. amethystinum* and *E. Oliverianum* are, however, two distinct species, and vary considerably in their habit. *E. amethystinum* (true) is a rare plant, and one that I have never met with in nurseries. It is often catalogued, but I believe, where that is the case, *E. Oliverianum* is almost invariably grown and sold under that name. In three nurseries I have met with *E. Oliverianum* labelled *E. amethystinum*. I possess both species, which differ so widely that the merest tyro, seeing them side by side, could not fail to discriminate between them. *S. W. Fitzherbert.*

CAMPANULA VIDALI IN THE OPEN.—I have a fine plant of this *Campanula* now in full bloom that is a very attractive sight. It flowered fairly well last season, the first year of its being

THE MELBOURNE BOTANIC GARDEN.

[See Supplementary Illustration.]

On various occasions we have spoken of the Melbourne Botanic Gardens, and the many improvements effected by Mr. Guilfoyle. The Supplementary Illustration issued with the present number shows a portion of the rock-garden, with *Dracenas*, *Agaves*, *Aloes*, *Opuntias*,

planted out, and I determined to experiment with it by leaving it undisturbed and unprotected in the ground through the winter. Rather to my surprise it endured the ordeal unharmed, not a leaf being injured. It is bearing thirty-three flower-spikes, the tallest being 35 inches in height and carrying 18 blossoms, while in all there are about 400 blooms on the plant. Its main stem is 9 inches in height and has a circumference of 4 inches. It is growing in a narrow border in front of a wall facing south-west. The long, white, drooping bells, which are very waxy and substantial in texture, standing out from the flower-stems on foot-stalks about 2 inches in length, some of which carry three blooms, have a pretty effect and give the plant a distinct character. Being a native of the Azores it is doubtful if even in the genial climate of South Devon it will brave many winters in the open. *S. W. Fitzherbert, Kingswear, South Devon.*

WEIGELA ROSEA.—In the early summer season of 1901 I had occasion to cut back two large bushes of this good old flowering shrub that were growing in front of the eastern windows of the house, and had somewhat overgrown the space allotted to them. I cut back all the strongest growths to about three eyes, with the result that they have made another break and produced a much finer lot of bloom than at the early and natural season. The present season I had occasion to treat the plants in the same way, with even better results; at the present time one plant has been well out for the past week, while at this season the flowers last much longer, and in the north-west suburbs of London, Harlesden, Craven Park. *G. A. Bromfield, 4, Newham Street, Bryanston Square.* [The flowers sent are finely developed. Ed.]

BLACK CURRANT.—Having grown the Giant of Boskoop for three seasons, in all of which it has proved most prolific, allow me to call attention to this new variety. Here it is a very strong grower, although the soil is cold and retentive. It seems particularly hardy, far more so than some others. It is a good bearer of very large black and sweet berries, and for this reason should prove good for the dessert. The bunches of fruit are somewhat short, but all, or nearly so, are of the same size, thus precluding waste. Indeed, so satisfactory has it proved that the other varieties will be discarded; though I intend growing Carter's Prolific, which is also of great merit, though more acid in flavour, and is undoubtedly a good bearer. William Lee's Perpetual has never borne a crop of fruit, all invariably being destroyed by the early frosts. This year the Black Naples fruits were unusually fine, though the flavour was far surpassed, as also was the size, by the Giant of Boskoop. *Harrison Weir, Poplar Hall.*

THE GARDEN-SHOW IN AUGUST.—This has been a wet and dripping, a cool and moist Holly-hock year. At Hampton Court they are (and have been) lovely now, single and double, and of nearly all shades. *Nymphaea gigantea* at Gunnersbury, and the Marliac Water-Lilies there, at Gravetye Manor, and at Kew Gardens, are the great floral sights of this August, so far as I have seen. The Bamboos at Kew also, like the Holly-hocks at Hampton Court, have enjoyed a climate that has spoiled Cannas and scarlet Pelargoniums. We cannot have everything at its best every season! The general average is good. Trees and shrubs I never saw better in gardens and parks everywhere than they are this year. *F. W. B.*

LAWN SAND.—My experience in the use of lawn sand may be of interest. On July 7, in the middle of the one dry period in this summer in the London district, I used it on a tennis-lawn at the rate of 4 oz. to the square yard, as recommended, in the hope of killing Daisies and improving the turf. The whole surface was temporarily browned, and now, six weeks later, after copious rains, there are still patches where the roots of the grass have been completely killed. A certain proportion of the Daisies have gone, but other weeds, such as *Ranunculus* and *Achillea*, have flourished exceedingly, and are much more numerous and ranker than on a second court on the same

stretch of turf which was happily left untreated. The court was in excellent condition for play in the early part of the season, but now hand-weeding and a fresh sowing of grass will be necessary, and there is little chance of its complete recovery by next spring. *E. S. R.* [The benefits resulting from the application of lawn-sand are not, as a rule, witnessed for some considerable time. At first ill effects often arise from the browning of the lawn in patches. A top-dressing of manure in winter, aided by a small proportion of fish guano, will do good. Nitrogenous manures, as a rule, improve the grasses at the expense of the weeds, but they should be used with discretion. Ed.]

POISONS.—The importance attached to the scientific study of agriculture and horticulture during recent years has naturally increased the demand for insecticides and fungicides for destroying animal and vegetable pests. Some of the chemicals used for these purposes, such as potassium sulphide, Bordeaux-mixture, lime and copper and ammoniated copper preparations, carbon bisulphide, white hellebore, tobacco-paper, kerosene emulsion, sulphur, ferrous sulphate, preparations of tar, quassia powder, and similar substances, do not come under the category of statutory poisons, and can be sold without restriction by anyone. A few, such as corrosive sublimate, Paris-green, white arsenic and its preparations, and potassium and sodium cyanides, come within the scope of the Pharmacy Act, 1868, and although these can be sold by wholesale to retail dealers if duly labelled with the seller's name and the word "poison," such substances cannot be sold by retail except by registered chemists—the persons specially trained to handle them—and then only subject to the strict regulations prescribed by the Pharmacy Act. *E. M. Holmes.*

HELIXINE SOLEIROLII.—This pretty moss-like Urticaceous plant, native of Corsica and Sardinia, is effectively used by Mr. J. O. Clarke, gr. to Ludwig Mond, Esq., for most of the purposes for which *Selaginellas* are generally used in plant-houses, and Mr. Clarke says that it is more adaptable and keeps better than any other plant of its kind. It is used to grow on the staging in the Orchid-houses, to fill in spaces in rockeries, for growing on the surfaces of *jardinières*, and for forming the ground-work of plant-covered walls. One old house has the back wall covered with *Helixine Soleirolii*, its pale-green slender sprays forming an admirable setting for the *Begonias*, *Ficus stipularis*, *F. minima*, *Adiantums*, and other plants whose healthy condition, growing on the wall, is mainly due to the shade and moisture ensured by the pretty little dwarf plant which covers the surface. *J.*

CEREUS CANDICANS AND C. C. DUMESNILIANUS.—The above plants have again flowered this year with me—a rather unexpected thing, as they did so last year. The flowers are of a very similar nature, but the former is much the larger, and they are not so short-lived as some of the family. A much larger plant of the former, about 6 feet high, has never shown signs of flowering yet, but perhaps it will do so in time. *Cereus chiloensis* had two or more flowers—they, as a rule, flower yearly; the *C. c. Dumesnilianus* is setting a seed-pod, that may be worthy of notice perhaps when ripe, if it does ripen, but of no value, of course, to me at least. *J. C.*

OPEN SPACES AROUND HAMPSTEAD.—A few days since, I went over the newly acquired open space known as Golders Hill, and was agreeably surprised to find plants growing there that are more often to be found in greenhouses, especially around our famous city. Golders Hill is a charming spot, well and heavily timbered, the grounds undulating. There are several spots here where it would be impossible to imagine you were within 5 miles of St. Paul's—the Quick hedges, the wild Roses, the partially hidden duck-pond, the wild rabbits, birds of nearly all sorts, the Apple orchard, meadows ablaze with wild flowers, and not a brick or chimney-pot to be seen, but everything reminding the visitor of the quietness of country life. In the artificial part, immediately surrounding the mansion, which was the former

residence of Sir Spenser Wells, were some fine bushes of *Camellias*, which flower well; they were certainly full of vigour and robust, and were in several localities, and in each spot they looked well. On the mansion (which, by the way, has been partially converted into cloak and refreshment-rooms for the public) is a very fine *Clematis montana* and some good *Roses*, and in an old conservatory was a very old plant of *Acacia dealbata*, with a stem some 18 inches in circumference: the plant covered the roof. Several beds are filled with *Roses*, and these looked very vigorous, and I should say the soil is suited for *Rose-growing*. There are some fine *Hollies* and also a hedge of *Hollies*. In the grounds there is a very large *Tulip-tree*, *Liriodendron tulipiferum*, and one which must have been planted soon after its introduction into this country, judging by its size. In another spot there is *Ginkgo* (*Maidenhair-tree*) towering away, and yet strong and thoroughly established; some fine *Willows* are also in evidence, and I noted a small but nice example of *Abies Webbiana* and of *Picea Smithiana* which looked very pleasing and ornamental. Some herbaceous plants were dotted about in a border, which had a Sweet Briar hedge as a background; and near to a small pond, practically hidden by long grasses, reeds, &c., were some bog-plants, which were as much at home as they would be 100 miles in the country. In other places bulbs have been planted by the former owner, and in the season they must have looked charming, as also did a colony of *Bluebells*. Some nice pieces of *Rhus Cotinus* were noticed. In many instances one could observe that the superintendent, Mr. Palmer, was handling the place in a business-like way, and making many improvements without disturbing the natural conditions. On Hampstead Heath proper I noted some very large *Willow-trees*—in fact, they were the best I have ever seen. I had little time, but could have well spent a whole day. The beautiful scenes that all Londoners can enjoy are something remarkable. *W. A. Cook.*

THE FLOWERING OF BAMBOOS.—I owe an apology to Lord Redesdale for having misunderstood the facts of his note on the above-subject, or rather for having mistaken them, owing to misquoting its substance during my absence from home. His lordship was so kind as to present us with "one *Arundinaria Simoni* from seed ripened in the open-air at Batsford in 1901," as also, "one *A. Laydekeri* from seed ripened in a Peach-house in 1902," and not with a *Phyllostachys nigra* seedling as I inadvertently stated in my communication in the *Gardeners' Chronicle*, August 8, p. 96. I should now like to point out that *A. Simoni* varies a good deal in the manner in which it flowers. Some individuals are practically all flower, viz., every growth upon them bears flowers, not alone the present year's side-growth from old culms, but even the growing basal growths also flowering. Such individuals, even if they recover ultimately, will suffer badly and be greatly weakened. Other clumps are only flowering on one or two out of many culms, and these, as I believe, may suffer very little or not at all. In some cases an enormous crop of heavy starchy seeds has been produced, but, as usual, "something else has also happened." Both mice and birds have eagerly availed themselves of the unwonted addition of Bamboo seeds to their food supplies. I do not know precisely what soil exists at Batsford Park, but here, on a night, warm, sandy alluvium, and near the dry and smoky air of the town, the fruiting clumps of *Arundinaria Simoni* look very brown and shabby indeed, very little new foliage having been produced this season. They look as though the whole energy of the plants has been diverted from vegetative growth to flowering and fruiting fertility. Plants that had culms heavily laden with plump oat-like seeds a fortnight or so ago have shed many seeds owing to high winds, but no doubt the bulk of the fruits have been devoured by grain-eating birds and animals. Now that so many species or varieties of Bamboos are becoming thoroughly well established in British gardens the chances are that every year some of them will flower and fruit, and it is quite possible that seedling and even hybrid variations may be raised; and it may be worth while to protect the seeds from being blown away by

rough winds, or from being stolen and eaten by birds and mice, as is pretty sure to happen if they are unprotected. *F. W. Burbidge.*

— In the *Gardeners' Chronicle* for August 8 there was an article on the flowering of Bamboos. I now enclose flowers taken from *Arundinaria Simoni* grown in the garden of O. O. Wrigley, Esq., Wansfell, Windermere. The plant looks very miserable, but it is now making a little new growth. This may interest your correspondent, *F. W. Burbidge*, and others. *Hy. Rothery.*

DR. BONAVIA AND THE FRUIT COMMITTEE.—

Some interest undoubtedly enters into the suggestions of Dr. Bonavia with respect to the palates of the members of the Fruit Committee and fruit-tasting at the Drill Hall. As I read the Doctor's criticisms I began to fear that he would invite the Council of the Royal Horticultural Society to furnish our table with claret, nauseous stuff, or some other chemical compound called wine, by the aid of which we might blunt nature's palates and provide artificial ones. Happily he stopped short of that proposal and fell back on Olives. I think we are perfectly capable of coming to a correct conclusion with respect to flavour in fruit without any such aids. What does Dr. Bonavia think of having to taste some twelve to twenty diverse Melons in succession, and yet in the end come to a right conclusion without any artificial aids? yet in so many fruits one may find just as many flavours. I notice at the table, where some twenty or more members may be present, and all possibly having somewhat different palates, yet if any fruit is good it is unanimously approved [and none left for the reporters to test. Ed.]. If it is not good, it is with equal unanimity objected to [and plenty left for the reporters. Ed.]. That shows that palates cannot be so corrupted by tasting diverse fruits as is imagined. I cannot say how far the smoking of tobacco may affect the palate, not being a smoker, but I know that if there be any excellences in fruit I am quick to select them, and I find other members do the same. Possibly all depends on what may be regarded as flavour. Thus we often have placed on the table Melons or other fruits, described as seedlings, which the senders pronounce to be of "fine flavour." Almost as often when so recommended the Committee find flavour entirely absent. I think it is this variable fancy, for it is little less, as to what constitutes flavour which exhibits the difference between the senders of fruits to the Drill Hall for tasting and the members of the Committee. With special reference to the Strawberry and Sultanieh Grapes, which Dr. Bonavia has at times placed before the Fruit Committee, do not the various opinions as to their flavours entertained by the Doctor and the Committee really lie in the fact that the flavours of ordinary Grapes, such as Muscat of Alexandria and Madresfield Court, for instance, are so different from what may be fitly described as the peculiar flavour of the Strawberry-Grape? The Sultanieh I was not present to taste on the 4th inst. Of the Strawberry-Grape the late Mr. A. F. Barron wrote "third-rate, but on account of its peculiar flavour and perfume is extremely interesting." It is no doubt that peculiarity in taste, which characterises the Sultanieh as much as the Strawberry, to which the Fruit Committee takes exception. I fear educating the members' palates up to the Strawberry-Grape standard is not possible. *A. Dean.*

STRAWBERRIES IN 1903.—The notes contributed by Mr. Bunyard (p. 70) are interesting and of practical value. They show the diverse behaviour of varieties on different soils. Many varieties that Mr. Bunyard recommends as doing well at Maidstone are almost worthless in these gardens. Royal Sovereign this season (doubtless owing to the wet) was very poor in quality. Young plants of this variety grow far too strong at Poltmore. The best returns are obtained from forced plants; young plants are only planted for supplying runners for forcing. The Laxton has not come up to expectations with me. It was a little firmer, and appears to crop better the first season than Royal Sovereign, and may prove better the second season. I am planting

all I can get for further trial. President is of little use with me, as also is Sir J. Paxton. Fillbasket has been better than I ever had it before; the colour is, I think, too pale, but it is a heavy cropper. Trafalgar I have discarded after three years' trial. Mentmore and Waterloo are other varieties I have ceased to grow. Latest-of-All is very variable, sometimes good, but does not colour well at the tip of the fruits. Mr. Carmichael's varieties I have grown, but they are not satisfactory in our soil; neither are Lord Suffield, nor Empress of India and Gunton Park. The two very best varieties I have in any season are Leader and Monarch. The last-named has a very brilliant surface, is a good traveller and an immense cropper. Leader beats it in size. Both these varieties are close and compact in growth. Until one has thoroughly tested the various Strawberry varieties now listed, it is better to plant sparingly. *T. H. Slade, Poltmore Park Gardens, near Exeter.*

SPECIFIC NAMES.—Sir W. T. Thiselton-Dyer has evidently read my note on this subject hastily, and has misunderstood it. Mr. C. Wolley-Dod having instanced *Inula royleana* (with no capital letter for the patronymic adjective) as a form adopted in the orthography of the Kew *Hand-Lists*, I quoted *Erigeron Roylei* and other examples as not adhering to the rule, if rule it is, which cannot be admitted. If this variation on one name can be defended, I shall be glad to know on what grounds. If one example or the other is not a specimen of "carelessness in compilation or in proof-reading," what is it? The new Kew *Hand-Lists* need no praise. They are a monument of industry which must earn their right meed of recognition; but I do not see why criticism of typographical errors is necessarily "ungracious." The errors are facts or not facts. If facts, the compiler is surely as deserving of a word of criticism on the point as any lesser mortal. Sir W. T. Thiselton-Dyer asks me to show instances of inconsistency. Let me refer him to p. 3 of the *Herbaceous Hand-List*, where within a few lines of each other we find *Acæna Nova-Zelandiæ* and *Acantholimon assyriacum*, and to p. 415, where appear *Dracocephalum ibericum* and *D. Moldavica*, as a couple of examples. But if Sir W. T. Thiselton-Dyer will refer once more to my note, he will find that it was written in whole-hearted support of his general system of use and non-use of capitals, which has no less claim to being a good system because he or his workers have indulged in occasional lapses from it through "carelessness in compilation or in proof-reading." *H. M. Batson.*

CLUBBING IN BRASSICAS.—In an issue of the *Gardeners' Chronicle* published in March last I read an article by Mr. Masee, in which he recommended the use of gas-lime against clubbing in Cabbages. The garden here has been infested badly with the pest for a number of years, but I am pleased to say that the gas-lime, used according to the directions given, has completely destroyed it. *H. T. W., Carricklee.*

LATE-BLOOMING APPLES.—Is there not a possibility of creating a race of late-flowering Apples by working up and through Court Pendu Plat or any other late-blossoming kinds which may be in existence. This season, wherever I have seen Court Pendu Plat, the trees have been clean, healthy, and carrying a reasonable crop of fruit. The late-flowering habit of this variety is, of course, well known and appreciated, but so far as I am aware no one has tried systematically by intercrossing with other kinds to create a race of late-flowering Apples. I have never until now had a cool house I could spare for the work. My idea is to give up a small orchard-house to Apple-trees in pots, of only a few kinds, Court Pendu Plat being one; the others to be selected from such free-bearing kinds as Bismarck, Stirling Castle, Lane's Prince Albert, Lord Suffield, Bramley's Seedling, &c. By growing the trees in pots it would be comparatively easy to retard the early-flowering trees, and to hasten the flowering of Court Pendu Plat by keeping the trees under glass. The idea is, of course, to manipulate the blossom with the scissors and camel's-hair pencil under glass until the fruits are set. Afterwards the trees may be plunged

outside. What I should be glad to know through the columns of the *Gardeners' Chronicle* is what (if anything) has been done in this direction. And as it would be (if it works out right) a national benefit to induce others who can attend to the trees, and can spare a house for them, to take the matter up, will the Editor kindly say what he thinks about it—and oblige many readers besides *Edward Hobday, Cambridge.* [We can but express general approval of the project, reserving our opinion as to details till another opportunity. Ed.]

FLORISTS' FLOWERS.

CARNATIONS AT WRETHAM HALL GARDENS, THETFORD.

ON the occasion of a recent visit to Wretham, I observed some remarkably fine blooms of Carnations. In one large span-roofed greenhouse there were on view about 1,200 plants, which bore evidence of having flowered abundantly, and were still making a fine display. Among these were King Arthur (a very large scarlet), Asphodel (a striking rosy-pink), and the lovely yellow Cecilia. Mr. Henley, the head gardener, also drew my attention to Horsa, Raphael, Champion, and Hildegard, all very beautiful. The plants are robust, and showed unmistakably the care and skill bestowed upon their cultivation.

In another house were some plants of Souvenir de la Malmaison Carnation in fine condition, among which in fine form were observed the varieties Nell Gwynne and Mrs. Everard Hambro. Flowering outdoors were 400 seedlings of border varieties, some of them of great promise. The owner of Wretham, S. Morris, Esq., is an enthusiastic horticulturist, and besides Carnations, which form a feature of the garden, he appreciates stove plants, Chrysanthemums, and hardy herbaceous perennials. *E. C. Parslow, Shadwell Court.*

TRADE NOTICE.

CHANGE OF TITLE OF FIRM.—Charles E. Livingston, of 127 and 129A, High Street, Dunfermline, N.B., has found it necessary, owing to a largely extended business, to take into partnership Mr. Thomas White, late manager of an Edinburgh firm. On and after July 20, 1903, the business will therefore be conducted under the style of Livingston & White.

LAW NOTES.

DISPUTE ABOUT SEED PEAS.

At the Redhill County Court on the 19th inst., before Mr. Manning, the Surrey Seed Company sued Clinton G. Hart, of 35, Nightingale Lane, London, E., for £2 17s. 7d. in respect of goods supplied. Mr. F. J. Flitton, secretary of the Company, stated that the defendant sent his firm an order for 4 bushels of King William I. Peas, which were forwarded to him. Defendant refused to accept delivery and the Peas were returned, but witness would not receive them, and they were now in the hands of the railway company. Defendant stated that the Peas which were sent were not according to order, contending that they were Early Green Kenilworth. He also submitted samples of King William I. Peas as supplied by Messrs. Webb & Co. and Messrs. Carter & Co., which he contended differed very materially from the Peas supplied. Mr. Flitton contended that what defendant expected was King William I. "Special" or "Improved." His Honour gave a verdict for the defendant with costs.

HORTICULTURAL SOCIETY'S BALANCE.

In the Wycombe County Court, Judge Marten had to decide the ownership of a balance of £180

in the hands of the treasurer of the late West Wycombe Horticultural Society. The society ceased operations two years ago rather than comply with the wishes of the lord of the manor, Sir Robert Dashwood, who declined to grant the use of his park for the annual show unless the tent for the sale of intoxicants was abolished. One of the members of the society entered a friendly action against the treasurer, and the Judge decided that the balance should be divided equally among all who were members at the time of the winding up. Another society, minus the objectors, has since been formed, and the wishes of the lord of the manor have been complied with.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

AUGUST 18.—*Present*: Dr. M. C. Cooke in the chair; Messrs. Holmes, Odell, Gordon, Michael, Saunders, Bowles, Douglas, Worsley, and Dr. Masters.

Ortles excelsa.—Mr. HOLMES showed a specimen of the bark of this Australian Protead, remarkable for containing aluminium succinate. The nearly allied *Grevillea* contains no aluminium.

Rubus roseifolius.—Mr. ODELL showed flowers and fruit of this *Rubus*, which has pinnate foliage of a light green colour, white flowers, and scarlet fruit.

Protijerous Cucumber.—Dr. MASTERS showed a remarkable specimen, in which from one fruit a second one had sprung, longer than the parent. This was from a specimen probably akin to those showing remarkable outgrowths of flowers from the axial part of the fruit, exhibited on a former occasion.

Hymenocallis Harrisiana.—Mr. BLISS sent bulbiform seeds of this plant in process of germination, which were referred to Dr. RENDEL for examination and report.

Viola Disease.—Specimens sent by Mr. BACON were referred to Dr. COOKE for examination and report.

Apple-tree, scorched.—A further letter was read from Mr. DOWSON relating to Apple branches shown at the last meeting. The dead bark does not peel off on the south side only, as it would do from sun-scorch, to which the mischief had been attributed, but on the north side also. Lightning was suggested as the probable source of injury, as no fungus could be detected.

Leaves discoloured.—Leaves were sent from Worthing affected with red-spider. There were traces of Honey-dew and of Smut-fungus (*Capnodium*).

Cucumber scale.—Dr. COOKE showed further specimens of Cucumbers affected with *Cladosporium scabiei*, which will shortly be illustrated in the *Gardeners' Chronicle*. A close atmosphere is favourable to the spread of these fungi, whilst a current of air is prejudicial to them. This has been observed by growers in the case of Tomatoes affected with *Cladosporium*.

Peas.—Mr. WORSLEY showed specimens of late Peas rotting near the base, whilst the foliage above turns brown and shrivels. This condition is very common this autumn, and is probably due to excessive moisture at the root.

THE FRUIT AND VEGETABLE COMMITTEE AT CHISWICK.

BEANS, MARROWS, AND MELONS.

AUGUST 21.—A meeting of the Fruit and Vegetable Committee was held at Chiswick on the above date.

Present: H. Balderson, Esq. (Chairman), and Messrs. C. Beckett, J. Willard, G. Wythes, H. Esling, G. Kelf, S. Mortimer, and A. Dean.

As the number of the Committee present was one short of the needful quorum only recommendations to the full Committee of Tuesday next at the Drill Hall could be made. These included a First-class Certificate to that fine Kidney Bean, hitherto without an award, although one of the best in commerce, Canadian Wonder, here very fine indeed, sent by Messrs. Sutton & Sons, Dobbie & Co., and J. Sharpe & Co. An Award of Merit was recommended to Dwarf Bean Reliance, a compact and most abundant cropper (Sutton & Sons); Kingston Gem, a green, loog-podded variety and a great cropper (Dean); and to Wythes' Early (G. Wythes), an early and very prolific variety. The Runner Beans of the rough or scarlet-flowered section were remarkably good, growth being first-rate. Of these Awards of Merit were

advised to Champion (Dobbie & Co.), a heavy cropper carrying long pods, and to Best-of-All (Sutton & Sons), also a superb podding variety. A similar award would have been advised to Prize-Winner, but it had previously been given. All the smooth-podded section of Runner Beans have done badly, evidently finding the weather too wet and cold.

Among Vegetable Marrows, which have largely suffered from the cold nights and heavy rains, awards were recommended to Defiance (Jas. Veitch & Son), a round green form, and to the Sutton Marrow, small oval white, very early and prolific.

Mr. G. Wythes brought bunches of the Japanese Wineberry to show its abundant fruiting properties, also a fine seedling Melon named Wythes Duchess, flesh very thick, smooth, and deep scarlet in colour, with green rind. It was the product of crossing Best-of-All with Syon House. Mr. G. Kelf, Regent's Park, showed a fine yellow-skinned and prettily netted Melon, having salmon-coloured flesh, named Regent's Park, the produce of crossing Frogmore Scarlet with Blenheim Orange; flesh thick and of delicious flavour. Awards of Merit were recommended for these two varieties. Considering the general conditions of the weather, and sunlessness, these two Melons seemed to possess in such a season exceptional merit.

Although rain fell heavily both morning and afternoon, the latter especially, making the gardens almost like a stream, the Committee were fortunate in finding a dry interval for their purposes. Had but one or two other members braved the weather as those present did, a full quorum would have been furnished.

WILTS HORTICULTURAL.

AUGUST 12.—The annual summer exhibition was held in the grounds of the Bishop's Palace, Salisbury, and was in every respect a successful one. Plants, if not so numerous as in some past years, were of excellent quality.

For a miscellaneous group for effect, 11 feet by 9 feet, Mr. A. Robey, gr. to Colonel LOYD, Hanham Cliff, Salisbury, was a good 1st with suitable plants not too closely arranged; Mr. A. G. BEDFORD, East Hanham Nurseries, Salisbury, was 2nd. For nine specimens Mr. G. Hall, gr. to Lady ASHBURTON, Melchet Court, Romsey, was 1st with grandly flowered specimens of *Allamanda Hendersoni*, *Bougainvillea glabra*, and one of *Cycas revoluta* in perfect health; *Kentia Belmoreana* and *Cocos plumosa*. Mr. Hall also won for six exotic Ferns with beautiful examples of *Davallia Mooreana*, quite 8 feet in diameter, *Microlepia hirta cristata*, and *Adiantum trapeziforme*.

Mr. J. Rockett, gr. to E. F. PYE-SMITH, Esq, Salisbury, was awarded the premier prize for six specimen Coleus, staging plants with brilliantly coloured foliage and trained in convex form.

Cut flowers were remarkable for numbers. For twenty-four Roses, Mr. Neville, gr. to F. W. FLIGHT, Esq, Cornstiles, Twyford, Winchester, was easily 1st with handsome blooms, having regard to the recent bad weather for Roses. His finest were Bessie Brown, A. K. Williams, Marie Baumann, and Souvenir de Pierre Notting. Dr. SEATON, Lyminster, was 2nd.

Dahlias were numerous, and Mr. J. BRYANT, Salisbury, was an easy 1st with twenty-four blooms, distinct. Mr. J. MILLER, Shenfield, was 1st for twelve show or fancy varieties, with large, shapely flowers.

Mr. NEVILLE easily secured the 1st prize for twelve bunches of Pompons, six of each, compact blossoms of varieties having decided colours.

Mr. J. PAGE, gr. to Miss SEYMOUR, Knowle House, Salisbury, was 1st in a keen competition for eighteen cut flowers; and for twelve Mr. H. Brown, gr. to the Hon. R. WYNDHAM, was 1st.

Carnations and Picotees were splendidly staged by Mr. NEVILLE, who secured the leading award for eighteen, having very handsome flowers of Dorothy, Mrs. F. A. Flight, Amphion, Gill Polo, Heather Bell, Bertha Nut-hall, and Countess Verulam.

Sweet Peas were plentifully exhibited. For twenty-bunches, Mr. A. MAPLE, Aldermoor, Shirley, was 1st with typical examples of leading varieties; and Mr. A. C. JONES, Exeter House, Salisbury, was 1st for twelve bunches with even better flowers than in the larger class.

Table Decorations are made much of at Salisbury. Miss M. CAREY, Stratford-sub-Castle, won the coveted place with an arrangement of dark Roses which was quite striking in effect. Mr. R. H. JEFFREY, Nursling, had an arrangement of Orchids, Lily of the Valley, Franca, Asparagus Sprengeri, &c., all of which were tastefully arranged, and deserved a better position.

Fruit was abundant in quantity and good of quality. For a collection of eight kinds Mr. HALL was 1st with very grand productions, especially Black Hamburg Grapes, Sea Eagle Peaches, and Pineapple Nectarines; Mr. W. MITCHELL, gr. to J. WILLIS FLEMING, Esq., Chilworth Manor, was 2nd. Black Hamburg Grapes in the class set apart for this variety were splendidly shown by Mr. MITCHELL, who was 1st without the

shadow of a doubt; as were also his Madresfield Court Grapes in the three bunch class for any other black variety. Melons were excellent, the variety Windsor Castle from Mr. ROBEY taking the 1st place. Sea Eagle Peaches were of huge size and finely coloured, winning for Mr. MITCHELL the 1st prize.

Non competitive Exhibits were attractive. Messrs. B. LADHAMS, Ltd., Shirley, Southampton, had hardy cut flowers in large quantity, among which Gaillardias were extremely fine. Mr. M. PRICHARD, Riverlea Nurseries, Christchurch, had a huge collection of a similar character, the *Gladiolus* of the Nancetanus, Childsil, and Lemoinei types being especially noteworthy.

ROCK FERRY HORTICULTURAL.

AUGUST 13.—Mrs. Paterson generously set apart a portion of her pretty garden for this exhibition, and instead of the overcrowding so noticeable last year there was ample space to stage the excellent show.

The groups of plants were arranged in square form. Dr. COOKE, The Brook (gr. G. Osborne), won the 1st prize in the larger class; 2nd, Mr. H. OGDEN. The smaller class was won by Mr. G. ATKIN (gr. H. Morris).

For six stove and greenhouse plants, Dr. COOKE was 1st with excellent specimens of *Bougainvillea Sanderiana*, *Acalypha Sanderiana*, *Allamanda nobilis*, and *Crotona Reidii*, *Chelodoni*, and *Weismannii*. Exotic Ferns were of fine quality from Mr. E. EVANS (gr. C. Jones); and there were handsome *Begonias* from Mr. ROBEY.

The gardens of the district are rich in herbaceous plants, and the competition in classes for these was keen. Mr. J. LEE won 1st prize.

Cut Roses were excellent. The 1st prize was won by Mr. R. KELLOCK (gr. R. Jones).

Cactus Dahlias lacked interest owing to their being unnamed; this want of attention was noticeable throughout the show.

Fruit was of the highest merit. Mrs. PATERSON (gr. T. Ferguson) won 1st prize for a collection with Muscat and Black Hamburg Grapes, Royal George and Stirling Castle Peaches, Pride of Stourbridge Melon, and Pineapple Nectarines.

The vegetables possessed excellent quality, the principal prize-winner proving to be Mr. H. D. TRE-LAWNY, Shotwick Park, Chester (gr. J. Clarke), who won 1st prize for a collection. *Orchid*.

LEITH HORTICULTURAL.

AUGUST 14, 15.—The twentieth show of the Leith Horticultural, Industrial, and Sports Society was held at Hawkhill Grounds on the above dates. The show was one of great merit, all the classes being well filled, the entries totalling 1071, and entirely filling the large marquee which in former years contained both the flower show and the industrial exhibition section. Competition was perhaps strongest in the classes for plants and cut flowers.

A class which usually excites great admiration is that for floral designs open to florists in Edinburgh and Leith. A much-admired design which was worthily awarded 1st prize was a beautiful cross and pedestal composed mainly of dark-purple Sweet Peas, the cross being relieved by white Sweet Peas and Lily of the Valley, while the pedestal made an exquisite background for a cluster of Stephanotis, pink Carnations, and Ferns. In all sections for tables of plants there were exhibited a standard of excellence which would have done credit to the Waverley Market shows.

In the class open to all for a table not to exceed 12 by 6 feet, arranged to produce artistic effect, 1st prize (a Silver Cup value £10) was easily won by Mr. Wm. JOHNSON, nurseryman, Portobello; Mr. PHILLIPS, Granton Road Nursery, secured the 2nd place.

In the Gardeners' Class for the best-arranged table of plants, Mr. A. ALEXANDER, Craighend Park, Liberton, took the 1st place; the 2nd prize being awarded to Mr. P. HUNT.

The Amateur section for tables of plants 8 feet by 4 feet, brought forward a large number of entries, and the competition was keen, the 1st prize, "Thos. Mackie Memorial Cup" (presented by Provost McKie), Gold Badge and £2, being secured by W. J. BRYSON, 53, East London Street.

For twenty-four Rose blooms, open to nurserymen, there were fine entries, the 1st Prize (Gold Medal) going to Messrs. DAVID W. CROLL, Dundee; 2nd, Silver Medal, to Messrs. HUGH DICKSON & Co., Belfast.

There was a fine display of *Violas* and *Pansies* (show and fancy) from Mr. JOHN DOWNIE, Beechill Nurseries (Silver Medal).

May Mr. FAIRLEY and his able assistants long enjoy the success which their enterprise merits! *Edina*.

CROYDON HORTICULTURAL MUTUAL IMPROVEMENT.

At a recent meeting of the members of this Society, a paper on "Orchard and Bush-fruit Pests and How to Combat Them" was read by Mr. A. Maslem, Bramley Hill House Gardens, and proved to be of great interest and practical utility. In the discussion that followed several interesting questions of detail were debated.

NATIONAL CARNATION AND PICOTEE.

(Northern Division.)

AUGUST 15.—This show was held at the Botanical Gardens, Manchester, but rain fell so continuously as to prevent the attendance of many visitors.

The show was better than had been anticipated, the chief exhibitors being Messrs. A. R. Brown, Birmingham; C. T. Thurston, Wolverhampton; T. Lord, Tordmorden; J. W. Bentley, Stakehill; D. Walker, Kilmarnock; J. Edwards, Moston; E. Kenyon-Shuttleworth, C. T. Budenberg, Marple; Messrs. Pemberton & Son, Walsall; and the Rev. C. A. Gottwaltz, Droitwich.

Twelve Carnations, Bizarres and Flakes, White Grounds.—This was a fine competition, Mr. T. LORD winning with capital flowers of J. S. Hedderley, Master Fred, Geo. Melville, Sportsman, Arline, Admiral Curzon, Mrs. T. Lord, Sarah Payne, Miss C. Graham, C. F. Thurston, Mrs. Shaw, and Gordon Lewis. 2nd, Mr. J. W. BENTLEY.

Six Bizarres and Flakes.—Six boxes were staged, Mr. J. MOSTON being 1st with J. D. Hextall, Pandora, R. Houlgrave, Gordon Lewis, Sarah Payne, and C. F. Thurston. 2nd, Mr. J. BROCKLEHURST.

Twelve Picotees, White Grounds, dissimilar.—The flowers in this section were of the finest type and purity. Mr. C. F. THURSTON was 1st with Mrs. Holder, W. H. Johnson, Pride of Leyton, Ganymede, Little Phil, Mrs. Gorton, Mrs. Openshaw, Brunette, Favourite, Thos. Williams, Henry Kenyon, and Lady Louise. 2nd, Mr. A. R. BROWN.

Six Picotees, White Grounds.—Ten boxes were staged, Mr. J. EDWARDS taking honours with a charming set—Mrs. Openshaw, Mrs. Beswick, Little Phil, H. Kenyon, Lady Louise, and John Smith; 2nd, Rev. C. GOTTWALTZ.

Twelve Selfs, not more than two of a variety.—Mr. A. R. BROWN led with perfect flowers of Avalanche, Bomba, Cadet, Snowdrop, Agnes Sorrel, Jenny Gough, Miss Alley, Snowdrift, R. Dean, Germania (2), Sir Bevy, and Teddy Galton; 2nd, Mr. C. F. THURSTON.

For six Selfs, the Rev. C. GOTTWALTZ was 1st.

Twelve Fancy or Yellow Ground Carnations or Picotees.—This was probably the finest class in the show, Mr. C. F. THURSTON'S 1st prize flowers being superb, consisting of Queen Bess, C. B. Thomson (2), Daniel Defoe (2), Czarina, Charles Martell, Argosy, Artizan, Diva, Countess Verulam, and Lady St. Oswald; 2nd, Mr. A. R. BROWN.

Six Fancy or Yellow Ground Carnations and Picotees.—Mr. D. WALKER'S stand was a model of neatness. The varieties were Edith, Helios, H. Falkland, Paladin, Gronow, and Charles Martell.

The single bloom classes brought out many choice flowers, perhaps the most handsome being the purple flake Carnations and the heavy-edged red and purple Picotees.

The best scarlet bizarre was Robert Houlgrave; the best crimson bizarre, Master Fred; the best pink and purple bizarre, T. Lord; the best scarlet flake, Sportsman; the best rose flake, Mrs. Rowen; the best purple flake, Gordon Lewis.

Picotees.—The best heavy-edged red was J. Smith; the best light-edged, Mrs. Gorton; the best heavy-edged purple, Mrs. Openshaw; the best light-edged purple, Pride of Leyton; the best heavy-edged rose, scarlet, and salmon, Mrs. Payne; and the best light-edged rose, scarlet, or salmon, Lucy.

Mr. J. EDWARDS had the Premier Carnation in J. B. Hextall, crimson bizarre; and Mr. A. R. BROWN, the best Picotee in Myra, a medium purple edge, and certificates. Certificates were granted the Rev. C. GOTTWALTZ for Myra and Lucy (a light-edged scarlet); and to Mr. B. SIMONITE, for Aurora, a heavy-edged rose.

TROWBRIDGE HORTICULTURAL.

AUGUST 18.—The fifty-fourth annual exhibition was held in the Flower-show Field, a large plot of land close to the railway-station, left by the late Mr. William Stancomb, the Lord of the Manor, to the Horticultural Society, on condition that a flower-show should be held at intervals of not more than three years, the field being vested in trustees, who are the magistrates of the town. The weather was fine, and there was a very large attendance.

The show all round was a remarkably good one; the Fuchsias, which were much in advance of any seen in other parts of the country, were a little under the Trowbridge mark, owing to lack of sunshine. There was a good display of Fruit, also of floral decorations; while the Vegetables were, on the whole, numerous and fine. There are many allotment gardens about Trowbridge; they are well cultivated, and the produce from them is always of a high order of merit.

Fuchsias always occupy the first place in the schedule of prizes. The best six plants came from Mr. H. POCOCK, Florist, Trowbridge, who had, of dark varieties, Brilliant, Dod's Favourite, and Charming; light, Arabella, Favourite, and one unnamed. Mr. GEO. TUCKER, Florist, Hilpertion, was 2nd. With four specimens, Mr. TUCKER came 1st, and Mr. POCOCK, 2nd.

Stove and Greenhouse Plants.—Mr. W. J. MANN, Trowbridge (H. Matthews, gr.), was 1st with well-grown and bloomed specimens, chief among them a fine example of *Ixora Pilgrimii*, one of *Rondeletia speciosa* major, also of *Erica Eweriana*, elegans, E. Irbyana, *Bougainvillea Sanderiana*, &c.; Mr. GEO. TUCKER was 2nd.

The best specimen foliage plant was a fine *Kentia* from Col. VIVIAN, Rood Ashton (gr., W. Strugnell); the best specimen flowering plant, *Stephanotis floribunda* from Mr. MATTHEWS.

Some excellently grown and flowered Zonal Pelargoniums were staged by Mr. GEO. TUCKER. Heathes were shown in nice-sized specimens by Mr. H. MATTHEWS, and Mr. GEO. TUCKER also.

Gloxinias were very good from Mr. TUCKER (1st); Messrs. W. J. STOKES & SON, Hilpertion, were 2nd.

Begonias were a very fine feature. Mr. H. FRY, Trowbridge, was 1st with six doubles and also with six singles, showing finely-grown specimens of excellent quality; Mr. W. P. CLARK, Trowbridge (gr., T. Tistock), was 2nd.

With four *Orchids* Mr. E. VINER, Frome, was 1st, he had nice plants of *Cattleya Gaskelliana*, C. Harrisoni violacea, *Vanda cœrulea*, and *Dendrobium Schroederi*; Mr. J. F. HALL, Wells, was 2nd, he had a piece of *Vanda cœrulea* in fine character.

GROUP OF PLANTS ARRANGED FOR EFFECT,

in two classes were bright and effective, but too much crowded; fewer plants would ensure a better effect with careful placing. Mr. ATCHLEY was 1st in the larger class, and Messrs. J. CRAY & SON, 2nd. In the smaller class Mr. J. KEMP was 1st, and Mr. ATCHLEY 2nd.

Some excellent Ferns were shown in twelves. Mr. A. P. STANCOMB, the president of the Society, was 1st with gold and silver Gymnogrammas, a very fine *Davallia Mooreana*, a beautiful specimen of *Gleichenia rupestris* glauca, *Adiantums*, &c.; Messrs. W. J. STOKES & SON, Trowbridge, were 2nd. *Caladiums* were shown by Mr. J. KEMP and Messrs. DAVIS & SON, Yeovil. *Coleus* were in the form of good brightly coloured bushes. Messrs. J. CRAY & SON were 1st, and Mr. H. MATTHEWS, 2nd.

CUT FLOWERS.

In this department Asters, Roses, Dahlias of all types, hardy flowers, annuals, and stove and greenhouse species were good. Mr. W. J. JONES, Bath, took the 1st prize for twenty-four quilled Asters, also for the same number of Victorias and Comet types, all very much finer than could have been expected, the quilled especially.

With twelve varieties of Roses shown in threes, Mr. J. MATTOCK, nurseryman, Oxford, was 1st; Messrs. PERKINS & SON, Coventry, were 2nd. For thirty-six single blooms Messrs. PERKINS & SON were 1st; and Messrs. TOWNSEND & SON, 2nd. For twenty-four varieties, Mr. J. MATTOCK 1st, and Messrs. TOWNSEND & SON 2nd. For twelve varieties Messrs. PERKINS & SON were 1st. Messrs. TOWNSEND & SON were 1st for twenty-four Teas; and Messrs. PERKINS & SON, 2nd.

Messrs. GEO. COOLING & SON, Bath, were 1st in a class for eighteen bunches of garden Roses, with very fine and striking bunches of Madame Falcot, Midle de Massing, Coallina, La France, Gruss an Teplitz, Safrano, Irish Beauty, Madame Pernet, Papa Gontier, &c.; Mr. J. MATTOCK was 2nd.

With twenty-four bunches of hardy flowers, Messrs. J. STOKES & SON were 1st, showing a very fine lot.

With twelve show Dahlias, Messrs. J. CRAY & SON were 1st, having excellent blooms; Mr. G. HUMPHRIES, Cheltenham, was 2nd.

Messrs. CRAY & SON, who are undoubtedly coming to the fore as cultivators of Dahlias, were 1st with twelve very good fancy varieties; and Mr. J. WALKER, 2nd.

Single Dahlias were in excellent character, the best twelve bunches came from Mr. T. CARR, Tiverton, a little large but very fresh; Messrs. J. CRAY & SON were 2nd.

With twelve bunches of Cactus Dahlias, distinct variety, Messrs. J. CRAY & SON were 1st, having finely developed blooms. The new white variety Winsome, of which they speak in the highest terms, was fine; Mr. G. HUMPHRIES was 2nd.

With twelve Gladioli, Mr. J. MATTOCK came 1st.

FRUIT AND VEGETABLES.

The best collection of ten varieties of fruit came from Mr. H. JONES, Bath, who had Gros Maroc and Muscat of Alexandria Grapes, Sea Eagle Peach, Pineapple Nectarine, Jefferson's Plum, Apricots, Melon, &c.; Col. VIVIAN, Rood Ashton (gr., W. Strugnell), was 2nd.

With six dishes, Mr. W. OLIVER, The Gardens, Littleton Panell, was 1st. He had Muscat of Alexandria and Alicante Grapes, Nectarines, Apples, &c. Mr. STRUGNELL was 2nd.

Grapes were shown well in several classes. Peaches, Apricots, Nectarines, Plums, Cherries, &c., were somewhat sparingly shown, and of generally good character. The best two dishes of culinary Apples were Warner's King and Peasgood's Nonsuch, from Mr. J. F. HALL. The best two dishes of dessert Apples were Beauty of Bath and Worcester Pearmain. Some nice fruit of Lady Sudeley were staged.

Vegetables were good for the season, and a large number of collections was staged. Mr. B. C. WATTS,

Hilpertion Marsh, won the 1st of Messrs. Sutton & Sons prizes for six kinds of vegetables; and Mr. A. S. SOMERVILLE, Wells, was 2nd.

A very fine collection of cut Begonias was staged by Messrs. BLACK & LANGDON, Twerton Hill Nursery, Bath.

ROYAL HORTICULTURAL OF ABERDEEN.

AUGUST 20, 21, and 22.—This Society held its Annual Exhibition on the above dates, in the Duthie Public Park, Aberdeen. The arrangements of the show were much the same as in preceding years, but so large were the number of entries—1800, nearly 200 above those of last year—that no little difficulty was experienced in getting the exhibits all properly staged. Mr. J. B. RENNET, Advocate, Aberdeen, the courteous secretary, and the judges were on the ground by 7 A.M.

Considering the unfavourable weather which has been experienced, the display made by the gardeners of the north-east of Scotland was little short of marvellous.

POT PLANTS.

The large marquee devoted to this section was a splendid show. For twenty stove or greenhouse plants in pots, Mr. John Proctor, gr. to Sir WILLIAM HENDERSON, Devanha House, Aberdeen, won the 1st prize.

For the best six stove or greenhouse plants, distinct, Mr. PROCTOR again scored a worthy victory. The Society's Silver Medal for the best specimen plant in flower was taken by Mr. William Kilgour, gr. to Mr. Webster, of Edgill; Mr. WILLIAM SCORIE, Aberdeen, making a good 2nd. For the best specimen foliage plant, open to all, Mr. JOHN SIM, Glenburnie Park, Aberdeen, took the Silver Medal; Mr. PROCTOR being 2nd.

Pelargoniums were a splendid class, Mr. J. M. SIMPSON, Varvil Bank, winning the Medal; and Mr. ALEX. DOUGLAS, Kepplestone, being 2nd. Mr. JOHN SIM, Glenburnie Park, carried off premier honours for plants for dinner-table decoration. The Medal for double Begonias was taken by Mr. KILGOUR, Edgill, and for the single varieties by Mr. H. SKRNE, Garthdee House. Mr. WILLIAM WOOD, Priory Hill, Culter, was 1st for Petunias.

In the Carnation class Mr. W. SCORIE, showed capital, and he was closely followed by Mr. JOHN YULE, Craibstone House, Bucksburn. The other exhibitors worthy of mention, and the sections in which they were supreme, were as follows:—Mr. J. M. SIMPSON, Varvil Bank, Fuchsias; Mr. A. DOUGLAS, Kepplestone, zonal Pelargoniums; Mr. JOHN SIM, Gloxinias; Mr. JOHN BLACK, Aberdeen, early-flowering Chrysanthemums; Mr. JOHN PROCTOR, *Celosia pyramidalis*.

CUT FLOWERS.

The show of cut flowers was far in advance of that of last year. In the Professional class, Mr. GEORGE McLENNAN, Fetteresso Castle, Stonehaven, took premier honours for twenty-four Rose blooms, dissimilar, with a fine entry; Mr. ALEX. DOUGLAS, Kepplestone House gardens, being 2nd. Mr. ALEX. DALGARNO, Woodville, Arbroath, carried off the Silver Medal for twelve Rose blooms, H.P.; Mr. W. COUTTS, Ellon, being 2nd.

For six Teas or Noisettes, Mr. ALEX. BRENNER, Dalhobby, Bieldside, led. Mr. ANDREW GARDNER, Kenney House gardens, led for twelve double Dahlias. Mr. JAMES JAMESON, Hawhill, Milltimber, took the Silver Medal for six varieties of Pompon Dahlias, and Mr. ALEX. GRIOR, Fairfield, Aberdeen, took similar honours for the best twelve Cactus Dahlias.

Mr. ALEX. DOUGLAS, Kepplestone, took the Silver Medal for twelve bunches of hardy herbaceous flowers; and for a collection of twenty varieties of cut flowers and fine foliage bedding plants, the Medal was taken by Mr. SAMUEL ROBERTSON, gr., Ferryhill House, Aberdeen. For Carnations or Picotees, Mr. M. L. LOW, Elgin, was winner.

FRUIT.

In the Professional class, as is his wont, Mr. ALEXANDER HUTTON, Usan House, Montrose, carried off the principal prizes, (being 1st for a collection of nine dishes, also for four bunches of Grapes, one bunch of Grapes, Melons, Peaches, dessert and cooking Apples, and Tomatoes, a record for which Mr. HUTTON deserves to be heartily congratulated.)

Mr. A. GRIBOR, Fairfield, was 1st for two bunches of black Grapes, and Mr. JOHN PETRIE, Crathies Castle, Kincardineshire, 1st for Muscat Grapes.

Mr. G. TAYLOR, Inchgarth House, made splendid exhibits of hardy fruit.

Mr. J. FERROUSON, Linton House, Cluny, forwarded good specimens of Gooseberries, and deservedly scored in these classes.

Strawberries, as can well be understood, owing to the wet season, have been a comparative failure this year; nevertheless, one would not have thought so on seeing the beautiful specimens put forward by Mr. A. PATERSON, Ruthrieston, Aberdeen.

For Raspberries, Mr. A. DOUGLAS, Kepplestone House, took premier place.

VEGETABLES.

For the best collection of vegetables comprising the nine commoner varieties, Mr. ALEXANDER PATERSON, Ruthrieston, was 1st; Mr. JAMES GRANT, Rothienorman, and Mr. FRANK KINNAIRD, Broomhill, Aberdeen, being 2nd and 3rd respectively.

Mr. WILLIAM LEITH, Lodmay, won the Society's Silver Medal for the best collection of seven varieties of vegetables; Mr. D. THOM, Woodside, being 2nd.

The other more prominent names in the prize list included Mr. ALEX. GRIGOR, Fairfield, salads; Mr. JAMES SMITH, Kaimhill, Cabbages; Mr. FRANK KINNAIRD, Carrots; Mr. JOHN PATERSON, Denwood, Cauli-flowers; Mr. ALEXANDER BREBNER, Dalheby, Cucumbers; Mr. A. HUTTON, Usan House, Montrose, Onions and Leeks; and Mr. JOHN KINNAIRD, Peas.

In the Potato classes there was keen competition. The Society's Silver Medal for the best collection comprising four varieties was secured by Mr. T. B. Middleton, gr. to Sir ARTHUR GRANT, Bart., of Monymusk, Aberdeenshire; Mr. JOHN YULE, Craibstone, was 2nd; and Mr. WILLIAM MILNE, Corsindae House, 3rd.

Mr. A. PATERSON, Ruthrieston, was 1st for a collection of four varieties, closely followed by Mr. COUTTS, Ellon.

NURSERYMEN'S EXHIBITS.

The displays made by the nurserymen and florists were good. Messrs. D. & W. CROLL, Dundee, swept the board with their magnificent collections of Roses.

Mr. WILLIAM A. DUSTAN, Holburn Nurseries, Aberdeen, was 1st for Dahlias.

Wreaths were a fine show, Messrs. KNOWLES & SONS, Aberdeen, taking the lead with exquisite specimens composed of Stephanotis, Lillum Harrisii, Lily of the Valley, and Tea Roses.

Mr. ALEX. BURNS, Jun., had the best decorated dinner-table.

Messrs. BEN REID & CO., Aberdeen, had an attractive stand (non-competitive), on which were displayed Lilliums, Codiaums, stove and greenhouse plants, wreaths, bouquets, a broken column of variegated Ivies, and Gladiolus.

A large space was occupied by Messrs. COCKER & SONS, Aberdeen (non-competitive), who brought together a superb collection of rare varieties of herbaceous plants, Phloxes, &c.

Messrs. W. SMITH & SONS, Burnside Nurseries, Aberdeen, had also a very fine honorary display, their stand occupying about 80 feet of staging.

The weather was moderately good throughout the three days, and financially the show was much more successful than last year, the sum obtained being £30 above that obtained last year.

DEVON AND EXETER HORTICULTURAL.

AUGUST 21.—The 197th exhibition of the Society was held at Northernhay, one of the best kept and most beautiful of the pleasure-grounds of the city of Exeter. Taken as a whole, it was one of the most successful shows of recent years, and with the exception of fruit, the exhibits were above the average in merit.

It is to be regretted that some of the best gardens in the neighbourhood are not usually represented at this show, such as Poltimore, Killerton, Bicton, Streatham Hall, Culver, Stover, &c.; the only exhibit from any of these fine gardens being an honorary one from Poltimore.

CUT FLOWERS.

For twenty-four Dahlias, double, show, and fancy, the 1st prize was awarded to Messrs. JARMAN & CO., Chard, amongst whose blooms were Miss Cannell, James Vick, Gloire de Lyon, Julia Wyatt, and Harrison Weir.

For twenty-four Cactus Dahlias, Messrs. W. B. SMALE & SON, Torquay, were 1st with a fine lot, which included Noonday, Lucky Star, Khaki, Ignea, and Beauty of Eynsford, all fresh and well done.

The 1st prize for forty eight spikes of Gladioli went to Mr. S. BIRD, Wellington, for rather a poor lot; and the 1st prize for twelve Tea Roses to Messrs. JARMAN & CO. The competition for the decorated table (fruit and flowers) was keen, and brought out some good work, the 1st prize falling to Mr. GEO. LOCK, Crediton.

PLANTS IN POTS.

For twelve stove and greenhouse plants, Mr. W. BROCK, Exeter (gr., W. Rowland), was 1st, in whose lot were fine specimens of Codium Andraeanum and Cycas revoluta. Mr. BROCK was 1st also for six specimens (three in flower and three foliage), and for six stove and greenhouse plants, showing Ixora Prince of Orange, Bougainvillea Sanderiana and glabra, Cassia corymbosa, and Clerodendron Balfourii, very well. Mr. BROCK was also 1st for six stove and greenhouse Ferns. For a group of plants, 11 feet by 15 feet, Mr. BROCK was an easy 1st. For the smaller group, 11 feet by 8 feet, Mr. W. F. LORING, Knightleys (gr., W. R. Baker), was 1st with a well-arranged collection of small but effective plants.

Mr. W. B. HEBERDEN, C.B., Elmfield (gr., E. Cole), was 1st in each class for six foliage Begonias, six Dracaenas, and six Caladiums. Among his best Cala-

diums were Mrs. Harry Veitch, Bicolor splendens, Marquis of Camden, and Gaston Chandon. Mr. LORING was 1st for six Cockscombs, better plants than are usually shown at this meeting. Mr. T. KNAPMAN (gr., F. Protheroe) was 1st for six Pelargoniums, showing Snowstorm and Mrs. Ewens in good form.

The 1st prize for six double tuberous-rooted Begonias was awarded to Mr. H. C. WARE, Exeter; the 1st prize for six single Begonias going to Mr. H. TURNER, Exeter, who also secured 1st for six Coleus.

FRUIT.

For a collection of eight dishes of fruit premier honours went to Sir J. SHELLEY, Shobrooke Park (gr., H. Mairs), who included Muscat of Alexandria and Madresfield Court Grapes, Barrington Peaches, Pineapple Nectarines, Beauty of Bath Apple, Moorpark Apricots, Hero of Locking Melon, and Cullen's Golden Gage Plum.

In the five dishes collection, Sir JOHN FERGUSON-DAVIE, Creedy Park (gr., W. Seward), was 1st, showing Black Hamburg Grapes, Sea-Eagle Peaches, Kirke's Lord Nelson Plums, Victoria Nectarines, and Hemsirkir Apricots, in good form.

Mr. BANNATYNE, Haldon House (gr., J. Ellicott), was 1st for Black Hamburg Grapes; and Rev. HAMILTON GELL, Winstlade (gr., G. J. Barnes), for Muscat of Alexandria. For Madresfield Court Grapes, the Rev. H. CLERK, Exmouth, was 1st; and for Buckland Sweetwater, Admiral PARKER. Among the winning kinds of fruit were Barrington Peach, Victoria Nectarine, Lord Suffield and Irish Peach Apple, Jargonelle Pear, Moorpark Apricot, Brunswick Fig, and Black Alicante Grapes, all, considering the season, being well shown.

VEGETABLES.

This is always the strongest class in the show, and competition keenest. Sir JOHN SHELLEY again took premier honours with a magnificent collection which included Ailsa Craig Onion, Renton's Monarch Leek, Veitch's New Intermediate Carrot, Standard Bearer Celery, Perfection Tomato, Red Garden Globe Turnip, Lord Roberts Cucumber, Duke of Albany Peas, Autumn Giant Cauliflower, Best-of-All Runner Beans, Up-to-Date Potatoes, and Hollow Crown Parsnips—a splendidly-grown and well-shown collection in every respect.

In the smaller collection, Sir DUDLEY KING, Weir House (gr. S. Baker), was 1st with nearly the same varieties. The single dishes, which were hotly contested, were also nearly of the same kinds, excepting Veitch's Scarlet Model Carrot, which is always well shown at Exeter, and Potatoes, which constitute a very strong class at all Devonshire shows.

The 1st prize in the class for Tomatos was won by Sir DUDLEY KING for a good dish of the variety Cannell's King.

The 1st prize for Shallots was awarded to Mrs. SAVILE, Barley House (gr., J. Rogers), for a dish of bulbs of Veitch's Purple Exhibition of extraordinary size.

TRADE EXHIBITS.

Messrs. ROBT. VEITCH & SON, Exeter, in a large and interesting collection, showed the Golden Beech (Fagus Zlatia), Lonicera Hildebrandti, Tamarix aestivalis, Cocos australis, Beaufortia splendens, Corydalis thalictroides, and other novelties (Certificate of Merit).

A Certificate was also awarded to Messrs. W. B. SMALE & SON, Torquay, who showed a large collection of Dahlias; THE DEVON ROSERY CO. (Curtis, Sanford & Co.) had a fine stand of Roses, also a fine collection of Apples from their fruit farm at Cockington; Mr. W. J. GODFREY, Exmouth, had a fine collection of Pelargoniums; Messrs. JARMAN & CO., Chard, and TUPLIN & SONS, Newton Abbot, also showed collections.

ANNUAL EXCURSION OF THE ENGLISH ARBORICULTURAL.

FOLLOWING close upon the heels of their Scottish confrères, the members of the above Society, as we have already mentioned, held their Twenty-second Annual Meeting at Reading, on August 17, for the purpose of visiting the estates of Highclere, Longleat, and Savernake.

HIGHCLERE.

The first-named of these estates was visited on Tuesday the 18th, and the park and woods were inspected under the guidance of Mr. W. Storie, head forester. The magnificent Cedars of Lebanon near the castle came in for a good deal of attention, the largest girthing nearly 20 feet at 5 feet up, while other trees of interest near the castle were Carya alba 60 feet high and 9 feet in girth, and Abies cephalonica, 80 feet high and 11 feet in girth. The remains of an ancient Yew under the castle walls were said to be 1,050 years of age and had every appearance of being the oldest tree on the estate. After inspecting the stud-farm, the Society was entertained at lunch by Lord Carnarvon, who was represented by his agent, Mr. Rutherford. The sawmill was then inspected, and the woods round the lake walked through. These woods contain fine specimens of the commoner Conifers, Corsican Pine, Silver Fir, Menzies Spruce, Weymouth Pine, Douglas Fir, &c., being exceptionally fine, a specimen of the last-named being said to rival the famous tree at Dropmore.

LONGLEAT.

On Wednesday the party journeyed by special train to Westbury, whence they drove to Longleat, an account of which had been written for the Society by Mr. A. C. Forbes, from which the following is an extract:—

"This house stands on the site of a small Priory, founded by Sir John Vernon, Lord of Horningsham, in the fifteenth century. This priory was dissolved by Henry VIII., and after passing through various hands, it was purchased by Sir John Thynne about 1540. The present mansion was commenced about 1566, and over £80,000 are said to have been expended on it in labour alone between that date and 1579. The house did not acquire its present form, however, until about 1680. About that period extensive gardens and groves were laid out by London and Wise and two of their colleagues, who took it in turn to superintend the work. Beyond that part of the park known as 'The Grove,' little of these gardens now remain, and the greater part of the site they occupied was thrown into the park by 'Capability' Brown about 1760.

"The greater part of the park (together with the Lower Woods) occupies what was once part of the old Forest of Selwood, in which Alfred is supposed to have collected his followers before attacking the Danes. This forest extended for a considerable distance into Somersetshire, and many parts of the district retain their character to this day. The main avenue leading to Horningsham was probably planted about 1680, and originally consisted of Elms, only a few of which now remain. The gaps have been filled up with various species. The Beech woods and other clumps on Park Hill were planted by Brown about 1760, but except on the north side, his characteristic but formal clumps are not greatly in evidence, and the slopes of the park above the main avenue furnish one of the finest examples of the natural style of landscape gardening in the country. The most noteworthy of the park timber consists of Oaks, Elms, Limes, and Poplars, and those standing in the Grove cannot be excelled in the county of Wilts, taking the quantity of timber and the area on which it stands together.

"The Longleat woods cover an area of nearly 4,000 acres. Of this area about 1,500 acres stand on the Oxford clay, and either clay or loamy soils; about 500 acres are on the chalk, and the remainder are on greensand. On the first-named soils, coppice, with standards, is the prevailing sylvicultural system, and the species met with are Oak, Ash, Hazel, &c. On the chalk mixed plantations of Larch, Corsican and Austrian Pines, Birch, &c., planted for shelter and game, predominate. On the greensand Larch, Scotch Fir, Birch, and Oak constitute three-fourths of the crop, and three-fourths of the entire area are contained in one block of woodland. The species which succeed best and prove most profitable on the greensand are Larch, Douglas Fir, Silver Fir, and Weymouth Pine, and Conifers generally grow rapidly. Beech also does well, but Oak is apt to be shaky, although growing to a fair size. Spanish Chestnut, either in the form of coppice, or as a mixture with Larch, does well, and is very profitable if not allowed to stand for long.

METHODS OF WORKING.

In the coppice with standards the woods are divided into areas of convenient size for cutting, and worked on an average rotation for fourteen years. Where Ash, Alder, &c., predominate this rotation is being lengthened by twenty years, in order to produce pit wood. Where the standards are thin and only consist of ripe timber, the ground will either be filled up with Ash and Oak for standards, or planted up as high forest, according to soil and situation.

"In the Coniferous woods clear felling is adopted in mature woods, the area cleared being about 10 acres annually, the greater part of the woods consisting of Scotch Pine, for which there is no outlet except for pit wood. Felling on a large scale is not possible without disorganising the local market for this timber. A considerable extent of over-ripe Scotch Pine is consequently still standing, but as the ground cleared during the last fifty years has been replanted with Larch and other species of a more profitable nature, more extensive clearings will ultimately become practicable.

"The chief market for Coniferous wood is the Radstock coal field, about 16 miles distant, which takes all kinds of rough hard wood timber, Scotch Pine, Larch, &c., at so much per ton. Larch makes about 1s., Scotch Pine 8d., Spruce and Silver Fir 7d., and Oak about 1s. 3d. per foot in the wood when sold for this purpose, and the largest pales in coppice wood are worth about 14s. per ton. Hazel coppice of fourteen years' growth makes from £1 to £1 10s. per acre, while good pole wood of twenty years' growth will make from £8 to £12 per acre. The market prices for Oak, Ash, Birch, &c., are similar to those prevailing in most parts of the South of England.

"The following particulars of a group of Silver Firs growing on about one-third of an acre of ground will illustrate the growth of this tree on the greensand. It is 120 years of age, and the number of trees it contains is twenty-seven. The largest girths at 5 feet up 14 feet 1 inch, and the smallest 6 feet 5 inches. Their height is about 130 feet, and their average cubic contents are 180 feet, or 5,000 feet in all, equal to a stock of 15,000 feet per acre.

"Among other trees in the Longleat Woods may be mentioned:

Table with columns: Tree Name, Girth at 5 ft., Height. Includes Tulip-tree, Sequoia sempervirens, Ginkgo biloba, etc.

After visiting Huren's Gate, from which an extensive view into Somersetshire may be obtained, a visit was made to the grove in which stand the large Oak, and some remarkably fine Limes and Poplars, the former said to be the tallest in England, being 130 feet in height.

SAVERNAKE.

On Thursday a long train journey was again undertaken, in order to visit the ancient forest of Savernake. After walking through some of the woods, containing some very fine Larch-trees, the park was entered by the Cathedral Avenue, consisting, as do all the Savernake avenues, of Beech.

Tottenham House was visited, and the Marquis of Ailesbury was represented by his daughter, Lady Margaret Bruce, who accompanied the party in their inspection of the pictures and heir-looms of the Bruce family, amongst which are the sword and hunting-horn of Robert Bruce.

Proceeding to the gardens, an object of the greatest interest to foresters in particular and arboriculturists in general was inspected. This was one of the original Larches brought from Tyrol by the Duke of Atholl, about 1740, and presented by him to the then Marquis of Ailesbury.

Before leaving the home farm after lunch, the Marquis of Ailesbury himself joined the party, made an interesting speech on the subject of the avenues, inviting those present to advise him as to the best way of renewing them.

On Friday the Society visited the seed warehouses and trial grounds of Messrs. Sutton & Sons at Reading, and were entertained by the firm at luncheon.

THE WEATHER.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period August 16 to August 22, 1903. Height above sea-level 24 feet.

Large table with columns: Date, Direction of Wind, Temperature of the Air (At 9 A.M., Day, Night, Rainfall), Temperature of the Soil at 9 A.M., and Lowest Temperature on Grass.

Remarks.—Strong winds and showery weather have been the prevailing features during the past week.

THE WEATHER IN WEST HERTS.

Cold, Wet, and Gloomy Weather.—The present cold, wet, and gloomy period has now lasted more than six weeks, during which time there have been only three days when the temperature in the thermometer-screen rose above the average for the time of year.

MARKETS.

COVENT GARDEN, August 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report.]

PLANTS IN POTS, &c.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots such as Acers, Adiantums, Aralias, etc.

CUT FLOWERS, &c.—AVERAGE WHOLESALE PRICES.

Table listing prices for cut flowers such as Alstroemeria, Asters, Azaleas, etc.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits such as Apples, Bananas, Cobnuts, etc.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing prices for various vegetables such as Artichokes, Beans, Carrots, etc.

REMARKS.—Plums are easier in price. There is a good supply of foreign Swizens at 3s. to 4s. the half-bushel; Gisborns, 5s.; Victorias, 8s. to 9s.; Diamonds, 7s. 6d.; Australian Oranges, in cases of 120 to 140, are 6s. to 8s., quality poor; Californian New Town Apples, in case, 8s.; French Tomatoes, in boxes, 2s. to 2s. 6d.; in crates, 4s. Corn Cobs, per dozen, 2s.; Mangos, per dozen, 6s.; Aubergines, per dozen, 2s.; Salsify, per dozen, 4s.; home-grown Endive, per score, 9d. to 1s.

POTATOS.

Home-grown, 70s. to 100s. per ton. John Bath, 32 & 34, Wellington Street, Covent Garden.

ANSWERS TO CORRESPONDENTS.

ADDRESS WANTED: Hortus. We have no means of knowing.

ASIA MINOR: F. & Co. We can only answer your question in general terms. The climate is hot and dry in summer, bitterly cold in winter.

BEGONIA GLOIRE DE LORRAINE: Greenlands. The plant seems to have been growing very rapidly, and then during that time has received a check at the root.

BEGONIAS: F. E. G. The leaves have been injured by mites, a species of Tarsonymus, invisible to the naked eye.

BRASSICA STEMS BORED BY INSECTS: H. T. W. Probably the work of a species of two-winged fly belonging to the genus Anthomyia, and allied to the Cabbage-fly, A. brassicæ.

make your seed-beds on entirely fresh ground, and see that the plants do not become overcrowded. Transplant also to fresh ground or where a good succession of crops has been grown; and after planting out sprinkle a band, about 6 inches wide, of fresh gas-lime between the rows. It is most important that all infected plants should be removed and burnt.

CARNATIONS: *R. C. B.* All good border varieties. Of the three we prefer the yellow-striped variety. The red one is useful as coming later. The white is not pure enough and seems liable to burst its calyx. Considering the season, they are all good flowers.

CUCUMBER LEAF-SPOT: *Telegraph.* We will answer your questions in our next issue.

GRAPES FAILING TO COLOUR: *G. H.* If the Grapes colour very irregularly, it is due to some detail in the cultural conditions being more or less unsuitable. It occasionally happens, however, that in bunches otherwise well developed and perfectly coloured, there is one or more berries that remain perfectly green. Unless this be due to imperfect fertilization, it is difficult to arrive definitely at the true cause.

GRAPE ROT (GLEOSPORIUM AMPELOPHAGUM): *Bewildered.* The bunch of Grapes sent for examination appears to be undoubtedly infested with Grape-rot, or anthracnose of the Vine, of which we must refer to a long account in the *Gard. Chron.*, July 8, 1893, p. 93, since which time it has very frequently occurred in this country. Unfortunately we have failed to find conidia in the present case, as the pustules appear to be immature, but the external appearance and incipient pustules seem to indicate the species we have named. It is unnecessary to urge again that all the species of this genus of fungi are dreadful pests, and every trace should be destroyed as soon as it appears, whether on the fruit, leaves, or twigs, for it affects them all. We find on some of the Grapes that *Penicillium glaucum*, the common blue mould, has developed. This is not strange, for it will attack anything vegetable; but Sorokin has figured it, in a Russian work, as a parasite of Grapes. *M. C. C.*

GRAPES: *Query.* We are not prepared to express an opinion unless we see specimens.—*Perplexed One.* There is no injurious fungus on the berries received, but only a mould which has grown after the berries have cracked. The cracking is most likely due to injudicious watering, and it is frequently the result of flooding a border with water after it has been allowed to become drier than it should be.

HOLLYHOCK: *W. F.* The Hollyhock - fungus. Burn the shoots at once. Spray the young plants next season with liver-of-sulphur, $\frac{1}{2}$ oz. to a gallon of water.

MEALY BUG ON VINES: *J. E.* Kerosene emulsion is an excellent winter dressing for Vines, but before applying this it is necessary to look carefully over the rods when the pruning has been done, and remove every vestige of loose bark, which affords the pest hiding places. The rods should also be treated with a solution of 3 oz. of caustic soda and 3 oz. of commercial potash, dissolved in 2 gallons of boiling water. The fumigation with sulphur will not hurt the Vines if applied when they are dormant, unless it be done excessively. The XL-All Vaporising Insecticide might be used with advantage.

NAME OF SCALE INSECT: *Pinus.* *Orthezia insignis*, of Douglas. It belongs to the family Coccidæ, and is generally a very destructive species. Mr. E. E. Green, in the *Circular of the Royal Gardens, Ceylon*, s. 1, No. 10, pp. 83-94 (1899), has given a full and interesting account of this insect. You will also find a reference to the insect in *Bull. Roy. Gardens, Kew*, Nos. 102, 103, p. 163 (1895).

NAMES OF FRUIT: *B. G. S.* Summer Strawberry.—*Waterford.* 1, Lady Sudeley; 2, Stirling Castle; 3, Waltham Abbey; 4, Cellini Pippin; 5, Peasgood's Nonsuch.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so*

good as to consult the following number.—*D. R.* 1, *Silene gallica*; 2, *S. gallica* var. *quinquevulnera* (= *S. quinquevulnera*); 3, *Agrostis alba*.—*Learner.* 1, *Triticum repens*; 2, *Festuca sciuroides*; 3, *Agrostis vulgaris* var. *pumila*. *C. B.* 1, *Juniperus virginiana*; 2, *Cryptomeria japonica*; 3, *Cryptomeria japonica* var. *excelsa*; 4, *Juniperus*; 5, *Fraxinus*, Ash; 6, *Ulmus montana*.—*G. T.* 1, *Polygonum cuspidatum*; 2, *Polemonium cœruleum*; 3, *Galega officinalis alba*.—*E. B.* 1, *Asplenium Ruta muraria*; 2, *Asplenium trichomanes*.—*S. B.* 1, *Euonymus latifolius*; 2, *Salvia Horminum*.—*J. E.* *Bignonia radicans*.—*Mac.* *Aselepias curassavica*.—*D. Wallington.* We do not undertake to name varieties of Zonal Pelargoniums or other florists' flowers.—*No Name.* Address, St. Nicholas Men's Club. Another time please send better specimens, not more than six, carefully packed, and with the labels more easily detached. Our time is precious. 1, *Potentilla Tormentilla*; 2, 3 and 11 not found; 4, *Solanum*

FIG. 61.—ANTHRACNOSE (BLACK ROT) OF THE VINE.

Dulcamara; 5, *Achillea Millefolium*; 6, *Campanula rotundifolia*; 7, *Hypochaeris radicata*; 8, *Sagina procumbens*; 9, *Teucrium scorodonia*; 10, *Achillea Millefolium*; 12, *Calluna vulgaris*; 13, *Stachys Betonica*; 14, *Achillea Ptarmica*.—*A. G. C.* 1, *Spiraea ariæfolia*; 2, *Polygonum cuspidatum*; 3, *Rhus typhina*.—*Phyto.* 1, *Ulmus campestris* variety; 2, *Alnus glutinosa*.—*J. G. W.* Your specimens represent two of the very early raised kinds. 1 is near, if not actually *Venus de Medicis*; 2 is close to *Bank's Glory*; 3, a tuberous *Begonia*, which we cannot name.—*H. W. J.* 1, *Hedychium coronarium*; 2, *Tydea speciosa*; 3, *Cypripedium Sedeni*; 4, *Pteris cretica albo-lineata*; 5, *Pteris argyrea*; 6, *Adiantum decorum*; 7, *Asplenium bulbiferum*; 8, *Polypodium nigrescens*; 9, *Cyrtomium falcatum*; 10, *Cyrtomium falcatum*.—*H. W. J. and G. H. B.* It seems from internal evidence as if these ostensibly different persons were one and the same. If so, a shabby trick has been played upon us, the penalty for which is to send us forthwith a donation for the Gardeners' Orphan Fund. In one case ten specimens, in the other nine, instead of the regulation six. If we are mistaken we apologise.—*G. H. B.* 1, *Polypodium plumosum*; 2, *Gymnogramma ochracea*; 3, *Adiantum formosum*; 4, *Pteris serrulata polydactylon*; 5, *Adiantum capillus Veneris*; 6, *Pteris serrulata cristata*; 7, *Adiantum cardiochloena*; 8, *Gymnogramma tartarea*; 9, *Pteris longifolia*.

You have sent more than six.—*M. R. M.* *Cypripedium* × *Sedeni*, of gardens, more correctly *Selenipedium* × *Sedeni*.—*Greenlands.* 1, *Panax* or *Aralia*; 2, *Paullinia thalictrifolia*; 4, *Eleagnus pungens variegata*; 5, *Cornus mas* var. *tricolor*; 6, *Cassinia fulvida*.—*J. M.* 1, *Lycium sinense*; 2, *Sidalcea candida*; 3, *Pteris tremula*; 4, *Cystopteris fragilis*; 5, *Galega officinalis alba*; 6, *Robinia pseudo-acacia*.—*G. M.* *Equisetum arvense*. If weed-killer of eight times the usual strength will not kill it, we do not know what will! Try sprinkling it with petroleum and set it on fire, and dig up the roots.—*A. P. C.* Do not send more than six. *Veronicas* next week. 6, *Genista tinctoria*; 7, *Sedum spurium*; 8, *Genista sagittalis*; 9, *Sedum spurium album*; 10, *S. populifolium*; 11, *Olearia Haastii*; 12, *Potentilla fruticosa*; 13, *Colletia cruciata*.—*W. & S.* All varieties of *Statice sinuata*. *S. sinuata* was figured in *Botanical Magazine*, t. 71; and even at that early date it was a well-known plant. It is stated to be a native of Sicily, Palestine, and Africa.

NICOTIANA COLOSSEA: *M. B.* This is a species. We will endeavour to give you the information you require when less pressed.

ROOTS: *F. L.* We have not examined the root-cells in the cases you mention, but we expect they will turn out to be identical.

SCARLET RUNNERS: *M. Bros.* Due to the season. There is no fungus; the pods are perfectly healthy.

SITUATION IN JARDIN DES PLANTES, PARIS: *J. T. W.* Write to M. Gerome, the Curator. It is quite possible he may take you if your qualifications will satisfy him. As an alternative you may write to Mr. Geo. Schneider, who as President of the Société Française d'Horticulture de Londres, may be able to help you to get a situation in a French garden.

STRAWBERRY LEAF: *W. D.* The leaf is affected with the Strawberry fungus (*Sphaerella Fragariae*), figured in the *Gardeners' Chronicle* for July 8, 1891, p. 53. Spray the plants at once with a solution of copper, prepared by dissolving 3 oz. of carbonate of copper in one quart of water, and then diluting it to 20 gallons. If the pest is very bad, it will be well to remove all the old leaves early next spring and burn them.

THREE PEACHES: *F. H. B. & W. D.* The naming of Peaches is not possible, at least with certainty, and we would advise you to take them to some nurseryman who cultivates and fruits Peaches.

TOMATOS: *Padham.* There is no fungus disease present in the specimens sent us. The failure of the plants is probably due to some cultural defect, such as unsuitable loam, &c. If you will send portions of the roots we will examine them for signs of eelworm and wireworm.

TROPEOLUM SPECIOSUM: *F. E. G.* If you move the plant it will be best to do so in March, before growth commences; but there is risk in disturbing this species. You might take some of the growths from the underground rhizomes that are just appearing above the soil, and pot them up now. Be careful in severing them from the parent plant to save what roots there may be on the lesser rhizome, and place the plants in an unheated house or frame, where the plants may be shaded and kept moist until established. They should be planted-out next season when fully established.

COMMUNICATIONS RECEIVED.—*W. E. G.*—*A. H.*—*F. W. B.*—*S. W. R.*, Queensland—*Dr. Cogulaux*—*W. G. S.*—*R. L. C.*—*S. F. & Co.*—*W. C.*—*J. T. H.*—*M. C. C.*—*W. A. C.*, photographs—*R. L.*—*C. THE FLOWERING OF BAMBOOS.

SOME doubt has been expressed in recent issues from the Gardening press as to whether any Bamboos really die after flowering. The experience of the last few years in our own gardens has shown how unfounded was the belief at one time entertained that all Bamboos died after flowering. But it seems to be getting as far away from the facts of the case in the other direction to say that none do so. There appear to be three groups into which Bamboos may be divided, according to the way they behave after flowering:—1st. There are those which there appears to be no reasonable doubt die entirely; 2nd. Those that flower and bring themselves to a miserably crippled state by so doing, yet do not die; 3rd. Those that flower frequently but partially (that is on a certain proportion of culms only), and which do not appear to suffer at all. The following notes refer to species, both tender and hardy, that have flowered in these islands. In view of the points in dispute, it may be worth while to put on record their behaviour after doing so. The first two cases seem to me to prove that some Bamboos do not survive their flowering.

1. ARUNDINARIA FALCONERI.—I wrote to Mr. W. Osborne, late gardener to Lord Barrymore, Fota Island, respecting this Bamboo. It flowered there in 1876, and he says,—“All the Arundinaria (or Thamnocalamus) Falconeri at Fota Island, and all that I knew for miles round, bore seed and died at the same time. . . . We left the roots in the ground for a year or two, and then dug them up. There was not a particle of life in the roots.”

2. CHUSQUEA ABIETIFOLIA.—In the years 1884-1885, this climbing Bamboo flowered in the West Indies, and a plant sent to Kew from Jamaica flowered at the same time. According to Sir Daniel (then Mr.) Morris, “when the seed was set, the stem began to die down, and apparently every plant in the island [Jamaica] died, root and all.” (See *Gardeners' Chronicle*, Oct. 23, 1886, p. 524.) The Kew plant died also.

3. ARUNDINARIA HOOKERIANA.—This species flowered in the Temperate-house at Kew in 1899, and bore seed (from which the plants now in the house were raised). Every plant died; and Mr. Dallimore, at that time foreman of the house, informs me there was no sign of life in the roots when he dug them up. I learn, however, that at Glasnevin, where it flowered at the same time, some died whilst others have recovered.

4. ARUNDINARIA LAYDEKERI.—In 1896 this Bamboo flowered at Kew and in other establishments. As we had only one plant, I was anxious to keep it, and as it gave no sign of growth after flowering I had it taken up and placed in mild bottom-heat to stimulate it into activity again. It continued to send up new growths for more than a year, but after becoming a few inches high they invariably flowered, and the plant gradually dwindled away and died. Young plants were raised from seed at Batsford, but I do not know what happened to the original plant.

5. ARUNDINARIA SIMONI.—At intervals during the past twelve years this plant has blossomed at Kew. Never more than a few culms, however, have flowered at one time, and the plants have never suffered at all. From several quarters, however (Wales, Cornwall, and Surrey), I hear that it is flowering over every part of the plant this year, and in these instances it will be interesting to see what happens.

6. ARUNDINARIA AURICOMA flowers every year on a certain proportion of culms, but the plants remain as vigorous and healthy as ever.

7. ARUNDINARIA FALCATA VAR. GLOMERATA, growing in the Temperate-house at Kew, behaves like the preceding species.

8. PHYLLOSTACHYS HENONIS.—This Bamboo has flowered in many places throughout the country in recent years. So far as I know, none of the plants have died outright. Those that I have seen get into a very crippled, sickly state, but keep on sending out a few leafy shoots. They may ultimately recover.

9. PHYLLOSTACHYS NIGRA AND THE VARIETY PUNCTATA.—These, although distinct enough for horticultural purposes from P. Henonis, are really forms of the same species. Their behaviour after flowering is the same. *W. J. Bean, Kew.*

RAROTONGA.*

ONE by one the remote islands of the Pacific Ocean are becoming better known, and soon there will not be one unexplored on which there is endemic vegetation. But it is a singular fact in the history of these islands that some of those

of which the names are most familiar are or, until quite recently, were botanically unknown. Pitcairn Island, the refuge and home of the mutineers of the *Bounty* and their descendants, has still to be botanised in its least accessible parts, where endemic plants are likely to exist. It was the same with the Cook or Hervey Islands, the scene of the missionary Williams's remarkably successful labours early in the last century. This group has been a British Protectorate since 1888, and in 1900 it was fully incorporated in the British Empire. The following year Mr. Cheeseman spent the months of May, June, and July, botanising the island of Rarotonga, and although he does not claim to have exhaustively botanised it, there are probably few novelties left for future explorers. He presented a set of his dried plants to Kew, partly in order to have certain desirable comparisons made with specimens there; and he has now published the results of his investigations in the place cited below.

The island of Rarotonga is in about 160° W. long, within the tropics, and about six or seven hundred miles south-west of Tahiti. It is oblong in shape, and about eight miles long by six in width. The surface is very diversified and picturesque, with mountain ridges radiating from the centre, and a number of peaks from 1,500 to 2,250 feet high. The ridges are remarkably narrow and sharp, in places not more than a foot in width, with precipitous slopes into ravines hundreds of feet deep, and corresponding rivulets. The whole island is now practically covered with forest, though formerly nearly all practicable parts were cultivated. The climate is fairly equable, the temperature rarely rising above 90° Fahr., or falling below 60°; and the annual rainfall is about ninety inches. Thunderstorms, with a rainfall of two or three inches in a few hours, are not uncommon, but hurricanes are rare.

Mr. Williams estimated the population at 30,000 in 1823, or nearly ten times the present number.

Previous to Mr. Cheeseman's visit Kew possessed specimens of fewer than a dozen flowering plants from Rarotonga, and about as many Ferns. Now he enumerates 334 species of the two divisions, of which sixty-seven are Ferns. As might be expected, a large proportion of the species are generally dispersed in Polynesia, and many of them are of much wider distribution. Mr. Cheeseman eliminates ninety-nine as probably or certainly introduced, leaving an indigenous flora represented by 235 species.

The natural orders of the greatest number of species are: Gramineæ, 25; Leguminosæ, 23; Euphorbiaceæ, 16; Solanaceæ, 11; Compositæ, Rubiaceæ, and Malvaceæ, 10 each; Urticaceæ, Cyperaceæ, and Orchidaceæ, 9 each. Eighteen species, including one Fern, are apparently confined to the island. Prominent among these is *Fitchia speciosa*, an arborescent Composite, one of the commonest small trees in the island, forming the greater part of the forest in many places at elevations above 500 feet, and ascending to the tops of the highest peaks. It has glossy foliage, like a Laurel, and orange-red flower-heads 3 to 4 inches in diameter, and it is the most ornamental feature in the landscape. In the flowering season the natives make numerous excursions to the hills in order

* *The Flora of Rarotonga, the Chief Island of the Cook Group.* By Thomas F. Cheeseman, F.L.S., Curator of the Auckland Museum, New Zealand. *Transactions of the Linnean Society, Second Series (Botany)*, vi., pp. 261-313, plates 31-35.

to collect the honey which the flowers secrete in abundance. The genus *Fitchia* was previously only known from the Society Islands.

Sclerotheca viridiflora, a shrubby member of the Lobeliaceæ, is also interesting on account of the distribution of the genus being the same as that of *Fitchia*. All the Orchids found in the island are terrestrial, and belong to widely spread genera. The Coconut is the only Palm, and of this the natives distinguish five varieties, chiefly by the size and colour of the fruit. Bananas are still the staple article of food, and Mr. Cheeseman names fifteen varieties. Yams in variety, Taro (*Colocasia antiquorum*), Kape (*Alocasia macrorrhiza*), and Breadfruit are all extensively cultivated. There is a wild Banana (*Musa Fehi*) which bears an edible fruit, and often forms groves several acres in extent. The Pineapple is also largely cultivated, and the fruit exported to New Zealand. The five plates, by Miss M. Smith, illustrating this interesting addition to the literature of insular Floras, represent *Elæocarpus rarotongensis*, *Fitchia speciosa*, *Sclerotheca viridiflora*, *Myrsine Cheesemani*, and *Cyrtandra rarotongensis*. *W. Botting Hemsley*.

CUCUMBER MONSTROSITIES.

THE reputedly cool Cucumber has lately shown signs of great excitement. Last year we published some extraordinary cases of proliferation in a variety of Telegraph, and we now supply a figure of some Cucumbers in the fruiting stage. It will be seen from the drawing (fig. 62) that at the base of the older and thicker of the two fruits leaves are proceeding, and not only leaves but a second Cucumber on a short stalk, and, like the parent Cucumber, provided with leaves where ordinarily there are none. As the true fruit is embedded in a branch which forms the outer portion or rind of the Cucumber, it is not wonderful that such an axis should produce other branches. It is what a branch might be expected to do, but why it has done so in this case is a problem we cannot solve.

NEW OR NOTEWORTHY PLANTS.

RUBUS LASIOSTYLUS, FOCKE.*

To Messrs. James Veitch & Sons, of Chelsea, we are indebted for a specimen of this handsome Chinese Bramble, remarkable for its glaucous stem, leaves covered with white down on the lower surface, purple flowers, and rose-pink "berries," resembling those of a Raspberry, but sub-globose. It was introduced from China by Dr. Henry, and is noteworthy for its glaucous cylindrical branches, provided with rather numerous slender straight or slightly-curved prickles. The leaves are trifoliate on long prickly petioles; stipules large, leafy, obliquely oblong, abruptly acuminate. The terminal leaflet in the specimen examined was about 4 inches long, rather less in extreme breadth, thin in texture, light green and hairy above, downy and milk-white beneath, ordate suborbicular acuminate bidentate, nerves pinnate-approximate, with transverse inosculating nervules; the lateral leaflets are similar but much smaller. The flowers are numerous, in much-branched panicles, provided with large leafy stipule-like bracts and remote prickles. Flowers nearly 1 inch across, with broadly lanceolate acuminate purplish sepals, hairy on the inner surface; petals rosy-purple, oblong, shortly stalked, shorter than the sepals; filaments glabrous. Fruit sub-globose, pointed; ovaries or

drupels rose-pink, covered with hairs and terminating in long styles. Flesh yellow; flavour peculiar, not unpleasant, subacid, reminding one of the taste of the berries of the Hawthorn, or, as a friend states, something between a Raspberry and a Blackberry.

The species is well worth growing by the plant-lover, and affords a promising subject for the cross-breeder. *M. T. M.*

ORCHID NOTES AND GLEANINGS.

DISA GRANDIFLORA.

SOUTH African terrestrial Orchids, even in our best collections, often refuse to respond to the care bestowed on them in a satisfactory manner; on the other hand, in some gardens, most of them

FIG. 62.—LATERAL PROLIFERATION IN A CUCUMBER.

thrive admirably, and especially that showiest of all—*Disa grandiflora*. In Mrs. Brightwen's pretty gardens at The Grove, Stanmore, Mr. J. W. Odell has seemingly without effort cultivated every species of Cape terrestrial Orchid which has come into his hands. Among them are several species of *Satyrium*, which have flowered regularly for years; the frail and pretty *Disa sagittalis*, which also flowers regularly; *D. tripetaloides*, with several elegant spikes of white rose-spotted flowers to each plant; *D. racemosa*, and some of the hybrid *Disas*, and, best of all, a number of *D. grandiflora*, with stout spikes of large bright scarlet flowers. Mr. Odell winters them on a shelf near the glass in a cool greenhouse, where they remain until the flowering season is over, when they are placed in a cold frame situated in a shady place, the glass-lights of which are off for the greater part of the time. Here they remain until winter sets in. *Disas* like a free

supply of rain-water and a pure and rather dry air around them, hence they seldom thrive in an Orchid-house.

ANGULOA UNIFLORA VAR. EBURNEA.

Anguloa uniflora, upon which the genus was founded by the Spanish botanists Ruiz and Pavon, is the most widely distributed member of the genus, having been found in extreme localities in Peru, New Granada, and other parts of South America, and is, perhaps, consequently the most varied in form and even in the colouring of its flowers. The bulk of the species, however, from all localities have, compared with the showier members of the genus, rather narrow, laterally compressed flowers with acute sepals, sometimes bluish white or pale pink, and often spotted with rose. Occasionally, however, there appears a large pure white form with almost globular flowers so much resembling those of the largest *Anguloa*, the yellow *A. Clowesii*, as to have acquired for it the erroneous name of *Anguloa Clowesii* var. *eburnea*. The form of the column and of the labellum of this large white variety is very different from those of *A. Clowesii*, and the plant, which has also been called *A. eburnea*, was correctly figured from a specimen which flowered with Sir Trevor Lawrence, Bart., in *Lindenia*, viii., p. 27, as *A. uniflora* var. *eburnea*. A similar large, pure white, wax-like variety, with a rose-coloured freckling inside the labellum, is kindly sent by H. Rider Haggard, Esq., Ditchingham House, Norfolk, who makes his garden his chief pastime when not engaged on the literary work which has brought him so much fame. Mr. Rider Haggard states that he received the plant as "a new species from the Philippines," but there must have been an error in the record, for the plant could scarcely be indigenous in that region.

GOMEZA PLANIFOLIA.

A raceme of twenty-five flowers of this pretty and delightfully fragrant species is sent by Francis H. Moore, Esq., the Royal Infirmary, Liverpool, who states that it came from Brazil with *Oncidium concolor*. It was introduced by Messrs. Loddiges about the year 1822, and has frequently appeared since. It is a compact-growing plant of the light green tint seen in Miltonias, with which it thrives well. Its floral racemes are freely produced, the flowers being greenish-yellow, the lip light yellow, the column white with a reddish line round the stigmatic surface. A singular feature is given by the broadly-oblong lip of the mature flower resting closely on the longer lateral sepals, which are united for two-thirds of their length. *J. O'B.*

MARKET NOTES.

LATE PEACHES.

A VISIT to Mr. J. Walker's market garden at Ham Common, Kingston, interests me at any time, and more especially at this season, when the Peach crop is a small one. The fruits observed were large and of high colour, and even the fruits of Princess of Wales Peach were very highly coloured. The Peach-houses are now without artificial heat, so as not to hasten the ripening of the fruits.

I have put a double asterisk in my note-book against Sea Eagle, for never have I observed this variety of so large a size or with such fine colour. I had this variety under my charge at Worthing, some thirty years ago, growing it in pots and in the border. I well know its value. Nectarine Peach was of full size and good in other respects, and the trees cropped very regularly. Princess of Wales is always a good-sized fruit, but it is generally of a pale tint; here, on the contrary, the tint is very beautiful.

Gladstone, an extraordinary fruit in all respects, was excellent. There were five trees in one house

* *Rubus lasiostylus*, Focke, ex *Botanical Magazine*, t. 7426 (1894).

NOTICES OF BOOKS.

THE TREE BOOK. By Mary Rowles Jarvis. (John Lane).

THIS is a dainty little book, consisting apparently of reprints of magazine articles. In any case, it is pleasantly if not authoritatively written. The author's statements indeed require to be received with caution. It is very doubtful whether the Elm is a true native of this country, a doubt recognised by the author, though on the same

The second flower is named Lady Muriel Digby, and is of great size. The general colour is primrose, with a yellow stain and markings of crimson. It was shown by Messrs. Kelway & Son, the celebrated cultivators in Somersetshire, from whom we received only a day or two ago specimens of several other remarkable novelties, as follows:—Admiral Markham, red flaked with deeper colour, and marked with purple on the lower segment and throat; Duke of Norfolk, 5½ inches across, colour salmon-red, with a white band through each segment and a

alone. This variety, Mr. Walker told me, is always better if the ripening is aided by fire-heat. Crimson fruits of Galande from some of the trees have been gathered, and there were later fruits to follow. Trees of the new Peach Thomas Rivers, a very strong grower, were fruiting abundantly—a late and very promising variety.

The Barrington Peach is one of the choicest and richest in colour, and large of size, cropping well. Humboldt Nectarine is a very large fruit of the Pine-apple breed and a good variety for market. The methods of packing fruit for the

FIG. 63.—TWO NOVELTIES IN GLADIOLI THAT RECEIVED AWARDS OF MERIT AT A MEETING OF THE ROYAL HORTICULTURAL SOCIETY ON AUGUST 18.

market afforded a useful lesson, everything being graded as packed, and needless to say the best prices are obtained. Stephen Castle.

GLADIOLUS.

At the present time, when every garden is, or should be, gay with Gladiolus in bloom, the accompanying illustration (fig. 63) of two bold and beautiful varieties exhibited at the Drill Hall meeting on August 18 last will have especial interest. The first one, Nymph, is pure white, except for a stain of yellow on the lower segment, and a disc of dark colour at the base of the open throat. It will be seen that the flower is of large size, composed of rounded segments. This variety was shown by Mr. W. C. Bull, Rathlin, Ramsgate.

white mark on the lower one; Snowdrift, white with stain of pale buff colour on the two lower segments and a purple blotch in centre, conspicuous violet-coloured anthers; Countess Amy, purple with white band in centre of each segment; Moyana, cream-coloured with markings of rose in centre, and deeper shades of cream; and Taunton Deane, salmon-red colour, of duller shade than Duke of Norfolk, and flaked with a deeper tint; the lower segment has a white blotch minutely spotted with deep red colour.

All these varieties have exceedingly large flowers; and the size and strength of the spikes—most of which were developing two smaller spikes, in addition to carrying from twenty to thirty flowers—are an indication of the extraordinary success that attends the cultivation of this bold and handsome autumn-flowering plant at Langport.

page she speaks of four varieties as "indigenous." We should not consider the Elm as specially valuable for town-planting, but rather the reverse, unless in parks and large open spaces.

The "Willow" upon which the captive Hebrews hung their harps is quite as likely to have been the Euphrates Poplar, Populus euphratica. A printer's error has converted the name of the Elder from Sambucus nigra to Tambuscus Nigra. The "keys" of the Ash and Maple are not seeds. But we need not dwell on these minor matters; the author's powers of observation are manifest in her remarks about the fertilisation of the flowers, and in her remarks on the supernumerary buds of the Gueldres Rose, Viburnum Opulus, in the axils of the leaves of which we are told there are three buds, "one to grow and the others as reserves to be called up if needed." The work ends with a

section in which the reader is told how to distinguish the trees; but what is meant when we are told that the fruit of the Oak is "acorns, rough cup and smooth elongated bulb," we cannot divine. The book is provided with an index, and the illustrations are pretty and characteristic.

THE FLORA OF JERSEY.

Mr. Lester-Garland has published, through Messrs. West, Newman & Co., a "Flora of the Island of Jersey," which we can commend to all visitors to that favoured spot. It opens with an

Lester-Garland is that of Engler; hence this is, so far as we know, the first Flora of any part of Britain arranged on that system. The old group of Monochlamydeæ disappears entirely, its members being sorted into their proper places according to their real affinities. No experienced botanist will regret this change, though as an avowedly artificial group it had its advantages in facilitating research. No classification can be perfect; our knowledge is and will always be too imperfect to enable us to trace definitely the genealogy of living plants, and hence the value of an artificial system as a kind of index, a means to an end but

THE BOOK OF SHRUBS.

By George Gordon, V.M.H.

This is one of the series edited by Mr. Harry Roberts, and published by John Lane. There is still a sad want of knowledge of ornamental trees and shrubs amongst the owners of gardens, or perhaps even a more deplorable apathy on the subject. Landscape gardeners are often unaware of the resources at their command, and thus, as the demand is slight, it is only in a few of the large nurseries that we find a stock of any but the commonest things. Yet a visit to Kew or to some of the exceptional nurseries alluded to will suffice to reveal beauty and interest among trees and shrubs quite comparable with the endowments of any other class of plants. From Japan and China we are receiving additions to this department, and, thanks in especial to the discoveries of Dr. Henry and Mr. Wilson, not to mention earlier collectors, and to the energy and zeal of Messrs. Veitch, we may expect a steady influx of new and beautiful plants of this nature. There may be some of our readers who saw the extraordinarily numerous and varied collection of Chinese plants exhibited at one of the meetings of the Royal Horticultural Society this spring by Messrs. Veitch; and if that collection did not whet their interest and rouse their curiosity, the case must be more hopeless than we think it really is. The exhibits in spring of flowering shrubs shown by Messrs. Waterer, Veitch, W. Paul, G. Paul & Son, Cheal, Fisher, Son & Sibray, and others, are also amply sufficient to show what a wealth of beauty is at command. For the most part the trees are hardy and of the easiest possible culture. Mr. Gordon has done good service by calling attention to them first in a series of articles in the *Gardeners' Magazine*, and now in the little volume before us.

After a few judicious remarks on transplanting and cultivation, the author enumerates many of the more showy deciduous species, beginning with those that have A as the initial letter of their names, and ending with Weigela. American shrubs, shrubs with ornamental foliage, trees and evergreens, Conifers and Bamboos, all come in for mention, but it is obvious that in the compass of some eighty pages the treatment of the subject must be so far from exhaustive that we may hope at no distant time to be put in possession of that more complete work which is one of the requirements of Garden literature.

THE CUCUMBER SCAB.

(CLADOSPORIUM SCABIES.)

In the issue of the *Gardeners' Chronicle* for August 8, p. 100, a description was given of a new disease known as Cucumber Scab, which it is feared will prove to be an exceedingly hurtful scourge. As every detail in connection with this new pest is of importance until its life-history is ascertained, it must be recorded that since we have discovered that the convex and blackened cuticle is not an essential feature, we have also found that after the infected fruits have been kept undisturbed for twenty-four hours, the cut and broken surfaces, where the fruit has been broken across, and all exposed portions of the flesh, have developed a crop of the characteristic mould, which appears to grow vigorously, at once, from every fragment of the fruit. From this we may infer that the mycelium thoroughly permeates the fruit, and that every fragment of infected Cucumbers should be burnt at once, because millions of the conidia may be developed and ready for dissemination in little more than a day and night. In the illustration at fig. 64 the sporules are magnified about 400 diameters, and their dimensions are 10×8 by 12×8 , reaching to 20 to 25×8 m. (micromillimetres). M. C. Cooke.

FIG. 64.—CUCUMBER SCAB (*CLADOSPORIUM SCABIES*, Cooke).

Fruit real size; threads and sporules magnified 400.

account of the physical features of the island, where summer merges into autumn, and autumn into winter; where severe frosts are unusual and snow seldom lies long on the ground. Thirteen frosty days and 1930 hours of sunshine in the year are quoted on the average of fifty years. Cider was once the chief article of export, but Earth-Apples, or Potatoes, have taken the place of the Apples on the trees. Cultivation, drainage, and the erection of residences have done much to reduce the indigenous flora, which is dispersed over six different kinds of station, viz., the sandy beaches in the vicinity of the sea, the granite cliffs, the salt marshes, the moorlands, the cultivated table-land, and the moist valleys and meadows. The arrangement followed by Mr.

not the end itself. The systematic enumeration of Jersey plants follows the introductory chapter, and not only are the Jersey localities given, but also indications are furnished of the existence of the species in the other Channel Isles, in western France, and Europe generally. We do not find any special mention of the relationship between the flora of the Channel Islands and that of the south-western parts of England and Ireland. Attention is called to the very interesting fact that many Mediterranean species have made their way up the coasts of Spain and France to Jersey, which thus forms the northern limit of several of these plants. The book is evidently very carefully compiled, well printed, and provided with an index of genera.

THE APPLE CROPS AND CYDER-MAKING IN DEVONSHIRE.

At a time when the Apple crops over the country are much under the average, and the quality for the most part inferior, it is distressing to know that even in the notable Apple counties of Devon, Hereford, Somerset, Worcester, and Gloucester, the same state of things prevails. This fact is all the more regrettable since in these counties Apples are not only the fruit upon which so many of the poorer classes depend for domestic use in the winter, but they are equally or perhaps more important for the production of the staple drink, cyder. Much attention has of late been directed towards the extension of the trade, making this a profitable industry by improvement in methods of manufacture and by selection and cultivation of the best kinds of cyder Apples. The revival of an old industry of this kind has a considerable interest, especially as it has been allowed to fall into disrepute in consequence of the questionable methods adopted in the preparation of the beverage as well as in the material from which it is often made. One sees, for instance, in a good Apple season quantities of the fruit gathered and collected in heaps in the orchards that abound in this neighbourhood, the heaps being untouched until late in autumn or early in the winter months, and when removed in the ordinary farm carts the fruits are in such a state of decay as to suggest their use for manure rather than for making a wholesome drink. It is with the view of altering this, and using the fruits just at the time when they are fully ripe or "mellow," as well as in the adoption of a thoroughly clean and healthful system of manufacture, that cyder-making is now occupying the minds of the authorities in this country. Under proper supervision the neglected orchards will, it is hoped, be improved and become more remunerative, so that in good seasons in the future the Apple orchards of Devon may be as productive of healthy, well-grown trees as that shown in the photograph (fig. 65), for which I am indebted to Messrs. Henry Whiteway & Co., of Whimple, near Exeter, who are taking a lead in the cyder industry of Devon.

It is, perhaps, scarcely necessary to say that the photograph does not give an idea of what the orchards hereabout appeared like in the past spring, when flowers were not only scarce, but what there were were spoilt by late frosts, with the result that at the present time there is scarcely an Apple to be seen in any of the orchards in this neighbourhood. *John R. Jackson, Claremont, Lympstone, Devon.*

CULTURAL MEMORANDA.

TABERNÆMONTANA CORONARIA.

This free-growing stove plant produces pearly-white flowers from the points of the young growths during the summer months. Cuttings of 2 to 3 inches in length, taken off any time in the year and inserted in small pots filled with sandy soil, placed in a forcing-house or pit and afforded water, will root in due time. The rooted cuttings should be potted singly into 72-size pots in fine peat, with a sprinkling of sand added, making this moderately firm about the roots in potting; return to heat and afford water. When the new growth has grown a few inches nip off the points, and repeat this operation until bushy plants of the desired size are obtained, these being shifted into larger pots before the roots become matted until placed in their flowering-pots, which may range from 8 to 10 inches in diameter. In potting employ good turfy peat, with the addition of small

nodules of charcoal and some silver sand. The plant will succeed with ordinary stove treatment; the soil being kept uniformly moist at the roots, and the plants clean. *H. W. Ward.*

WATSONIA IRIDIFOLIA O'BRIENII.

A bed of this fine snow-white Irid is in fine condition in the open ground in the quarters devoted to Lily culture in the nursery of Mr. H. A. Tracy, Amyand Park Road, Twickenham, who stated that up to this season he, like many others, has had but indifferent success with it. Formerly he used to pot the bulbs in the spring,

from the points of the individual young shoots during July and early part of August. These being borne well above the dark-green narrow lanceolate serrated leaves, are very telling in effect, and command the attention and admiration of all who see the plants in flower; therefore I cannot help wondering why this charming *Spiræa* is not better known and more extensively grown than it appears to be. The plant is admirably adapted for planting singly on lawns, alongside shrubby walks, or, indeed, in any position where plenty of light and sunshine can reach it; moreover, it is a capital plant to cut from, as the flowers keep

FIG. 65.—AN EXCELLENT CYDER APPLE TREE IN DEVONSHIRE.

and although they made fine foliage they did not flower satisfactorily. This season the bulbs, which were also rather small, were kept dry in the bulb-shed until the first week in June, when they were planted in a bed in the open ground. They started into growth at once, and were afforded water copiously until they all, without exception, sent up flower-spikes. They were then given weak liquid manure occasionally, and the spikes became very strong and branched freely, showing flowers in great profusion. *J. O'B.*

SPIRÆA ANTHONY WATERER.

Anthony Waterer is one of the best, if not the very best, of the shrubby *Spiræas*. It is a profuse flowerer, producing as it does good-sized trusses

fresh a long time in a cut state. A good stock of this showy and very useful shrubby plant may be easily worked up from cuttings taken early in September, or earlier, and inserted in 48-size pots, duly crocked, and filled with light mould, and surfaced with silver-sand, stood in a cold-frame, watered through a rose, and kept close and shaded from bright sunshine for a fortnight or so, will soon form root and leaf-growth, when the little plants should be potted singly in small pots, returned to the frame, and watered, keeping the frame close until the roots have taken to the new soil, the plants being then subjected to a free circulation of fresh air, preparatory to planting them out-of-doors in the spring. *H. W. W.*

REMARKS ON THE CONDITIONS OF THE FRUIT CROPS.

(See Tables, ante, pp. 72-77.)

(Continued from p. 153.)

WILTSHIRE.—The Apple, Pear, Plum, and Cherry crops were almost totally destroyed by the severe weather we had between April 8 and 25 with scarcely a break. The severest frosts occurred on the 17th, 18th, 20th, 23rd, 24th, and 25th, when we experienced from 7° to 12° of frost on each night. The only crops saved were those against walls protected by glass copings and netting suspended in front. *T. Challis, The Gardens, Wilton House, near Salisbury.*

— Apples, Pears, and Plums are a general failure here, owing to the hard frost of April. Morello Cherries, Strawberries, Currants, and Gooseberries turned out better than was anticipated. *S. W. Tucker, Longford Castle Gardens, Salisbury.*

LANCASHIRE.—The fruit crops were never so bad in this district. Every fruit, except Strawberries, failed in consequence of late frosts. That of 6° on the morning of June 21 finished the work of destruction; Peas, French Beans, Potatoes, and other tender plants were either much injured or killed outright. On July 6 we were visited by a gale of wind from the west charged with salt spray brought a distance of 20 miles, which proved as disastrous as the frost to many subjects; even the foliage of forest-trees looked as if they had been subject to 10° of frost. *Wm. P. Roberts, Cuerden Hall Gardens, Preston.*

CORNWALL.—The cold weather we had in the months of March and April destroyed most of the blossom, and punished the wall-trees more than I have known for a number of years. All wall fruits are very scarce, and the Apple-crop is almost a failure. *W. H. Bennett, Menabilly, Par Station.*

— We had a magnificent show of blossom on all fruit trees, but the spring frosts were disastrous. Apples, Pears, Peaches, and Apricots are utter failures, despite the dry June—we only had 1.10 inches of rain. Strawberries have been remarkably fine and very good in flavour. Figs promise to be a very good crop. Peach blister was prevalent, but the trees have now outgrown it, and in common with all fruit trees are growing well. *A. C. Bartlett, Pentarrow Gardens, Washaway, R.S.O.*

DEVONSHIRE.—With one or two exceptions the fruit crop is a failure. The autumn of last year was wet and cold, and unfavourable for fruit trees. Pears and Apples blossomed very well, and I attribute the loss of crops to the unripened state of the wood. *Geo. Baker, Membland Gardens, Plymouth.*

— Apples, Pears and Plums are not nearly so plentiful as last year, but what there are appear to be clean and good. The sharp frosts experienced during April worked havoc with Cherries and Pears, and though Apricots appeared to set all right, and Cherries too, a great number have dropped during the stoning period. Peaches and Nectarines are good, and Raspberries have been abundant; also Strawberries, Gooseberries, and Red Currants. Cider prospects are far from good, last year's making being sold at 50s. a hogshead of 63 gallons. In some years it can be bought for half that price. *James Mayne, Bicton Gardens, East Budleigh.*

GLOUCESTERSHIRE.—During the sixteen years that I have resided in this locality I have not seen so poor a crop of fruit. The only redeeming feature is a sprinkling of Apples, of which the varieties Worcester Pearmain, Blenheim Orange, and Cox's Orange Pippins are the best. *Geo. W. Marsh, St. George's Nursery, Cheltenham.*

— The severe frosts of April, such as 9°, 10°, 11°, and as low as 20° of frost! destroyed all prospects of much fruit of any kind. We have no Pears or Plums, and very few Apples. *William Keen, Bowden Hall Gardens, Gloucester.*

HEREFORDSHIRE.—Taken all round, the fruit-crop is the worst we have experienced for many years. Apples and Plums are a very small crop; Pears, Cherries, and Black Currants almost a total failure. Other small fruits not good, Gooseberries only turning out fairly well on account of their having matured fruits from a second crop of blossoms, the first time I have ever known this. The damage was caused by three days' very severe frost, which cut off everything, even blossom-huds not showing colour. *John Watkins, Pomona Farm, near Hereford.*

— The only Apple carrying a good crop is Stirling Castle; and of Pears, Durondeau and Marie Louise d'Uocle are the best. Apricots are a total failure. Strawberries were a good crop, especially the variety Laxton's Fillbasket. *Thos. Spencer, Goodrich Court Gardens, Ross.*

MONMOUTHSHIRE.—In these gardens the only variety of Apples carrying a heavy crop is Golden Summer Pippin, which, owing to its position, escaped injury during the April frosts. In many orchards the caterpillars of the Winter-moth have again been most destructive. Peaches and Nectarines are very good, and the trees are clean and healthy. *W. F. Wood, Llanfrefchu Grange Gardens, Caerleon.*

— Few Apples, except some cider varieties, carry fair crops, and Warner's King, Frogmore Prolific, Lane's Prince Albert, The Queen, Cellini Pippin, Lord Grosvenor, and Grenadier as bush trees carry light crops. Pears are almost a total failure, except some trees upon walls that were protected in spring by canvas blinds. Similar remarks apply to Plums. There is, however, a light sprinkling of fruit upon some bush trees, Victoria being the best. Cherries, with the exception of Morellos, are a complete failure; and Peaches and Nectarines are thin. *T. Coomber, The Hendre Gardens, Monmouth.*

SOMERSETSHIRE.—The worst crop I have experienced in thirty years. Splendid show till the frost in April; but even now we have fared better than many. Gooseberries, Strawberries, and Morello Cherries were good. Apricots have suffered in wood to a large degree. We have not 100 Pears in our garden, and not a sack of Apples. *John Crook, Forde Abbey Gardens, Chard.*

WORCESTERSHIRE.—There is little or no fruit of the staple kinds. Here and there a few orchards, or rather plantations, of Pershore Plums have cropped moderately. There are several notable exceptions in Apples, Court Pendu Plat (the "Wise" Apple, properly called, as the trees of this variety never bloom till all danger of frost is over); Stirling Castle (a regular cropper every season—truly this old Apple should be planted extensively); Schoolmaster, The Queen, Professor, and Pott's Seedling—this latter bears also every season. *A. Young, Witley Court Gardens, Stourport.*

— Apples are very thin; Lord Grosvenor, Worcester Pearmain, The Queen, and Lane's Prince Albert are the best. Several Peach-trees have been almost killed by frost, although partially protected. *F. Jordan, Impney Gardens, Droitwich.*

— The summary of the fruit crops on all sides is that one has to record the most disastrous all-round failure of a life experience. The only spark of consolation is that the causes were beyond human control, with comparatively few exceptions. Pears are a complete failure in the open, and there is only a sprinkling on best walls. It is now an established fact that no fruit blossom can stand from 6° to 14° of frost for ten nights in succession without serious injury. On

some of the above nights there were as much as 6° of frost at 10 P.M., increasing to 14°—indeed, quite thick ice was formed during several nights, consequently the tender fertilising organs of the buds and flowers were completely frozen through and utterly destroyed. This happened in the middle of April, following upon the heels of a mild winter and early spring. *W. Crump, Madresfield Court Gardens, Malvern.*

WALES.

CARNARVONSHIRE.—The most unsatisfactory for forty years.—*W. Speed, Penrhyn Castle Gardens, Bangor.*

PEMBROKESHIRE.—A few of the hardiest Apples have escaped, notably King of the Pippins and Winter Hawthornden. Such fruits as Gooseberries and Currants, which very rarely fail, were a short crop this season. *George Griffin, Slebeck Park Gardens, Haverfordwest.*

(To be concluded.)

The Week's Work.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maldenhead.

Peach and Nectarine-trees.—When the fruits have been gathered from early varieties, cut away all wood that has carried fruit this season that will not be required for extending the trees. The sun's rays, which are necessary to mature the wood, will then be more likely to reach all parts of the trees. Aphids are especially troublesome this season on the points of the shoots, and can best be destroyed by dipping the ends into a vessel containing one of the approved insecticides. Do not permit the leaves to shade fruits that are ripening; and if birds and wasps are troublesome, cover the trees with fine-meshed netting.

The Apricot.—The few fruits that escaped the May frosts and got safely through the "stoning" period have cracked badly, and are useless for dessert purposes. Remove the laterals and sub-laterals before they have made much growth, and secure the leading growths to the wall, for the wood being very brittle it is easily broken by gales.

Hints on General Work.—Finish the planting of Strawberries, so that they may become established before winter. Autumn-fruiting varieties have suffered from the heavy rains and low temperature. Where the plants are growing on a south or west border it is good practice to afford them the protection of a cold frame; but abundance of air must be afforded during fine weather by tilting the lights sideways. Remove all runners that have formed lately upon the plants in the open, and keep the Dutch hoe going between the plants during fine weather. Morello Cherries are now ripe, and if well protected from the wasps and birds will keep in good condition on the trees for several weeks. When fruit is required look over all the trees and gather the most forward.

THE FLOWER GARDEN.

By J. C. TALLACK, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

Late Tulips.—All the later-flowering kinds of Tulips, such as the "Darwin," "Cottage," "English," "Parrot," also varieties of *T. Gesneriana*, and most of the true species require to be planted earlier than the ordinary Dutch forms, because they need a longer season for root-growth. Bulbs, therefore, which were lifted a few weeks ago and dried under cover, as advised, should now have the outer scales rubbed off (especially if these are not bright in appearance, but show signs of fungoid spotting), and when they have been sorted into sizes, they should be replanted. Do not throw away the small bulbs, but plant them by themselves, that they may develop into flowering bulbs. By keeping a supply from such young stock vigorous growth may be maintained in the collection. If the soil is inclined to be heavy and unsuited to Tulip-culture, it may be much improved by a heavy dressing of river-sand or road-grit, and if at all poor good rotten manure and

leaf-mould may be dug in deep enough to be well below the bulbs when planted. Insert the bulbs thickly enough to enable the plants to support each other, and at the same time not to be overcrowded. No general rule can be given for this, as the leaf-growth varies greatly according to the variety. From 4 inches to 6 inches deep will be sufficient, choosing the latter depth where the soil is light. *T. Greigii*, *T. Clusiana*, *T. persica*, and *T. Sprengeri*, &c., appear to prefer a comparatively sheltered position on the rockery rather than a place in the open.

Alliums.—Among the Alliums are several very handsome species, perhaps the best-known of which are *A. moly*, very suitable for planting in warm soil in a sunny position; and *A. neapolitanum*, an excellent plant for naturalising in the shade of trees. *A. Ostrowskianum* is an excellent plant for the rockery; and another good species to plant is *A. pedemontanum*. Alliums are somewhat neglected, and the present being a good time for planting, this note may be useful in drawing attention to them.

Alpines.—In Alpine gardens and rockeries many species are planted which are certain to succumb if the winter be very wet. At this time of the year small pieces of the various Saxifrages, Sempervivums, &c., may be readily rooted in shallow boxes containing gritty soil, and, if kept in a dry frame during the winter, will be useful to replace any established clumps that may fail. *Saxifraga pyramidalis* especially, and some others, will not winter out here unless planted so that snow cannot lodge on them. Take slips or cuttings of such as these now; and it is a good time to raise stock generally.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bicton, Budleigh Salterton, Devonshire.

Greenhouse Climbers.—*Tecomas*, *Bignonias*, *Passifloras*, *Tacsonias*, *Cobæa scandens*, and *Mandevilla suaveolens* usually make so much growth during the summer months that it becomes injurious to plants growing beneath them unless it is occasionally thinned out. This will be the more necessary now that the days are getting shorter, therefore cut the growth away freely with a knife wherever it is at all crowded. *Heliotropes* that appear untidy may be spurred fairly close back, and will then flower again about Christmas if afforded a little fire-heat early in November, or as soon as frost or excessive damp renders it desirable. Do not syringe *Lapagerias* that are developing blooms. *Bougainvillea glabra* and *B. Sanderi*, trained near the glass roof in the orangery here, are making a good show now, but the former is much brighter and the flowers larger than those of *B. Sanderi*, consequently the older variety is preferred. Plants of *Luculia gratissima* or *Pincana* growing in beds or borders, and now setting their flower-heads, should be kept drier overhead for a time, and if there be any thrips the leaves had better be sponged with soapy water.

Ferns.—Plants in small pots may be transferred to larger ones if it is intended to keep them growing. If it is found necessary to sow each autumn to maintain a stock for thumb-pots, select fertile fronds now; but where plenty of ventilation is afforded a fernery, there are generally sufficient seedlings to be found among the shingle or other staging material. Lay the fronds with spores on sheets of paper, cover them, and place them on a shelf until the spores are ripe, when they may be sown in small shallow pans filled with a peaty, sandy soil, made firm and covered with sheets of glass. When germination has taken place, remove the glass, and as soon as the young plants are ready, prick them off into other pans and keep them near to the glass. The sun's rays being less powerful now, gradually reduce the shading, especially in the case of *Adiantum cuneatum* grown for cutting purposes.

Campanula pyramidalis remains a very long time in flower if kept in an airy structure, free from overhead moisture, and its perfume is of the sweetest. Any old plants that may not have flowered should be transferred into pots a couple of inches larger, to make good plants for flowering next summer. Seedlings raised this year should

be fit for 8-inch pots, and may be afforded a similar soil to that recommended for *Richardias* three weeks since. Place the plants in full sunshine, and lay the pots on their sides during heavy storms. This is necessary in the case of all newly-potted plants standing in the open, and to such greenhouse plants as *Azaleas*, *Ericas*, *Camellias*, &c.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury.

Miltonia Roezlii M. Blevana.—These plants are rather uncertain in their flowering season, and often when they are healthy and vigorous they produce two displays of flower in one year; but there is little doubt that those produced during April and May are by far the best. At Westonbirt the plants afforded a good display at that season, and when the flower-spikes had been removed, the plants which are cultivated in a leaf-soil compost, were kept rather dry at the roots until new growths began to push. These growths are now commencing to make new roots, any repotting therefore that is necessary may be given attention. Their culture should be very similar to that afforded *M. vexillaria*, except that they need more heat, and should be placed in a shady corner of the warmest house. The plants give better results when the roots are confined, over-potting should therefore be avoided.

Masdevallias.—The robust-growing species succeed best in the cool-house, where they are now fast completing their growth and making new roots freely from the base. When these are visible the plants may be repotted or topdressed without delay. The compost should contain leaf-soil, this being one of the many species that thrive admirably in it. Use therefore equal parts of rough leaves, turfy-peat, and fresh sphagnum-moss, and add plenty of sand. Press this moderately firm about the roots of the plants, and cover the surface with a neat layer of clean moss. Avoid over-potting, and make sure that perfect drainage is supplied each pot. The most critical time for these plants is that following the potting process, before the roots have secured a good hold of the compost. It is then most easy to over water them, and thus lose many leaves. The material should be in a moist condition when it is used, so that some time will elapse before the plants will need to be afforded more, which should be a thorough soaking. The plants will also need a little extra shade for a time; but when they are re-established, let them be placed close up to the light so that newly-made leaves may mature. As the days become shorter much less water will suffice, it being safest to keep them on the dry side during winter.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PIGOTT, Bart., Wexham Park, Slough.

Celery.—The earliest Celery should be well blanched and fit for use. Afford later plantings attention, that a good succession may be maintained. No watering need be done at present, owing to recent rains. Remove side-shoots and all decayed leaves, and when the plants are quite dry draw small quantities of earth around them, making it as fine as possible, and remembering that much soil should not be applied at one time, nor on any account should soil be placed above the hearts of the plants. The latest batch for use in March and April will not require to be earthed until October or November, but the plants should be looked over carefully, removing all offsets, and keeping the surface-soil well stirred with the Dutch-hoe. Dust the plants in the early morning with fresh soot.

Cardoons, like Celery, should be blanched by degrees. Place a few inches of stiff brown paper round each stem first, following this up with hay-bands, and finally banking-up the soil about them. Choose fine days for the work, when the plants will be quite dry.

Mushrooms.—When sufficient material has been got together and sweetened by frequent turnings and exposure to the air, beds should be made in the Mushroom-house to afford successional crops. Let the beds be made to a depth of 2 feet or 2 feet 6 inches. Tread and beat the manure with

a wooden rammer as the building-up proceeds, for it is essential that the manure be made as firm as possible. Do not spawn the bed until the heat is declining to about 80°. Break the spawn into pieces as large as a turkey's egg, and put the pieces into holes 3 inches deep made with the hand at distances of 9 inches. Cover the spawn with manure taken from the holes, pressing it back very firmly. Defer soiling the bed for a week, and in the meantime place over it a thin covering of long stable-litter or straw. The atmosphere of the house should be cool and moist, avoiding fire-heat.

Tomatos.—The season has not been a good one for Tomatos out-of-doors. Expose the fruits to the sun and air as much as possible by keeping the plants free of all growth, and remove or cut back some of the leaves. Cut the fruits as soon as they show signs of colouring, and place them in a warm position indoors, where they will finish ripening.

Beans.—See that Runner Beans are securely staked against strong winds by placing extra-supports to keep them in an upright position. Trim the loose growth away with the shears after it has reached the top of the stakes. Gather the pods when they are of moderate size, or they will become unfit for use. French Beans sown in pits and frames should have the points of their growth pinched back to the seed-leaf as early as possible to induce them to branch. Make another sowing in pots or heated pits.

FRUITS UNDER GLASS.

By T. H. C.

Peaches and Nectarines.—If the trees intended for forcing very early next season were forced last season, they will need no encouragement to rest at the proper time provided previous instructions in regard to ventilation have been carried out, and the trees were partially pruned after gathering the fruit. Do all that is possible to retain the foliage clean and healthy until it ripens naturally. It is important at this stage that the trees shall not suffer from a lack of water at the roots; much of the evil of bud-dropping in the early months of the year is due to a deficiency of root-moisture at this season. Thoroughly wash with the hose or syringe the foliage upon trees from which the fruit has recently been gathered. Thin out the shoots that will not be required for fruiting next season or for extending the trees, and throw the ventilators wide open, or, if possible, remove the roof-lights altogether. If the trees have borne an exhaustive crop, afford them liquid-manure or other approved fertiliser. Expose the fruits on later trees to the sunshine, and syringe the trees in the morning and afternoon until the fruits are approaching ripeness.

Unheated Houses.—Houses containing late varieties of the Peach and Nectarine should be closed early in the afternoon that the sun-heat may be preserved, which will aid the ripening of the fruits, and mature the wood that will fruit next year. Open them again a little top and bottom in the evening to dispel superfluous moisture. Tie the shoots in thinly over the trellis, so that light and air may freely circulate among them. Remove all extra strong-growing and sappy shoots. When watering, liquid-manure may be afforded aged and heavily cropped trees, but clear water only should be given to young trees. Forcible syringings with clear water will keep down red-spider, and if mildew is troublesome, dust the affected parts with flowers-of-sulphur, removing and burning any fruits that are badly affected.

Tomatos.—If not already done, pot on into well-drained clean 6-inch pots Tomatos for winter fruiting, employing a compost consisting of three parts good fibrous loam, and one part leaf-mould, adding a small quantity of charred garden refuse, mortar-rubble, and a sprinkling of "Veltha" Powder. Make the soil moderately firm, and if possible place the plants thinly upon a base of ashes in a pit close up to the roof-glass. Encourage a sturdy short-jointed growth by free ventilation in fine weather, but in dull and sunless weather maintain a slight heat in the hot-water pipes. Put a stake to each plant, and grow on as cordons, rubbing out the side-shoots as soon as they form.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, SEPT. 9—Royal Caledonian Horticultural Society's Show in Waverley Market, Edinburgh (two days).
York Dahlia Show.

SATURDAY, SEPT. 12—Royal Botanic Society Meet.

SALES FOR THE WEEK.

MONDAY to FRIDAY, SEPT. 7 to SEPT. 11—Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10³⁰ o'clock.

THURSDAY NEXT—The whole of the plants at Cuckoo Hall Nursery, Cuckoo Hall Lane, Lower Edmonton, by Protheroe & Morris, at 12 o'clock.

FRIDAY NEXT—Orchids in variety, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—60.7.

ACTUAL TEMPERATURES:—

LONDON.—Sept. 2 (6 P.M.): Max. 84°; Min. 59°.

Sept. 3.—Fine, warm. 79°.

PROVINCES.—Sept. 2 (6 P.M.): Max. 78°, North of Scotland; Min. 50°, Home Counties.

By the aid of long experience and persistent effort, horticulturists may fairly claim to have made two blades of grass grow where one only grew before; moreover, the "grass" is of better quality. We get it earlier, we gather it in later. The advantages we have thus derived from improved methods, more rigorous selection, and better opportunities do but enable us to foresee the infinitely greater benefits that we or our immediate successors may derive from the application to practice of the lessons of science. As cultivators our concern is with the living plant. The more we know of the way in which the plant lives and of the manner in which it carries out its life's work, the fuller our knowledge of the conditions and limitations under which these operations are carried on, the greater will be our success as practical men. Ordinary routine work well carried on ensures a large measure of success, but it affords no hope of advancement, no chance of breaking new ground, no power of adapting ourselves to unforeseen conditions, or availing ourselves of the ore which men of science are constantly bringing to the surface for us to utilise.

If these remarks appear transcendental and unpractical we have but to turn to the achievements of science in other departments to be convinced that similar results are within our reach also. Wireless telegraphy, the penetration of otherwise opaque substances by certain light rays, are only two illustrations of the way in which scientific discovery, at first regarded as unpractical, has rapidly been utilised for the great benefit of humanity. Considerations of this nature led us to welcome the proposal that emanated from Professor BEACH, that an attempt should be made to organise scientific work in relation to horticultural practice. From some letters addressed to us by Professor BEACH we are gratified to find that his proposal has already

been cordially welcomed in the United States. Matters of this kind are not confined to one nation, but they concern all humanity, and hence, whilst, on the ground of patriotism, we might have been pleased if such a movement had originated in the Old Country, we can but rejoice that it has been well taken up in the New. Our cousins have forged ahead of us in this matter, the means at their disposal are larger and more varied than any we enjoy; their experiment stations, their colleges, the organisation of their Government Agricultural Department are all in advance of anything we can show in the same line.

We have in mind more especially the educational facilities enjoyed in the United States and in Germany, and the abundant opportunities afforded for research in those countries. We do not for one moment overlook what has been done and what is doing at Kew and at Rothamsted. We have every reason to be proud of those establishments as unsurpassed in their way, but their work lies upon such different lines that they are above and beyond comparison.

Professor BEACH, who is the "Horticulturist" of the New York Agricultural Station at Geneva, N.Y., writes to us as follows:—

"While the need of better organisation of scientific work along horticultural lines has been felt in this country for some time, I was quite unprepared for so enthusiastic and generally favourable a reception as the proposition met with. I enclose a copy of the circular letter announcing that organisation has been determined on.

"While we American horticulturists are endeavouring to take a step forward in the organisation of our scientific work, we do not forget our indebtedness to the mother country. How different would be the aspect of both the art and the science in these United States had we never had the assistance of English gardeners, and had Kew never existed!"

"The organisation of the Society for Horticultural Science proposed in my circular letter of June 30 has been decided on. The proposition met with a wide and enthusiastic and almost unanimously favourable reception among not only horticulturists, but also a considerable number of botanists and other scientists. The need of the Society is keenly felt, and the time appears ripe for inaugurating the new movement. An attendance of at least thirty of those interested is assured for the Boston meeting, and Professor L. H. BAILEY has consented to preside at the first meeting.

"The circular letter has elicited various and often divergent expressions of opinion as to the organisation, affiliation and policy of the Society, especially as to its affiliation. In order that the whole subject may be gone over thoroughly and deliberately, a preliminary meeting for organisation and conference will be held in the rooms of the Massachusetts Horticultural Society, Wednesday afternoon, September 9, at two o'clock. It is hoped to have the fullest possible attendance at this meeting. The headquarters of the Society will be the same as those of the American Pomological Society."

We hope to be able to record the results later on.

"THE BOTANICAL MAGAZINE."—Mr. W. B. HEMSLEY, F.R.S., Keeper of the Herbarium of the Royal Gardens, Kew, is now associated with Sir JOSEPH HOOKER in the editorship of this periodical. A more appropriate appointment could not have been made.

MR. W. B. LATHAM.—A meeting of Nurserymen, Gardeners, and others interested in horticulture was held on Saturday, August 22, to consider the best means of recognising the many years of valuable service rendered to horticulture by Mr. W. B. LATHAM, who is resigning the curatorship of the Botanical Gardens, Edghaston, and at that meeting it was unanimously resolved to entertain him at a Complimentary Dinner, to be held at the Colonnade Hotel, New Street, Birmingham, on Thursday evening, September 24, and in the meantime to raise a fund for the purpose of presenting him with a Testimonial suitable to the occasion, and such that will represent the good wishes of all lovers of horticulture in Birmingham and district. In addition to having held the curatorship for thirty-five years, he has been Chairman of the Birmingham Chrysanthemum Society for thirty years, of the Gardeners' Association for seventeen years, and of the Birmingham Spring Flower Show (at one time held in the Town Hall) for fifteen years, thus establishing a unique record of useful activity in the interest of horticulture. Mr. J. HUGHES, High Street, Harborne, is the Hon. Sec.

NOVELTIES FROM QUEDLINBURG.—We have received from Mr. ROEMER, of Quedlinburg, Germany, a plant of *Begonia semperflorens* Golden King. It is described as a variegated sport of the darkest *Begonia semperflorens* Zulu King, that was introduced in the autumn of 1897. The plants of this novelty, as grown under glass, are of a stout and regular bushy habit, and branch freely. The leaves are very small, round, upright, and bright sulphur-yellow coloured, marked sometimes with spots or blotches of an orange colour. The nerves or veins of the leaves are sometimes of the same yellow colour, but at other times of a lively green colour. The flowers are rich crimson, and the seed-pods crimson-red. When this *Begonia* is planted out the yellow colour becomes bright carmine or carmine-rose on the margin of the leaves. Mr. ROEMER states: "All the other yellow-leaved varieties of *B. semperflorens*, such as *B. semperflorens atropurea foliis aureis*, and also of *Begonia semperflorens* Golden Ball, are less attractive than Golden King, and the flowers of Golden Queen are deeper in colour."

A VARIEGATED HELIANTHUS.—Mr. ROEMER also sends us a plant of a variegated *Helianthus*, of which he states "most of the plants of *Harpalum rigidum foliis aureis*, or *Helianthus rigidus foliis aureis*, are about 5 feet in height. They are vigorous in habit and branch freely. The rough leaves are bright sulphur-yellow coloured, sometimes variegated with green. The flowers are of good size and of a darker colour than the leaves. I dare say there are few perennials that have such bright foliage, and I am sure it will be found valuable for planting in groups or in beds; but single plants will also be very effective. The plants are perfectly hardy and have withstood several winters with me in the open ground without any protection or covering. Last year about 50 per cent. of the seedlings came true from seed.

DR. AUGUSTINE HENRY.—Scientific circles have been rejoiced by the return to London of this genial and accomplished man, a native of Ireland, who went out to China, and has now retired from the Chinese Customs after a service of twenty years. He is a distinguished botanist and ethnologist, and delivered two lectures in the Cork Exhibition, on Wednesday evening, August 26, at 8.30, on "Primitive Folk of China"; and on Thursday evening, August 27, on "Forests, Wild and Cultivated." Dr. HENRY, who is an accomplished and interesting speaker, has the art of using his learning lightly. He has enriched the Herbarium at Kew with many thousands of plants, a large proportion previously unrecorded, and has contributed many articles to these columns

on Chinese plants. He has also made a special study of the characteristics and usages of the singular and thrifty people among whom he spent some of the most active years of his life. The lectures above alluded to were illustrated with slides from Dr. HENRY'S valuable photographs. Having, while in China, been impressed by the forests there and the choice wood-craft, or rather wood-working, thrift and skill of the Chinese, Dr. HENRY has taken up forestry as a special study, and has inspected some of the best-managed forests, not only in Great Britain and Ireland, but also on the Continent, and in tropical regions as well. Quite recently a visit to the sandy Landes of France, where *Pinus maritima* (*Pinaster*) has succeeded so well, convinced him that much good work of a similar kind, viz., the reclamation and planting of waste and barren tracts of land, might be profitably carried out elsewhere, especially in Ireland. He is at present assisting in the production of a sumptuous work on trees, the inception of a well-known traveller and scientific naturalist, who has seen trees and forests, wild and cultivated, in nearly every part of the world. Dr. HENRY is still in the prime of life, his energy and enthusiasm are alike remarkable, and he will carry with him in his new spheres of labour the good wishes, not alone of his many personal friends, but of all interested in forestry, ethnology, botany, and the political economy of our native land. F. W. B.

THE ICELAND POPPY.—Messrs. STORRIE & STORRIE, of Dundee, have kindly sent us a few flowers of a peculiarly fascinating strain of this lovely Poppy, the flowers of which present delightful combinations in colour-shades, particularly of yellow, orange, rose, and red. Some of them are flaked similar to those shown at the Holland House show on June 25, when the strain was distinguished by an Award of Merit.

THE NEW FROGMORE.—A correspondent writes:—"There is going on in the Royal gardens at Frogmore a process of change or evolution that bids fair to make not only a new but a vastly improved Frogmore. As rapidly as a big staff of men under Messrs. MACKENZIE & MONCUR, of Edinburgh, can perform the work, all the old glass structures are being cleared away, and in their place are being erected lofty and broad vineries, Peach, Fig, and other houses, running east and west of the entrance which fronts Mr. MACKELLAR'S residence. On the west side the houses vary a little in breadth; on the east side they will be all three-quarter spans, and more lofty. Fronting these will be borders and a broad walk; in front, a long glass corridor, from the south side of which will radiate a series of span plant, Melon, Cucumber, and other houses. Two huge boilers will furnish the heat required, and the whole of the hot-water pipe mains will be laid in a series of deep, broad, brick subways, now being constructed, so that all repairs or other needful attention can be given without opening the ground. The splendid bothies have already been described and illustrated in these pages. That the change or evolution thus being effected was needed there can be no doubt; still it is but what we are entitled to look for in the gardens of the King of Great Britain, where all should be of the very best. It is something on those lines we hope in time to see evolved out of the new Chiswick at Wisley, where a bold designer and an able gardener, such as Frogmore has, might create a grand garden worthy of the horticulture of Great Britain."

FIRST GARDEN CITY.—It would appear that this scheme has taken definite shape, and that operations will shortly be commenced in the laying out of some 4,000 acres of land near to Hitchin, on the Great Northern line from King's Cross. The site is near the railway junction at Hitchin, and the land is stated to be all that

could be desired for the mixed purposes of residential, factory, and agricultural operations. Water, the promoters state, is found in abundance, and there are various roads over the property, which is now in the hands of a strong firm prepared to do all that is necessary for the formation of the first Garden City.

THE "BELVEDERE."—Quite recently a very ornamental annual plant, about 2 feet in height, of dense pyramidal habit, light green linear leaves turning eventually to purple, was exhibited by Messrs. CANNELL, and attracted much attention, as suitable for bedding and other decorative purposes. It was soon recognised as a Chenopod or Goosefoot, known to botanists as *Kochia scoparia*, but long cultivated in gardens, though now almost forgotten, so that we failed to find any references to it in NICHOLSON'S Dictionary. Turning over MILLER'S *Gardeners' Dictionary* (eighth edition, 1768), we came across the following account of the plant, which we deem of sufficient interest to quote:—

["CHENOPODIUM (SCOPARIA).—Goosefoot with a hairy Flax-leaf, commonly called Belvedere, or Summer Cypress.]

"The third sort is sometimes cultivated in gardens; it is a beautiful plant, which is naturally disposed to grow very close and thick, and in as regular a pyramid as if cut by art. The leaves are of a pleasant green; and were it not for that, it hath so much the appearance of a Cypress-tree that at some distance it might be taken for the same by good judges. The seeds should be sown in autumn; and in the spring, when the plants are come up, they may be planted into pots of good earth, and kept supplied with water in dry weather: these pots may be intermixed with other plants to adorn court-yards, &c., where they will appear very handsome, until their seeds begin to swell and grow heavy, which weigh down and displace the branches; at which time the pots should be removed to some abject part of the garden, to perfect their seeds, which if permitted to fall upon the ground will come up the next spring, so that you need be at no more trouble in propagating these plants, but only to transplant them where you intend they should grow."

The plant is an annual, and a native of Central and Southern Europe. It is the *Chenopodium Scoparia* of LINNÆUS, and derived its name from "scopæ," meaning thin branches suitable for making brooms; or from "scoparius," a sweeper. By some it has been identified with the "scopa regia" of PLINY (Book xxi., cap. vi.), "*Non levior est, quam scopam regiam appellant; quanquam folia ejus olent, non flores.*" Here a comparison is made with the perfume of "Caltha"; but whilst it is the flowers of *Caltha* which are fragrant, it is the leaves of the *Scopa regia* which have that property. The identification of the *Scopa regia* of PLINY with *Kochia Scoparia* of modern botanists seems very doubtful, for although the dried twigs might serve for a light broom, the leaves are destitute of fragrance, or have a slight weedy odour which is scarcely agreeable. LINNÆUS, as it will be noticed, wrote the specific name with a capital S, and was at no pains to make the generic and specific names of the same gender, whence it is to be inferred that *Scoparia* was originally used as the name of a genus. Someone who has leisure at command might probably light on the name in some old herbal; we have looked in vain in GERARD and CHADRAEUS. The *Scoparia dulcis* of LINNÆUS is a totally different thing.

THE LONDON DAHLIA UNION.—We are informed that, owing to the closing of the Royal Aquarium, Westminster, the annual display of Dahlias made by the Union, which comprises all the leading Dahlia-raisers and cultivators of the day, will take place in the Prince's Hall of the Earl's Court Exhibition, which is near the entrance in the Warwick Road, on Wednesday and Thursday, September 16 and 17. It is during this particular week that the popular Cactus Dahlia is seen at its best, and on this occasion there will be on view not only all the finest new varieties of the present year, but several from abroad, including some very singular and interesting variations of the

type, of home and foreign production. As the Dahlia show will form a part of the General Exhibition it is free to all who pass the gates, and the flower-loving public will have an opportunity of witnessing one of the largest exhibitions of all types of the Dahlia ever seen in London. The Secretary and Manager is Mr. RICHARD DEAN, V.M.H., Ealing, London, W.

"THE OFFICIAL HANDBOOK TO THE PUBLIC PARKS OF LEEDS AND KIRKSTALL ABBEY."—This guide, by ARTHUR T. ALLSOP, Parks Superintendent, is superior to most books of its class, and certainly deals with details of a city deserving of carefully-written descriptions. The open spaces seem to be kept up on the wise principle that a park should be a park, and a playground a playground; and that sports and games are important adjuncts, as well as museums and schools. Judging by the letterpress and the many illustrations, Mr. ALLSOP manages an important task with much skill. In his Handbook he mentions the various parks and recreation-grounds about Leeds, telling us something of the bird-life therein, while we read also of the attractions of Woodhouse Moor and Ridge, and of Kirkstall Abbey, and various other interesting places near Leeds. In connection with all, we must remember the difficulties attendant upon all horticultural operations when carried on in the vicinity of a large and crowded city.

ANOMOTHECA CRUENTA.—This pretty little Irid is a native of the Cape of Good Hope, whence it was introduced long ago; but up to the present time we were not aware that it had any claims to be considered a hardy plant. Captain ROGERS, however, has sent us from Plymouth a drawing of the plant, which he tells us has come up regularly for the last three years in his stable-yard, near the root of a Plum-tree, and in a situation where it gets no benefit from the morning sun, and indeed only a scanty supply of sunlight for the rest of the day.

"HOLIDAYS IN NORTH GERMANY."—The publishers (for the Great Eastern Railway) send us, from 30, Fleet Street, a tempting handbook, edited by PERCY LINDLEY, and telling us about holidays in North Germany. Greatly increased facilities now exist for visiting Berlin and the interesting old towns of Brunswick, Hanover, Hildesheim, &c., combined with the picturesque Hartz Mountains district. The route recommended is the much-advertised one *via* the Hook of Holland, and is certainly direct and convenient.

OLD-TIME NAMES.—Mr. DIVERS sends us some extracts from a seed-list of 1710, in which mention is made of "Dutch Admirals, Hottspur Beans, Belvedere Double Larksheel, Wing Pease, and Cardus," and asks us to say to what varieties these names severally apply. We do not know what Dutch Admirals are. Perhaps some of our correspondents can help us in this matter. Hottspur Peas are mentioned in Miller's *Gardeners' Dictionary*. Belvedere is none other than *Kochia scoparia*, recently re-introduced, but known in MILLER'S time as Summer Cypress. Larksheel is synonymous with Larkspur. The winged Pea *Pisum* (*Ochrus*) is described as having an entire leaf, sending out tendrils. *Cardus* (? *Carduus* or ? *Cardoons*), we cannot find the name. It may be interesting to quote the names of the Peas given in the eighth edition of MILLER'S book, dated 1768, the first in which the Linnean nomenclature was adopted, and therefore a book of very great interest. Here are the names of the Peas:—The Golden Hottspur, the Charlton, the Reading Hottspur, Masters' Hottspur, Essex Hottspur, the Dwarf Pea, the Sugar Pea, Spanish Morotto (*sic*), Nonpareil, Sugar Dwarf Sicklo Pea, Marrow Fat, Dwarf Marrow Fat, Rose or Crown Pea, Koucival Pea, Gray Pea, and Pig Pea. It is interesting also to note that the Crown

Pea, then called *Pisum umbellatum*, was grown in these times; indeed, it is described and figured in Gerard's *Herbal* (1597), under the title of Tufted or Scotch Pease, long before the silly story got afloat that this was obtained from an Egyptian mummy-case, whence the name Mummy Pea, under which name we generally get some specimens every year. The appearance is due to a fasciation or blending of several stalks into one ribbon-like stem, surmounted by a "crown" of flowers and pods at the top.

CROYDON HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—On the 26th ult. about thirty members visited Burford Lodge, and through the kindness of Sir TREVOR LAWRENCE

Tea, J. B. Carruthers.—*Report on the Trivandrum Museum and Public Gardens, 1901-1902.* The season was not unfavourable for the plants; the number of these was greatly increased.—*West Indian Bulletin*, vol. iv., No. 2. Contents: Ground-nuts in the West Indies, W. G. Freeman; Cultivation of Pine-apples, Bay Oil, and Bay Rum, Culture and Uses of Eucalyptus, &c.

DAHLIAS.

Now that Dahlias are to the fore, we have the opportunity once again of figuring the very beautiful *D. imperialis*, or Tree-Dahlia. This attains such a height that it is only in establishments provided with lofty structures that it has room to develop. Indeed, the last time we saw it, it had to be laid low to exhibit its attractive lilac

FIG. 66.—DAHLIA IMPERIALIS, GROWING IN QUEENSTOWN, CAPE COLONY.

the party was shown round the gardens by Mr. BAIN, the head gardener. In the afternoon Albury Park, the residence of His Grace the Duke of NORTHUMBERLAND, was the rendezvous, and an inspection was made of the spacious gardens and pleasure-grounds. Fine weather was experienced throughout the day. This was the fourth annual outing.

PUBLICATIONS RECEIVED.—*Bulletin du Jardin Impérial Botanique de St. Petersburg*, Tome III., Livraison 5, Michigan State Agricultural College Experiment Station Horticultural Department—*Vegetables and Bush Fruits*, by L. B. Taft and M. L. Dean.—*Agricultural Bulletin of the Straits and Federated Malay Straits*, June. Edited by H. N. Ridley. The contributions to this periodical relate chiefly to the cultivation and extraction of rubber.—*Circulars and Agricultural Journal of the Royal Botanic Gardens, Ceylon*, January: The Tea Tortrix; April: Report by the Controller of the Experiment Station, Peradeniya, Herbert Wright; May: The Lobster Caterpillar, E. E. Green; July: Root Disease in

flowers. The specimen we now figure (fig. 66) is growing in the Botanic Garden, Queenstown, Cape Colony, and we are indebted to the Secretary, Mr. F. Bernick, for the illustration. The plant was figured in our columns on April 2, 1870, p. 459. It may be added that Queenstown is in 32° S. lat., and has an elevation of 3,500 feet above the sea, which is over 100 miles distant.

In our SUPPLEMENTARY ILLUSTRATION the garden Dahlia is represented by one of the newer varieties of the "Cactus"-flowered type. "Cheals' White" has thin, long, narrow florets, which incurve towards the centre, a characteristic that has been described as "claw-like," and being of moderate size, it is a very good specimen of the Cactus Dahlia. Some remarks upon the judging of this type will be found on p. 181, in the report of a lecture delivered at the Drill Hall.

KEW NOTES.

IMPATIENS OLIVERI.—This is a new introduction from Uganda which we owe to Sir John Kirk, who collected seeds of it in that country, and sent them to Kew with the following particulars:—"Impatiens, found 390 miles inland up railway; altitude 6,800 feet in volcanic rock or tufa; stems erect, fleshy, 4 feet high; flowers white, grows in clumps." The plants now flowering at Kew have stems 2 feet high, branched from the base, the leaves in whorls, oblanceolate, 3 to 6 inches long, the margins clothed with bristle-like cilia; flowers several on a slender pedicel 3 to 4 inches long, of the same form as those of *I. Sultani*, but 2½ inches across, and of a clear blush-pink colour paling to white in the centre; spur 2 inches long, white. This is perhaps the largest-flowered of all the Impatiens, and promises to be a first-class garden plant. It grows freely in a cold house, and may prove hardy enough to be grown out-of-doors in summer.

CAMPTOSEMA RUBICUNDUM.

The genus *Camptosema* attracted some attention a few years ago, when *C. grandiflorum* was introduced from Brazil. We grew that plant in a stove at Kew, but it was never satisfactory. A much better garden plant is *C. rubicundum*, also a native of South America, but perfectly happy in a greenhouse along with *Tacsonia van Volkemi*, where it grows along a rafter and produces *Wistaria*-like racemes of bright ruby-red flowers. Fifty years ago it was grown in the Palm-house at Kew, where it formed "a climbing shrub of great length; the older portions of the stem as thick as one's finger, the young leafy branches slender; leaves trifoliate, dark green." It was introduced into cultivation under the name of *Kennedyia splendens*, and was said to be from New Holland. It is a very suitable plant for covering verandahs, &c., in subtropical countries, and also for pillars in warm greenhouses.

OLDENBERGIA ARBUSCULA.

A plant of this remarkable Composite has been in flower for some weeks in the Cape-house at Kew, where it has grown in sixteen years from a seed to an erect, thick-stemmed, unbranched shrub 3 feet high, with felted leaves like those of *Eriobotrya*, but shorter, and a large head of purplish flowers. In some notes of Cape plants published in the *Gardeners' Chronicle* in 1887, I gave the following particulars of this plant:—It is common on the hills about Grahamstown, being largest and healthiest on the highest and most exposed hills, where there is little soil. From a few seeds brought home by me we have raised plants. Although a free and abundant flowerer, its great heads (often a foot across, and composed of a mass of purple flowers) being plentiful enough, yet it is only rarely that seeds are ripened. I believe this is the first time this plant has been flowered in Europe, although it has been in cultivation before. It is totally unlike any other Composite in cultivation. In Grahamstown it forms a shrub something like *Rhododendron Falconeri*. A figure of it will shortly be published in the *Botanical Magazine*.

KLEINIA GALPINI.

Although introduced from the Transvaal to Kew in 1890, and described in the *Botanical Magazine* in 1892 (t. 7,239), this really attractive-greenhouse plant has not yet received much notice. There is a group of it now in flower in the Cape-house at Kew, where its succulent silvery foliage, bright orange-coloured flower-heads, and compact habit give it quite a distinct and ornamental appearance. It is easily grown, can be propagated from leaf-cuttings, and it flowers freely. In a summer like the present it

would not perhaps be a first-class plant as a bedder, but in a sunny clime I have no doubt that it would form a large, cushion-like mass of silvery foliage, studded over with bright orange flower-heads. It is the handsomest of all the species of *Kleinia*, a genus peculiar to Africa, and although for a time merged in *Senecio*, now again restored by Kew.

ORCHIDS.

The following are specially noteworthy as being in flower at Kew: *Habenaria carnea*, an excep-

HOME CORRESPONDENCE.

HELP REQUIRED.—Will you permit me through your columns to solicit the support and interest of anyone who has influence with the Governors of the Royal Hospital for Incurables, Putney, on behalf of James R. Green, formerly a gardener, but who has been totally paralysed for the last nine years? This case is strongly recommended by Mr. H. Veitch, Mr. Ingram, also by Dr. Wilson of Weybridge, and Captain G. A. Webbe. I should be glad to receive any promises of votes. The Gardeners' Royal Benevolent Society, through

LATE-FLOWERING APPLES.—Some years ago I crossed Court Pendu Plat with some pollen from Wyken Pippin, and as a result I got several seedlings, only one of which is of any use. This is a very good-flavoured Apple, similar in appearance to but larger than Wyken Pippin, and is, I think, likely to prove a good late-keeping dessert fruit. It retains in a marked degree the late-blooming qualities of the parent. I have this season sent grafts to one of our leading fruit-tree specialists for trial, and have also worked some myself on the Broad-leaf and Nonsuch Paradise stocks for trial. *W. E. Wallace, The Nurseries, Eaton Bray, Dunstable.*

FIG. 67.—A GROUP OF LATE-FLOWERED HIPPEASTRUMS EXHIBITED AT THE SHREWSBURY SHOW BY CAPTAIN HOLFORD, WESTONBIRT, TETBURY, GR., MR. A. CHAPMAN. (SEE ANTE, P. 146.)

tionally good example; *Bulbophyllum grandiflorum*, with seven large bird-like flowers; *B. mandibulare*, *B. barbigerum*, *B. saltatorium*; *Megaclinium platyrachis*, the most remarkable species of a very peculiar genus; *M. angustum*; *Angraecum Eichlerianum*, with about twenty large white flowers, which have been open about two months and are still fresh; *Dipodium pictum*; *Neobenthamia gracilis*, which has the appearance of a Bamboo, and terminal clusters of white flowers suggestive of *Hoya carnosae*; *Stenoglottis longifolia*, a most useful Orchid, easily grown and nearly always in flower, its erect elegant racemes of bright purple flowers being of the kind that florists find valuable for bouquets, &c. The white form of it is also in flower. *W. W.*

its Committee, has rendered valuable help to this candidate. The Benevolent Society deserves all the help we gardeners can give it. I hope to be again able to organise a concert on its behalf, and would be glad of the help of any one living within reasonable distance of Chertsey. The concert will be early in November. *A. J. Brown, School of Handicrafts, Chertsey.*

POLYGALA VULGARIS, WHITE VARIETY, ETC.—On the 22nd inst., while out botanising, I found a pure white specimen of *Polygala vulgaris*, the Milkwort. Will you kindly inform me whether this is a rarity or not? [It is not common. *Ed.*] I also found pure white specimens of *Ballota nigra* (or perhaps *B. alba*, *Benth.* and *Hook.*), and *Prunella vulgaris*. *Rockcist, Penarth, S. Wales.*

— Your correspondent refers to a matter of some moment to British fruit-growers—one, moreover, greatly accentuated in this terribly trying year. Not only are they to be commiserated on their present and periodical losses owing to the vicissitudes of our climate, but also on account of the adverse criticism to which they are so constantly subjected. Anything that can be done to improve the prospects of home growers is well worthy the attention of your correspondent and all well-wishers. My chief object in sending you this communication is to suggest that not only should an attempt be made to increase the varieties of late-flowering Apples and all other hardy fruits, but also of those particular but limited number of varieties which are prone to carry crops year by year, as a very exceptional few really do. *1*

will confine these remarks to Apples, and instance such varieties as the too little known variety Golden Spire, which always crops, and with me is as good this year as in other years. It is a thin-branched, wiry-habited tree, with insignificant flowers, which it seems to set in all weathers. Bismarck again is a fairly free setter, though very different in matter of flowers, foliage, and habit. It is fruiting here this season, notwithstanding Keswick Codlin is quite bare. Then there are Potts' Seedling, Margil, &c., which are likely subjects to work upon in this direction, always bearing in mind that the pollen parent most generally influences intercrosses. *William Earley.*

— Mr. Edward Hobday's suggestion in relation to the desirability of obtaining a race of late-flowering Apples is interesting, although it may not result in securing for Apple bloom immunity from frost. The first thing to ascertain from all who grow Court Pendu Plat is how far the bloom of that variety may have escaped frost and is now producing fruit. In all the gardens I have been into, in not one case has that variety been pointed out to me as specially fruiting. Do not let us forget that the early flowering of Apple-trees, as of all others, this year was largely due to the exceptionally warm weather we had early in the year. But for that fruit-bloom would have been a fortnight later. But I find not a few observers who do not attribute all the present fruitlessness to the frosts. They think that last season's ungenerous weather is largely the cause of comparative bloom weakness or pollen deficiency. If that be so, we cannot have very high hopes for a fruit crop next year. A. D. [Several of our correspondents have referred appreciatively to this variety in their remarks upon the fruit crops. Instances appear on p. 174. Ed.]

— The interesting note of Mr. Edward Hobday has set me looking over my note-book, in which I have from time to time recorded the cropping of those varieties which have come under my observation in various home counties. In addition to seeing these varieties growing, the majority are also on the market. Mr. Gladstone, Juneating (both white and red), and Beauty of Bath; Quarrenden, Duchess, Favourite, Cox's Orange, King of the Pippins, very heavy crop, but hanging badly. Culinary: Keswick Codling (heavy crop), Lord Suffield, Golden Spire, Stirling Castle (heavy crop), Worcester Pearmain, Cellini, Manx Codling, Ecklinville, Blenheim Orange, Prince Albert (Lane), Dumelow's Seedling (Wellington), and Hawthornden (new). Some of these, as recently as August 29, at Worthing, I saw hanging in full crop. At Twickenham (Orleans House) there is a very full crop of Wellingtons, &c. At Finchley, Stirling Castle is particularly heavy. At Brentford, King of the Pippins is extra good. As good Apples come into the market I learn the district from which they are grown. Worcester Pearmain, is good from Canterbury. *Stephen Castle.*

A BIG PRICE FOR POTATOS.—We have sold to a speculating buyer 2 tons of Northern Star for £317, and he has already refused £400 for them. It is turning out all that is claimed for it, being a strong grower, an abundant cropper, of good quality, and free from disease. It is expected that this Potato will make £400 a ton before Christmas. There are plenty of buyers, but few sellers. *Horne & Sons, Cliffe, Rochester.*

SPECIFIC NAMES.—If your correspondent will refer to the note by the Rev. C. Wolley-Dod in the *Gardeners' Chronicle* for August 8 last, he will find that the suppression of the initial capital to a personal adjective in the Kew *Hand-Lists* is not "a specimen of carelessness in compilation or in proof-reading," but was deliberately adopted, and is described by Mr. Wolley-Dod as "logical and consistent." Roylei, Novæ-Zelandiæ, and Moldavica are all substantives, the latter being the name of a suppressed genus. The imputation in a widely-circulated journal of "carelessness" in the preparation of works issued from a public establishment is a serious matter, unless it can be clearly justified by facts; and this, it appears to me, your correspondent has not succeeded in doing. *W. T. Thiselton-Dyer.*

— I may perhaps be allowed to say that Mr. Batson, and not Sir W. Thiselton-Dyer, seems to me to have misunderstood the question at issue. I am sorry if I stated the case obscurely in my first letter to the *Gardeners' Chronicle* on the subject. The innovation to which I called attention, with an expression of entire approval, referred only to adjectives derived from personal names when used as botanical specific names. These have hitherto been written with an initial capital letter; but in the last edition of the Kew *Hand-Lists* they are written with an initial small letter, as geographical adjectives have always been. No change is made in the old rule for writing geographical or personal nouns in specific names. To come to Mr. Batson's examples. In the name *Erigeron Roylei*, Roylei is a noun substantive, and therefore has a capital, as before; but royleana is an adjective, and therefore has now an initial small letter. In the other examples from the Kew *Herbaceous Hand-List*, *Acæna Novæ-Zelandiæ*: Novæ-Zelandiæ is a geographical proper name and a noun substantive, and as such has always been written in specific names with an initial capital; if it had been novæ-zelandiæ it would have had an initial small letter. Similar names are *Aster Novæ-Angliæ*, and *A. Novi-Belgii*, which have always been so written. *Acantholimon assyriacum* is consistent with the rule; if the name were *A. Assyria* it would have a capital. *Dracocephalum Moldavica* is quite consistent with the old rule. If Mr. Batson will refer to the *Index Kewensis*, he will find that *Moldavica* is an old genus of Tournefort, now absorbed in *Dracocephalum*. Such names have always been written in good botanical works with a capital letter, being used as nouns in apposition. I may further say that, having, for my amusement, looked very carefully through the last edition of the Kew *Herbaceous Hand-List* as soon as published, I am prepared to stand sponsor for it, and to assert that it contains no inconsistencies in the application of the new rule. If Mr. Batson can find any, and will send them to me, I will explain them. A very few typographical errors which I found were sent by me to the Director of Kew, and courteously accepted by him. These are all noted in my own copy of the *Hand-List*. *C. Wolley-Dod, Edge Hall, Malpas.*

Obituary.

MR. WILLIAM HOUSLEY.—We regret to have to announce the death, on the 25th ult., of this gentleman. He had been secretary of the Sheffield Chrysanthemum Society for fourteen years, and was highly respected. At his funeral a large number of representative members of the Sheffield and other Chrysanthemum Societies were present, and a still larger number testified their regard by sending wreaths. Mr. H. Willford, 96, Greenhow Street, Walkley, Sheffield, is acting as secretary for the time being, and all communications relating to the Society should be addressed to him at the above address.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 1—Tuesday last being the occasion on which the Royal Horticultural Society's hospitality was extended to the National Dahlia Society, ordinary exhibits at the Drill Hall, Westminster, were not encouraged. The Dahlia show requires the whole of the space on the ground floor, and the parent society therefore could only invite its regular exhibitors to show new plants, flowers, fruit, or vegetables that were submitted for certificates. The Committees sat upstairs in the canteen, and there were displayed most of the exhibits that were not Dahlias.

The ORCHID COMMITTEE recommended two Awards of Merit and one First class Certificate.

The FLORAL COMMITTEE recommended nine Awards of Merit and one First-class Certificate, five of these awards being to new species of *Vitis*, introduced from China by Messrs. J. VEITCH & SONS. No novelty gained an award from the Fruit and Vegetable Committee.

In the afternoon a lecture upon "Judging Cactus

Dahlia" was read by Mr. C. G. WYATT, and upwards of twenty new Fellows were elected to the privileges of the Society.

The Dahlia show, of which a full report is given in another column, was very satisfactory.

Floral Committee.

Present: H. B. May, Esq. (Chairman); and Messrs. R. Dean, C. T. Drury, J. F. McLeod, W. Howe, G. Reuthe, W. Bain, H. Turner, C. E. Pearson, Chas. Jeffries, R. W. Wallace, Rev. F. Page Roberts, R. C. Notcutt, E. H. Jenkins, W. J. James, Geo. Paul, W. Marshall, J. Walker, J. Fraser, E. T. Cook, and John Green.

Messrs. W. WELLS & Co, Earlswood Nurseries, Redhill, showed an attractive group of Chrysanthemum flowers, from plants growing in the open. These included the excellent border varieties Carrie (rich yellow), Pearl (rose coloured), Champ de Neige (white), Gertie, Goacher's crimson, Blush Beauty, and another mentioned under "Awards."

HOBBIES, LIMITED, Dereham, Norfolk, exhibited several new varieties of Fuchsias, and some pretty little plants of *Iris pallida foliis variegatis*, in which the variegation was particularly distinct and effective.

Mr. J. YOUNG, High Street, Southend, exhibited a scarlet, semi-double-flowered Zonal Pelargonium of dwarf habit named Southern Gem.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, exhibited, in addition to a number of new species of *Vitis*, *Buddleia variabilis Veitchiana*, 9 feet high, with purple inflorescences, 1 foot long; and *Calceolaria Burbidgei*, a hybrid that ought to be well-known and grown in every garden. It is in bloom almost all the year round in the greenhouse (No. 4) at Kew, and few can have visited Kew at any season and not have seen it.

Mr. W. C. BULL, Ramsgate, showed a good variety of *Gladiolus Lemouinei*, cream-coloured with red stain and deeper cream-colour on the lower segments.

A species of *Hippeastrum* from South America, shown by Col. TILLOTSON, Beckbury Hall, Shifnal, Salop (gr., Mr. F. G. Thomas), has greenish flowers, in which the three outer segments incurve until the pointed tips meet, and the inner three segments reflex.

Awards.

Chrysanthemum "The Champion."—A border variety of golden-yellow colour, flowers 4 inches across; florets, $\frac{1}{2}$ of an inch wide, slightly incurving at the tips. Shown by Messrs. W. WELLS & Co, Earlswood, Surrey (Award of Merit).

Chrysanthemum maximum variety "King Edward."—This is an immense-flowered variety of this well-known border flower; the blooms are $5\frac{1}{2}$ inches across. Shown by Mr. W. ANGUS, Penicuik Gardens, N.B. (Award of Merit).

Gladiolus gandavensis "Van Dael."—A large, bright rose-coloured variety, with crimson markings, and a central mark of paint-like white on each segment. Shown by Messrs. WALLACE & Co., Kilnfield Gardens, Colchester (Award of Merit).

Hedysalga Wercklei.—This plant was figured and described in the *Gardeners' Chronicle* for August 4, 1900, p. 83. It is known as the Climbing Dahlia, because its single scarlet flowers are like those of a single Dahlia. Most suitable for training on the rafters of a greenhouse, as is done with such good effect at Kew. Shown by Sir TREVOR LAWRENCE, Bart. (gr., Mr. Bain) (Award of Merit).

Tamarix hispida æstivalis.—A variety with rich rose-coloured inflorescence; very effective. Shown by Messrs. R. VEITCH & SONS, Exeter (Award of Merit).

Vitis armata.—In general character something like *V. Cœlestis*. Leaves about 7 inches across with toothed margins, colour olive-green. Stems and petioles of leaf reddish-brown, rather thickly studded with short fleshy spines. From Central China. Shown by Messrs. JAS. VEITCH & SONS (Award of Merit).

Vitis flexuosa Wilsoni.—A slender-growing variety with ovate, acuminate leaves $2\frac{1}{2}$ to 3 inches across. Shown by Messrs. JAS. VEITCH & SONS (Award of Merit).

Vitis megaphylla.—This is a species with much compounded leaves, reminding one more of a *Kœlreuteria* than of a *Vine*. The green leaf with reddish petiole measures about 16 inches long. From Central China. Shown by Messrs. JAS. VEITCH & SONS (Award of Merit).

Vitis sinensis.—A species with reddish-purple, lobed leaves covered with soft hairs on the under surface. Shown by Messrs. JAS. VEITCH & SONS (Award of Merit).

Vitis Thomsoni.—Of rather slender habit, and having digitate, rather reddish leaves. Described by the late

Professor Lawson in *Hook. Fl. Brit. Ind. I. 657*. Shown by Messrs. JAS. VEITCH & SONS (First class Certificate).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), W. H. White, W. Boxall, J. Wilson Potter, E. Hill, J. W. Odell, F. Sander, W. Cobb, and De B. Crawshaw.

Messrs. CHARLES WORTH & Co, Heaton, Bradford, were awarded a Silver Flora Medal for a group composed of *Sophro-Lælia* × *Gratrixia magnifica* (L. tenebrosa × S. grandiflora), a fine flower, shaped much like L. tenebrosa, of a reddish tint, veined with claret red; *Cattleya* × Mrs. Pitt "Heaton variety," with rose sepals and petals, and fine orange disc to the lip; C. × Lord Rothschild "Heaton variety," *Lælio-Cattleya* × Admiral Dewey, L.-C. × Donna Roma, L.-C. × elegans, L.-C. × Gottoiana, L.-C. × Issy, *Cattleya* × Germania, C. × Suavior superba, C. × Niobe, *Rodriguezia Claesiana*, &c.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Bankstan Medal for a good group, in which were *Cattleya* × *Exquisita*, a charming new hybrid (see Awards), *Lælio-Cattleya* × *Britannia* (L.-C. × *Canhamiana* × C. Warscewiczii), a large white flower tinted with rose, the front of the labellum being rose-purple, the disc sulphur-yellow; many varieties of L.-C. × *Bletchleyensis*, and L.-C. × *Martinetii*; *Cattleya* × Mrs. J. W. Whiteley, *Cypripedium* × *Transvaal*, and other *Cypripediums*; *Miltonia Roezlii*, M. spectabilis, and M. vexillaria; *Odontoglossum Kramerii*, O. × *lepidum*, &c.

Messrs. B. S. WILLIAMS & SONS, Holloway, showed a group made up of a good collection of specimens of fifteen kinds of hybrid *Cypripediums*, including C. × *Lebaudyannum*, C. × *Thorntoni*, and C. × *Harrisianum vivicans*; also *Lælia crispata*, *Cœlogyne Massangeana*, *Vanda tricolor* "Glen variety," and V. tricolor superba.

JEREMIAH COLMAN, Esq., Gatton Park (gr., Mr. W. P. Bound), showed *Lælio-Cattleya* × *Heary Greenwood* "Gatton Park variety," a grand form, the largest yet seen, and of fine colour; L.-C. × *Bletchleyensis gloriosa*, a very dark variety with bronzy-yellow sepals and petals, changing to pale rose towards the margin, and with dark purple lip; and a strong plant of *Odontoglossum bictoniense* with three spikes.

WALTER COBB, Esq., Tunbridge Wells (gr., Mr. J. Howes), showed *Coryanthes Cobbii*, an unspotted form of C. maculata; sepals and petals yellowish-white, lip tinged with orange colour.

Messrs. STANLEY ASHTON & Co., Southgate, showed *Cattleya* × *Crashleyi* (*granulosa* × *Loddigesii*?), a near ally of C. × Mrs. Mary Gratrix.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr., Mr. J. Davis), showed a fine plant of the curious *Catasetum Russellianum*, with a strong spike of whitish, green-lined flowers.

Awards.

FIRST-CLASS CERTIFICATES.

Cattleya × *Pittiana*, "J. Wilson Potter's variety" (*granulosa* Schofieldiana × *Dowiana aurea*).—From J. WILSON POTTER, Esq., Elmwood, Croydon (gr., Mr. W. H. Young); one of the largest and best of the C. granulosa hybrida, and in which the typical C. granulosa form of flower is very prominent, although enlarged, and much beautified. The large sepals and petals were of a bronzy-yellow hue tinted with rose; the labellum marked with orange in the centre, the front being purplish ruby-red, the fimbriated margin bluish-white.

AWARD OF MERIT.

Cattleya × *Tankerville* (bicolor × Rex).—From Messrs. STANLEY, ASHTON & CO., Southgate. Sepals and petals cream-white tinged with primrose, the lip, with the very small side lobes, and long, narrow isthmus, as in all hybrids of C. bicolor, bright purple.

Cattleya × *Exquisita* (*luteola* Holfordii × *Parthenia* "Prince of Wales").—From Messrs. SANDER & SONS, St. Albans. A charming gem of a fragrant, white-flowered Orchid, with the neat habit and profuse blooming qualities of the yellow C. luteola. Flowers clear white, in shape resembling those of *Cattleya Mossiae*, though not so large. Labellum with a rich yellow disc, and bright purple marbling in front. The parentage is very interesting, for whereas it is from C. luteola, one of the most distinct of species, on the one side, the agent on the other was produced by C. × *calummata* (fimbriata) × *Mossiae* Wageri, and from the latter the form of the flower descends. The neat little plant shown had two spikes of three and two flowers respectively.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq., V.M.H. (Chairman), and Messrs. H. Balderson, H. Esling, O. Thomas, F. Q. Lane, G. Reynolds, J. Willard, H. J. Wright, J. Gibson, A. Dean, W. Fyfe, G. Keli, J. Jaques, H. Markham, W. Poupart, S. Mortimer, J. Cheal, and Rev. W. Wilks.

Prior to the inspection of exhibits it was resolved that all the awards recommended by the members of the Fruit Committee at Chiswick on August 24, a full quorum not then being present, he agreed to. These recommendations were mentioned in our report last week.

The next business was the reading of a very interesting report from Mr. Jaques, who, at the request of the Committee at the preceding meeting, undertook to be present and inspect, on behalf of the Royal Horticultural Society, a method of packing home-grown fruit for transmission to the tropics by Mr. A. F. Turnbull, of Mark Lane, City. It was agreed to ask that, to secure an important opinion as to the condition of the fruit on arrival, Mr. Turnbull be asked to pack a similar box, using his patent packing material (a white powder), and that it be sent to Sir Daniel Morris, at Barbados, whose report would naturally secure the fullest confidence. Mr. Jacques was cordially thanked by the Committee, and his report will in due course be published in the Society's Journal.

General exhibits were not numerous; Mr. Clarke, gr. to Lady PLOWDEN, Aston Rowant Hall, Oxon, staged a collection, including good Dymond Peaches; Humboldt, Lord Napier, Pine-apple; Stanwick, Elruge, and Newton Nectarines; Reine Claude de Bayav and 'Queische St. Martin Plums, and fine Lemons (Silver Bankstan Medal).

Mr. W. Howe, gr. to Lady TATE, Streatham, had a box of fine Bourjassotte Grise Figs (Cultural Commendation).

Mr. W. FYFE, The Gardens, Lockinge, sent a handsome early white Apple, striped red, named Miller's Seedling. It seems to be known in Sussex as "The Miller." The fruits were hardly ripe, but when so are pleasant eating.

Messrs. GOFF & Co, Floral Nurseries, Littlehampton, had a large green-flesh Melon. Mr. Clarke, gr. to Lady PLOWDEN, sent a scarlet-flesh variety named Aston Rowant; and Messrs. DOBBIE & CO., Rotheray, had a selected form of the Cantaloupe Melon, round and much sutured. No awards were made.

Mr. B. WADDS, gr. to Lord MIDDLETON, Birdsall, Yorks, sent two bunches of white Grapes, one thinned, the other not. The variety was supposed to be the product of crossing the Strawberry-Grape with Ferdinand De Lesseps Grape. The skins were very tough and the flesh acid.

Messrs. RIVERS & SONS, Sawbridgeworth, had a few Peaches to show effects of inarching. They were referred to the Scientific Committee.

Mr. R. MAHER, Yattendon Court, Newbury, showed Vegetable-Marrow named Codlin's Cream; and Mr. P. CANTLY BRIGG had a dish of over-ripe Tomatos.

The Lecture.

JUDGING CACTUS DAHLIAS.

Before calling upon Mr. Wyatt to read a paper upon "Judging Cactus Dahlias," Mr. EDWARD MAWLEY, who presided, said that there had been considerable indefiniteness in regard to the points that constituted a good exhibition flower of this type, and it was arranged early in the year that Mr. Wyatt should introduce the subject, so that there might be brought about a greater uniformity in their aims, and that there might be a greater degree of certainty in regard to the type of flower that should gain most points at exhibitions.

Mr. WYATT explained the need that existed for introducing some rule in regard to the judging of these flowers, and said that an exhibit of Cactus Dahlias might gain points for each of the following qualities—form, size, colour, and effectiveness in the setting-up of exhibit. In a Cactus Dahlia it was important that the florets should be long and narrow, and folded back at the edges. It should not have a very large disc, the centre should be closed, and there should be no flat florets. A good flower should show perfectly the peculiar characteristics of the variety, whether in form or colour. Mr. Wyatt recommended that the four qualities already enumerated should be valued as follows, making in all a maximum of ten points:—

- Forn, 4 points.
- Size, 3 points.
- Colour, 2 points.
- Setting-up, 1 point.

The maximum number of points for size should only be given when the flower was quite free from coarseness; the colour should be clear, clear, and the flower

free from blemish or injury; paleness of colour due to overshadowing or other cause should be judged to be a defect. In judging a bunch of one variety the bunch should be judged as one flower only, as the "trebles" are judged at the Rose exhibitions.

The Rev. W. WILKS, M.A., preferred to rank "colour" next to "form," and before "size." He considered that "form" was the principal point in all flowers; but that as taste in regard to correct form was constantly changing, it was not wise to be too definite in defining the qualities of form in accordance with the ideas of the moment in respect to what the form ought to be. Mr. Wilks regarded mere size in all flowers, fruits, and vegetables as "a despicable thing." He thought they should give to "size" by itself as little consideration as it was possible to persuade professional growers to agree to. He was confident that amateurs would prefer to give it no consideration at all. He agreed there should be a point or more for effective "setting-up" of vases or groups, but single flowers of new varieties submitted for certificate should be judged as flowers only, as flowers that would be "set up" in the future if they were sufficiently good to be recommended for the purpose.

Mr. STREDWICK, who is well known as a successful raiser of Dahlias, was inclined to favour the small Dahlia. If he had to please himself only he would never issue a Cactus Dahlia more than 6 inches in diameter, but as a raiser he was bound to consider the opinions held generally by exhibitors and cultivators. He was strongly in favour of awarding points for effective "setting up." If healthy plants were put into maiden loam they would generally give good flowers, even if little attention were given them, but they cannot stage themselves at exhibitions. He had seen at that show flowers that were perfectly grown, which result he should credit very largely to Nature, and they were staged shamefully, for which he was obliged to credit the exhibitor. Mr. MARSHALL was offering a prize at the show to be held shortly at Earl's Court, with a view of encouraging the production of a race of Pompon Cactus flowers, and if this succeeded his hearers might depend that Cactus varieties measuring about 2½ inches in diameter would be found the most beautiful flowers the Cactus Dahlia was capable of producing.

Mr. FREDERICK TRESEDER (Cardiff) said they were not discussing the Dahlia merely as a flower, but as an exhibition flower. He thought that other things being equal, a flower that possessed unusual size without suffering in refinement should win in a competitive exhibition. He was also of opinion that the National Dahlia Society should not attempt to define what is a Cactus Dahlia and what is not. Tastes differed, and the differences should be respected.

An amateur supported Mr. Treseder's views, saying the cultivator who secures "size" but retains refinement has done most; and contended that flower-shows would cease to be attractive to the public were "size" ignored, for the "British public" expected and demanded "size" in exhibition flowers as in everything else.

Another member supported Mr. Treseder, and yet another pleaded that "size" need not be feared so long as refinement was insisted upon. Some varieties—for instance, Mrs. Crowe—even when 7½ inches across, was never coarse; and a large flower of equal refinement must be given preference.

Mr. J. F. HUDSON protested against the false idea of "size" that had been preached. The variety Mrs. Crowe might possess refinement even if it was 7 or 8 inches across; but the question was this—was it so beautiful then as it would be if it were but 6 inches? He thought not. The Cactus Dahlia, thought Mr. HUDSON, could only reach its ideal of beauty when 6 inches or less.

The Chairman, in summing up, thought they could not afford to ignore size altogether; but mere size would never do much harm if judges insisted upon thinness of florets and narrow petals.

Subsequently Mr. Wyatt said that he placed "size" before "colour," because he regarded the latter quality as the free gift of Nature, and the former as the result of the hard work of the cultivator.

BRIGHTON AND SUSSEX HORTICULTURAL.

AUGUST 25, 25.—This exhibition was held on the above dates in the Dome, Corn Exchange, in an annexe of the Dome, and in a large marquee in the grounds, and it is the twelfth of the Society's annual exhibitions. Alike with regard to the number of exhibitors and of entries, it was the most successful exhibition the Society had as

yet held. There were 114 exhibitors as against 65 last year, and 485 entries as against 335. The area of the Dome and Corn Exchange is very large, and there was much room unoccupied by exhibits. The Fern groups in the marquee were very pretty; Roses numbered eighteen entries; hardy herbaceous cut blooms were abundantly and well shown; Apples of good quality did not convey the idea that the crop is this year a bad one.

The competition in the Dahlia and Gladiolus Classes was weak. The large group set up by Messrs. BALCHIN & SONS was an admirable example of skilful arrangement of plants in pots.

Grapes of good quality, Peaches, Nectarines, Plums, Apples, and Melons were numerous, and generally of very good quality. Vegetables and Potatoes, especially the latter, were very good.

In the Corn Exchange there were fifteen small tables on which table decorations were arranged; these were, as is usual, of various degrees of elegance and appropriateness; the prizes awarded being, 1st, Mrs. F. LINDSAY, The Laurels, Hailsham, the material used being Gypsophila, Bougainvillea, Anemone japonica in variety, Sweet Peas, Maidenhair Fern, Grass haulms, &c.; 2nd, Mrs. COLEMAN, Ferring, near Worthing, with a device made of Montbretias, Ferns, Gypsophylla, &c.; 3rd, Mrs. A. COOPER, Broadwater, Worthing, a device in Carnations in white and pink-flowered varieties.

A good feature in showy Carnations consisted of a table 5 feet by 5 feet filled with Carnations in great variety, the centre raised about 2 feet above the flowers on the rest of the table, the whole being interspersed with Adiantums, Asparagus, Fittonia, Myrsiphyllum, Tradescantia, &c. The exhibitor was Miss SHIFFNER, Coombe Place, Lewes. There were two other tables of the same character.

Table Plants to the number of six were shown in response to offers of special prizes, and consisted of *Panax variegatum*, *Codiaeum*, *Kentias*, *Dracenas*, &c.: 1st, Mr. GARNETT; 2nd, Mr. W. E. ANDERSON.

Baskets of Flowers were few, and consisted of two only that showed much taste in arrangement or goodness of material, viz., that of Miss YELLAND and Mr. H. GARNETT. Of stove and greenhouse cut flowers there were our boxes of twelve bunches each. That which took the 1st prize consisted of *Rochea falcata*, *Tecoma jasminoides*, *Cattleya gigas*, *C. Gaskelliana*, *Dipladenia amabilis*, *Gloriosa superba*, &c.

Bathroom bouquets were well shown by Mr. A. W. TROSELL, Tonbridge, Kent, and Miss A. F. HARWOOD, Colchester, the former consisting of *Cattleya*, blue Sweet Peas, *Francoa ramosa*, and greenery of a light description; and the latter of *W. Allan Richardson Rose*, *Hypericum calycinum*, *Montbretia*, and a reddish orange coloured *Cactus Dahlia*—a telling study in orange and yellow. Bridal bouquets were also shown, all very pretty and tastefully made.

Cactus Dahlias were shown in numbers. The 1st prize (especially offered by Messrs. J. Cheal & Sons) was taken by PERCY W. TULLOCH, Esq., Sterndale, New Church Road, Hove. Show Dahlias in these classes were but few.

The Rotunda was furnished with a semicircle of tabling, on which were displayed plants of tuberous Begonias in pots, the winner of the 1st prize for which was Mr. J. BACKSHALL, gr. to J. LAWSON, Esq., Highlands, Hassocks; and of the 2nd prize, Mr. G. NORMAN, gr. to P. H. BAYER, Esq., Hatch Beauchamp, Withdean.

A quantity of hardy herbaceous perennials, as cut flowers, of fine quality, such as *Lilies*, *Montbretias*, *Anemone japonica*, *Tritomas*, *Helianthus*, *Chelone barbata*, *Gladiolus*, &c., were shown by Mr. J. DAVIS, gr. to Major TRURLOW, Buckham Hill House, Uckfield, who was 1st in a class for eighteen distinct species of hardy perennial or bulbous flowers in bunches.

DAHLIAS: COMPETITIVE CLASSES.

Gardeners and Amateurs.—Pompon Dahlias: 1st for six varieties, Mr. J. Harper, gr. to — TUCKER, Esq., Vernon Lodge, Preston.

Six *Cactus* varieties.—1st, PERCY W. TULLOCH, Esq., Hove, with *Phineas*, scarlet; Mrs. Ed. Mawley, primrose-yellow; Gloria, rosy-purple; and J. H. Jackson darkest claret, as the best blooms.

Open Classes—The best dozen *Cactus* varieties came from Messrs. J. STREDEWICK & SONS, Silverhall Park, St. Leonards, very fine being the varieties Comet mauve; Florence Stredwick, cream; Columbia, scarlet and white; Osprey, yellow with scarlet stripes; Oliver Twist, scarlet; and Falcon, rosy-purple.

Messrs. J. CHEAL & SONS were 1st for single-flowered varieties, and also for a dozen Pompons.

Show varieties were few, and in the class for twenty-four, distinct, Messrs. CHEAL & SONS took the 1st prize, the 2nd prize being taken by Mr. J. BROWN, 120, High Street, Worthing.

A large marquee erected in the grounds held a quantity of Ferns, Palms, and foliage plants, as well as groups set up for effect or to indicate methods of arrangement with Ferns and mixed flowering and foliage plants. In the former Mr. Jas. Adams, gr. to the Rev. Sir G. C. SHIFFNER, Bart., Coombe Place, Hamsay, Lewes, was 1st, taking the Corporation Challenge Cup and a Silver Medal with *Adiantum* of diverse

species, *Pteris cretica* alba and others, and species of a weeping habit.

Coleus.—The 1st prize was taken by six pyramids of distinct varieties, shown by Mr. G. SIMS, gr. to E. A. WALLIS, Esq., Sunnyside, Upper Lewes Road, Brighton.

Fuchsias, six specimens.—1st, Mr. H. HEAD, The Drive Nursery, Hove, with bushes 3 to 4 feet in height, finely bloomed.

Caladiums, six specimens.—1st, Messrs. W. MILES & Co., Church Road, Hove, with plants of moderate size, but fresh looking. This exhibitor was also 1st for *Fuchsias*, to the number of six, these being in bush form and under 4 feet in height.

Zonal Pelargoniums.—For six specimens, various, 1st, Mr. Jas. Rogers, gr. to Mr. C. E. F. STANFORD, with well-bloomed plants from 3 to 4 feet in diameter.

GARDENERS AND AMATEURS.

Plant Groups not exceeding 13 by 7 feet.—There were many competitors in this class of miscellaneous flowers and foliage plants, and the exhibits were of varying degrees of excellence. 1st, Mr. W. E. ANDERSON, gr. to B. PARISH, Esq., Melodia, Preston Park. This group consisted of *Lilies*, *Campanula pyramidalis* Valloita, *Gloxinias*, *Celosia pyramidalis*, small Palms, *Tuberoses*, *Codiaeums*, &c. disposed on a carpet of *Adiantum* and *Coleus* with a white-and-green leaf.

Groups 20 by 9 feet, Open.—In this competition, Mr. G. MILES, Victoria Nursery, Dyke Road, was 1st, taking a handsome Silver Bowl and a Silver Medal for a good rich group pleasingly arranged. The background consisted of a very dark-flowered *Bougainvillea glabra*, *Lilium speciosum album*, *Codiaeums*, *Tuberoses*; and in the front of this there were thinly-arranged *Oncidiums*, *Eucharis*, *Carnations*, small *Caladiums*, *Begonias*, and under all a carpeting of *Maidenhair*. 2nd, Mr. JOHN HARPER, who had a showy group, but in which *Lilies* were too lavishly employed.

Palms were shown by Mr. H. GAHNETT, 1st; and Messrs. MILES & Co., 2nd.

FRUIT.

Collection of fruit, eight dishes distinct, Pines excluded.—1st, Mr. J. GORE, Fruit Grower, Polegate, with three middling bunches of *Muscat of Alexandria*, two of them lacking in colour; three bunches of *Gros Colmar*, massive and of good colour; fine Williams' *Bon Chrétien* Pears, McIndoe's Best of All Melon, Milton Nectarine (very fine), Apple Lady Sudeley, Peach Dr. Hogg, and Figs Brown Turkey. The 2nd prize went to Mr. Edwin Neal, gr. to Mrs. NIX, Tilgate, Crawley, who had massive bunches of Black Hamburg Grapes, fine Royal George Peaches, and Pineapple Nectarine. 3rd, Mr. CHAS. EARL, gr. to O. E. D'AVIGOR GOLDSMITH, Esq., Somerhill, Tonbridge, whose Grapes, Peaches, and Apples were a creditable production.

For a collection of nine bunches in three varieties of Grapes.—1st, Mr. G. GORE, Polegate, for three fine bunches of *Gradiska*, white; three massive bunches of *Gros Maroc*, and for three of *Muscat of Alexandria*, of fair size but lacking in colour. 2nd, Mr. W. TAYLOR, gr. to C. BAYER, Esq., Tewkesbury Lodge, Forest Hill, S.E., with *Gros Maroc*, big-berried and massive bunches; beautifully finished *Chasselas Napoleon*, and capital *Madresfield Court*. Mr. J. SEYMOUR, gr. to T. W. CROOK, Esq., Seldenville Vineeries, Worthing, was 3rd, his *Black Alicante* and *Muscat of Alexandria* being very superior examples.

Muscat of Alexandria, three bunches of this variety.—1st, Mr. J. SEYMOUR, with fine, regularly shaped, well ripened bunches; 2nd, Mr. C. H. JONES (gr., Ote Hall, Wivelsfield); 3rd, Mr. ED. NEAL, with long, slender, but heavily shouldered bunches.

Three bunches of Black Hamburg.—1st, Mr. CHAS. NEAL, Tonbridge, with bunches perfect in shape, colour, and berry; 2nd, Mr. ED. NEAL, with large straggling bunches of great weight; 3rd, Mr. KEMP, with fine large bunches which had been carelessly handled or packed, a fact that probably accounted for their being placed 3rd.

Peaches and Nectarines were rather extensively shown, and in numerous instances the fruit was exceedingly fine in size and colour.

Melons numbered five exhibits of two fruits each, and eleven of one fruit each.

The Early Desert Apples.—Four dishes of Worcester Pearmain, Kerry Pippin, and Lady Sudeley, which obtained the 1st prize, were shown by Mr. F. W. THOMAS, Wannock Garden, Polegate.

Kitchen Apples were well shown by several exhibitors, especially by Mr. C. NEAL, who was 1st; 2nd, Mr. F. W. THOMAS, Wannock Gardens, who had fine Peasgood's Nonsuch, The Queen, &c.

The exhibit of Plums consisted of twenty-four dishes in variety, good, well-coloured fruits.

VEGETABLES.

These were plentiful and good, Onions, Cauliflowers, Celery, Leeks, Peas, and Beans being of especially good quality, owing to the dripping nature of the summer; Potatoes were free from scab, nearly all were kidney-shaped.

The best collection of Potatoes was shown by Mr. W. BROWN, Police Station, Rottingdean.

For a collection of vegetables, Mr. W. MANTON, gr. to the Rev. R. MASHITER, was 1st, the Best-of-All and Sutton's A1 Runner Beans, Snowdrop Potatoes, Solid White Celery, Ailsa Craig Onion, and Autumn Giant Cauliflower being fine. The 2nd prize was taken by Mr. M. TOURLE, gr. to F. BARCHARD, Esq., Horstead Place, Uckfield, who showed Runner Beans Elephant, Model Telephone Peas, and Snowball Potatoes, in very fine condition.

The exhibitor of the best six kinds was Mr. A. SIMMONS, gr. to Sir FRANCIS OSBORNE, Bart., The Grange, Framfield, who had fine Alderman Peas, Sensation Potatoes, and Tomato Duke of York.

TRADE EXHIBITS.

Messrs. JOHN PEED & SON, West Norwood, exhibited hardy cut flowers of good quality and in much variety; Sweet Peas, *Gloxinias*, double and single-flowered *Begonias*, as cut blooms. Not for competition.

Messrs. J. CHEAL & SONS, Crawley, showed fruit trees in pots, hardy perennials as cut flowers, Dahlias, miscellaneous stove and greenhouse plants, *Phloxes*, *Tritomas*, *Heliothis scabra*, *Helianthus*, *Buddleia variabilis*, &c. Not for competition.

Messrs. BALCHIN & SONS, Brighton and Hove, showed a quantity of trees and shrubs as cut shoots; many have yellow or variegated foliage useful for planters. They also exhibited an elaborate group set up with much good taste at one end of the Corn Exchange. It was practically of a horse-shoe shape, and the plants employed consisted chiefly of *Lilium lancifolium album* arranged at the heels of the shoe and surrounded by dwarf plants of *Caladiums*, and having a vase in the centre holding a variegated *Pandanus*. Behind each of these groups stood a Palm 15 feet high surrounded by a ring of finely-coloured *Codiaeums*. The middle area was filled with a mixture of *Lilies*; *Odontoglossums*, *Crinum*, *Saxifraga sarmentosa variegata*, *Caladiums*, *Thunia alba*, *Dracena Sanderiana*, *Mesospidium*, &c.

Mrs. BANGER, Southwick, Brighton, exhibited a rustic arrangement in cork, decorated, as we think very incongruously, with gaudy Sunflowers, with Hollyhocks, *Campanula pyramidalis*, *Delphiniums*; while the foreground consisted of *Saxifrages*, *Auriculas*, *Pansies*, &c. Not for competition.

There were exhibits of annuals, tender and hardy; of Sweet Peas in much variety.

T. S. WAHE, Ltd., Feltham, exhibited a large showy group of hardy herbaceous perennials.

Mr. H. SKINNER, gr. to J. DUNK, Esq., showed, not for competition, a group of leaf *Begonias* in variety.

A Silver Medal was awarded to Mr. G. W. PIPER, Uckfield, for a comprehensive exhibit of Tea and Tea Hybrid Roses. The flowers had been taken at precisely the right moment, and they remained fresh-looking and charming. Not for competition.

NATIONAL DAHLIA.

"CACTUS TYPE LARGELY DOMINATES."

SEPTEMBER 1, 2.—Forty-five years ago there was held in St. James's Hall, Piccadilly, an exhibition of Dahlias, from which may be said to have sprung the National Dahlia Society. The show of 1858 was wholly of the show and fancy varieties; in the class for a device a few blooms of pompon varieties and also of dwarf bedding sorts might have been seen. There were but few pompons at that time, and they mainly of tall growth; it was a few years later that the late Mr. C. TURNER took the pompon type in hand, and greatly improved and extended the varieties. There were no *Cactus Dahlias*, and the single form was practically unknown. The introduction and improvement of the *Cactus* type have changed the whole aspect of the show; this type now largely dominates, and new forms are being numerously produced, showing much variation in colour; and while the bedding varieties, once so much grown, have, to a great extent, ceased to exist, the pompon varieties have greatly increased in numbers and popularity whilst the single Dahlias are less popular than they were a few years ago.

The present exhibition was a remarkably good one for the season, and there was a larger number of entries than was at one time anticipated. For lack of sunshine and warmth, a certain amount of roughness was discernible in the show and fancy varieties; the *Cactus* type was not free from it, though some excellent blooms were staged; even the pompons and singles lacked the fine finish seen in drier and warmer seasons. The whole of the Drill Hall was required to accommodate the exhibits. The miscellaneous collections, some of which were very imposing, were ranged round the sides of the Hall. There was a fairly good attendance; the atmosphere of the Drill Hall became very close during the afternoon.

Show and Fancy Dahlias.—There was little evidence of decline in the interest attaching to this section. In the large class for forty-eight varieties three collections only were staged, though space was reserved for two more entries. Messrs. KEYNES, WILLIAMS & Co., Salisbury, were placed 1st, having for the season good blooms of Brilliant, George Sanger, new of the present year; Darkest-of-All, nearly black; Mrs. Evry, Gloire

de Lyon, Henry Clark, new of 1903; J. N. Keynes, Arthur Rawlings, W. Keith, Watchman, Mrs. McKENZIE, John Walker, HENRICHTA, Mrs. SAUNDERS, J. Chamberlain, J. T. West, John Hickling, Dr. Keynes, Virginal, Gracchus, R. T. Rawlings, Mrs. Langtry, &c. Mr. C. TURNER Royal Nursery, Slough, was 2nd; Mr. S. MORTIMER, Swiss Nursery, Farnham, 3rd.

With thirty-six varieties Mr. W. TRESEDER, nurseryman, Cardiff, was 1st, having good blooms of John Walker, Mrs. Saunders, Mrs. Dodds, Henry Walton, Imperial, Sunset, A. Ocock, Mrs. Langtry, Goldfinder, Comedian, John Hickling, Disdem, Mrs. Slack, Majestic, Virginia, Duke of Fife, Duchess of Albany, Duchess of York, Mrs. Gladstone, Prince Henry, &c. Mr. S. MORTIMER was 2nd; his leading blooms were Virginal, Duchess of Albany, S. Mortimer, Watchman, Lilac Queen, and Reporter. Mr. JOHN WALKER, nurseryman, Thame, 3rd.

With twenty-four varieties, Mr. F. M. SEALE, Vine Nursery, Sevenoaks, was 1st with good blooms of Peacock, J. B. Service, Mrs. Saunders, Duchess of York, Dr. Keynes, Mrs. Gladstone, W. Keith, Minnie Hobbs, James Cocker, W. Powell, Frank Pearce, Matthew Campbell, &c. Messrs. J. CRAY & SON, nurserymen, Frome, were 2nd, also with some good blooms.

With eighteen blooms, Mr. GEORGE HUMPHRIES, Kingston Langley, Chippenham, was 1st. He had in good character James Cocker, Rev. J. B. M. Camm, J. T. Saltmarsh, Colonel, Miss Cannell, Arthur Rawlings, R. T. Rawlings, Mrs. Langtry, Mrs. Gladstone, John Walker, Ethel Britton, &c. Messrs. J. CRAY & SON were 2nd; and Mr. SEALE, 3rd.

With twelve blooms, Mr. J. R. TRANTER, Henley-on-Thames, took the 1st prize; among his blooms was a promising seedling. Messrs. J. CHEAL & SON, Nurserymen, Crawley, were 2nd.

Cactus Dahlias.—One of the principal points of interest in the show was the Open class for eighteen bunches of Cactus Dahlias in bunches of six blooms, the 1st prize carrying with it the holding for one year of a valuable Challenge Cup. The judging of this class was extremely difficult, two or three at least of the stands closely approaching each other in point of merit. Messrs. J. STREDWICK & SON, Dahlia specialists, St. Leonards, were placed 1st, having in their eighteen all but three varieties of their own raising; their new varieties were Mrs. J. W. Wilkinson, Merlin, Sirius, Pearl, Reliance, Amelia Roberts, Improved Magnificent, Oliver Twist, Falcon, H. L. Brousson, Osprey, Ella Kraemar, Florence M. Stredwick, Comet, Rainbow, and Ivanhoe. Some of these are described under the head of seedlings. Among the foregoing were some charming tints of pink and rose, and there were valuable additions to the striped section; the two other varieties were Columbia and Mrs. Winstanley. A Silver Medal was awarded to the variety H. L. Brousson, as the best Cactus Dahlia in the open classes. This firm has now taken for a few years past a decided lead as raisers of Cactus Dahlias; Messrs. J. BURRELL & CO., Nurserymen, were a close 2nd, very little indeed dividing the two stands; nearly all the varieties were raised by the exhibitors. Messrs. J. CHEAL & SON, were 3rd.

With twelve bunches of six blooms, Mr. JOHN WALKER, Nurseryman, Thame, was 1st, having excellent examples of Phineas, Mrs. Mawley, Richard Dean, Ianthe, Raymond Parkes, Alpha, Lord Roberts, Uncle Tom, J. W. Fyfe, Eva, H. J. Jones, and Crimson Gem; Mr. S. MORTIMER came next; and Mr. C. TURNER was 3rd.

With forty-eight cut blooms shown on boards, there was a very close competition, the difference in pointing the blooms between the first three being very slight. Messrs. J. BURRELL & CO. were placed 1st, and out of the four dozen blooms they had, all of very fine quality, forty at least were of their own raising; chief among them were J. W. Wilkinson, Mrs. E. Mawley, Annabel, Chameleon, Dulcis, Mrs. De Luca, Laurette, Blanche, Rosine, Minnie West, H. T. Robertson, Trojan, Elia, Ida, Zoe, J. H. Jackson, Alice Decima, and Premier. Messrs. KEYNES & CO. were 2nd, and Messrs. J. STREDWICK & SON, 3rd.

There were eight boards of twenty-four blooms of Cactus. Mr. W. BAXTER, Nurseryman, Woking, was 1st with finely developed blooms of Ida, Ianthe, Lyric, Gabriel, J. H. Jackson, Mrs. Seagrave, J. W. Fife, Mrs. H. J. Jones, Ringdove, Lord Roberts, Etna, Mrs. J. J. Crowe, &c.; Mr. S. MORTIMER came 2nd; he had in very fine character Clara G. Stredwick, Gabriel, Mabel Tullock, Queen Alexandra, J. F. Hudson, Mrs. E. Mawley, Eva Vesuvius, &c.; 3rd, Mr. W. TRESEDER.

Cactus Dahlias in Vases.—With twelve varieties, six blooms of each, each bunch in a vase arranged with foliage; Messrs. J. CHEAL & SONS, were placed 1st. The flowers were set up in a very pleasing manner, with charming foliage used sparingly but appropriately. The leading varieties were Mary Service, Mrs. Mawley, W. Jowett, Clara G. Stredwick, Vesta, Floradora, Lyric, Lord Roberts, H. J. Jones, &c. Mr. F. M. SEALE was 2nd, and Messrs. KEYNES & CO., 3rd; good blooms were staged, but they were too much hidden by foliage. These vases made a good feature.

Pompon Dahlias.—These made, as they always do, a very pleasing feature, and it was gratifying to note that the judges gave the preference to small, compact, even-sized blooms. Mr. C. TURNER was placed 1st with an almost perfect collection, the varieties Bacchus,

Orpheus, Sylvia (new, pale ground tipped with purple), Distinction, Queen of the Whites (a charming new variety), Hesperia, Ganymede, Mignon, Adelaide, Nerissa, Darkest of All, Zorania, Nellie Bromhead, Cyril, Jessica, San Toy (white edged and tipped with rosy-purple, quite distinct), Malcolm (a new white), Romulus, &c. Messrs. J. CHEAL & SONS came 2nd; and Mr. F. M. SEALE, 3rd.

There was a good competition also with twelve bunches, Messrs. J. CRAY & SON taking the 1st prize with excellent blooms of Tommy Keith, Douglas, Lillian, E. Harper, Dr. Jim, Whisper, Bacchus, Nellie Bromhead, Novelty, &c. Mr. JOHN WALKER was 2nd; 3rd, Mr. G. HUMPHRIES.

Single Dahlias.—Two collections only of twenty-four bunches were staged, and they formed a pleasant change from the double flowers. Messrs. J. CHEAL & SONS were 1st with some charming bunches; chief among the varieties were Miss Girdlestone, Wm. Parrott, Beauty's Eye, Snowdrop, Royal Sovereign, Madge, Columbine, Hilda, Cerito, Victoria, Leslie Seale, Miss Roberts, Eric, Robin Adair, &c. Mr. F. M. SEALE was 2nd with Phyllis, Robin Adair, Columbine, Jeannette, Miss Glasscock, Fred Seale, Victoria, Yellow Perfection, Polly Eccles, Harry Brater, &c.

With twelve bunches of Singles Mr. JOHN WALKER came 1st. He had pleasing blooms of Edic Oblein, Duchess of York, Fascination, Aurora, Duchess of Westminster, Alice Seale, Robin Adair, Beauty's Eye, Susie Seale, &c. Messrs. J. CRAY & SON were 2nd; and Mr. G. HUMPHRIES, 3rd.

AMATEURS' DIVISION.

The amateurs are now a numerous body, and accessions are annually being made; a goodly number of small classes are included, and these give an opportunity for growers of small collections to show what they can do.

Show and Fancy Dahlias.—With twenty-four blooms Mr. THOS. ANSTISS, Brill, Bucks, an old supporter of the Society, was placed 1st, with excellent blooms of J. T. West, Mrs. W. Slack, Mrs. Langtry, W. Powell, John Hicking, Duchess of Albany, John Walker, Marjorie, R. T. Rawlings, Mrs. Gladstone, Dr. Keynes, &c.; Mr. J. PILLING, Gee Court, Hyde, was 2nd. In addition to the first of the money prizes in this class, Mr. ANSTISS also became the holder of a handsome Silver Challenge Cup.

With eighteen blooms there was a good competition also, Mr. A. PARKER, Ivy Hatch, Sevenoaks, taking the 1st prize; and Mr. S. COOPER, Hamlet, Chippenham, was a close 2nd.

With twelve blooms of show Dahlias only, Mr. J. NEWMAN, Bell Ino, Kingswood, Bristol, was 1st with Mr. Glasscock, Marjorie, Dr. Keynes, R. T. Rawlings, Duchess of York, Mrs. Glasscock, Florence Tranter, Richard Dean, John Rawlings, &c.; Mr. J. COUSINS, Green Lane, Cheltenham, was 2nd.

With six blooms of show varieties only, Mr. GEORGE HOOD, Langley Burrell, Chippenham, came 1st.

The best twelve fancy Dahlias were set up by Mr. S. COOPER, Hamlet, Chippenham, who had in good character Rev. J. B. M. Camm, Mrs. Saunders, Dandy, Hercules, Sunset, Watchman, Matthew Campbell, &c.; Mr. T. ANSTISS came a close 2nd.

With six blooms of fancies, the 1st prize fell to the lot of Mr. J. NEWMAN, who had well-developed blooms of Mrs. Saunders, Gaiety, Matthew Campbell, and Hero in his half dozen; Mr. J. COUSINS was 2nd.

Cactus Dahlias.—With six bunches, six blooms in each bunch, each shown in a vase arranged with foliage, there appeared to be only one exhibitor, Mr. E. TURNER, Hippington, Sevenoaks, who was placed 1st. For nine varieties, three blooms in a bunch with foliage, a class in which a Silver Challenge Cup was given, Mr. P. W. TULLOCH, the Secretary of the Society, Hove, Brighton, was placed 1st with excellent blooms of Mrs. E. Mawley (awarded a Silver Medal as the best bloom of a Cactus variety in this division), Mrs. H. J. Jones, J. H. Jackson, P. W. Tulloch, Florence, Miss F. M. Stredwick (a fine new white), H. T. Robertson, Mrs. Winstanley, Lyric, &c.; Mr. W. PETERS was 2nd. With six varieties also in bunches of three blooms, Mr. H. BROWN, North Street, Luton, came 1st; he had well-developed blooms of Ajax, J. W. Wilkinson, Lord Roberts, J. H. Jackson, Mrs. E. Mawley, and Up-to-Date. Mr. F. GUNSTED took the 2nd prize.

With twenty-four blooms of Cactus, shown on boards, there was a keen contest, Mr. H. A. NEEDS, Horsell, Woking, coming 1st with excellent blooms of Alpha, Mrs. E. Mawley, Floradora, Clara G. Stredwick, Uncle Tom, Lady Colin Campbell, J. W. Fife, Mabel Tulloch, Gaillard, Mrs. Clinton, Winnifred, Richard Dean, Ringdove, Lyric, &c. Mr. J. BRYANT, St. Martin's Terrace, Salisbury, was 2nd.

With twelve blooms, similarly shown, Mr. H. BROWN was awarded the 1st prize with Ajax, Chas. Woodbridge, Mrs. E. Mawley, J. W. Wilkinson, Lord Roberts, Rosine, Exquisite, Mrs. Carter Page, &c. Mr. E. T. MATTHEWS, 42, Almond Street, Derby, was 2nd.

With twelve blooms there was a keen competition, Mr. H. BROWN, Luton, being 1st; 2nd, Mr. E. T. MATTHEWS, Derby.

Pompon Dahlias.—The 1st prize for twelve varieties, six blooms of each, went to Mr. H. BROWN, who had some pretty varieties; and Mr. J. F. HUDSON was 2nd.

Single Dahlias were shown by amateurs in two classes in one case in six bunches of ten blooms, Mr. J. F. HUDSON taking the 1st prize, and Mr. E. MAWLEY, 2nd, both with excellent varieties.

Decorative Classes.—The best basket of Dahlias arranged with foliage was shown by Mr. H. A. NEEDS, who used pale-tinted Cactus varieties with bronzy and green foliage—a pleasing object; Mr. R. EDWARDS, Sevenoaks, came 2nd.

With a vase of Dahlias, Mr. NEEDS was again 1st; in this case he used scarlet and crimson Cactus Dahlias, with variegated and bronzy foliage. Mr. P. W. TULLOCH was 2nd; he had orange Cactus, with bronze and green foliage.

Mr. TULLOCH was awarded the 1st prize for three vases arranged with foliage; he had one variety of a Cactus Dahlia in each vase with pretty foliage. Mr. E. MAWLEY came 2nd.

The best shower bouquet of Dahlias came from Mr. W. TRESEDER.

The class for a basket of Cactus Dahlias arranged with any foliage brought three competitors, and the awards of the judges were not unanimously approved. Mr. SEALE was awarded the 1st prize. He used red and salmon-tinted flowers with pretty foliage; Mr. W. TRESEDER came 2nd with lighter colours, and many thought his arrangement the most tasteful; the 3rd basket had some weak points. There were several attractive vases of Pompon Dahlias.

SEEDLINGS.

The practice of the National Dahlia Society in relation to seedlings is open to grave objections. It is required that they have stems not less than 9 inches in length, without any support, and they are placed on a table by themselves, and after the judging is completed they are dealt with by the Committee and Judges. They were placed on this occasion at the end of a table near a window through which the sun shone brightly, and by the time they were dealt with they had taken on a deplorable hang-dog look, the flowers bent down over the vases, and in order to inspect the blooms they had to be held up aloft and looked at from below. As they are judged solely as exhibition flowers, all this appears to be needless. It would be much better to have all new varieties set up on supports as they are shown and judged in that form, and this should be done concurrently with the judging of the general classes, so that the blooms may be seen as fresh as possible.

Certificates of Merit were awarded to the following:—**Cactus Miss F. M. Stredwick.**—A charming and finely formed pure white variety, with a slight primrose centre; an addition to the group of white varieties, which is not too strong.

Cactus Sirius.—An excellent addition to the striped varieties. Bright yellow ground with stripes of crimson.

Cactus Mrs. J. W. Wilkinson.—Deep rosy-pink with a pale centre. Of a pleasing shade of colour, and a welcome addition to the pink and rose tinted varieties.

Cactus H. L. Brousson.—Delicate salmon on a pale yellow ground; pretty and refined. Selected for a Silver Medal as the best new seedling, though the opinion of the judges was not generally concurred in.

Cactus Pearl.—Of a beautiful soft rosy-pink shade, very pleasing and refined.

The foregoing five varieties were all from Messrs. J. STREDWICK & SONS, the raisers.

Cactus H. W. Sillem.—A large, bold, and striking bright crimson variety, promising to be valuable for exhibition purposes (H. SNOESMITI).

Pompon Queen of the Whites.—Delicate creamy-white; an average-sized flower of excellent form, petal, and centre (C. TURNER).

Pompon Edina.—Deep yellow, with a slight brownish-red centre; medium-sized, and of excellent form (C. TURNER).

Single Dahlia Princess of Wales.—Pink, with a delicate shading of bellotrope; a highly refined and distinct variety of perfect shape (J. CHEAL & SONS).

TRADE EXHIBITS.

Round the outside wall of the Hall were staged several very fine trade exhibits. Messrs. H. CANNELL & SONS, nurserymen, Swanley, had Cactus Dahlias in great variety and in bold bunches, alternated with panels of Kochia scoparia, and in addition some large broad-petalled decorative varieties from the Continent, including the Collarette types (Silver gilt Medal).

On the opposite side HOBBS (JOHN GREEN), Norfolk Nurseries, Dereham, had a very tasteful arrangement. Against a black background they had traced a series of arches of Smilax, and in front of this an imposing array of Cactus and other Dahlias, inclusive of some valuable new varieties (Silver-gilt Medal).

Mr. J. T. WEST, Dahlia Specialist, Tower Hill, Brentwood, had a large collection of Cactus and Pompon Dahlias in bunches, all in excellent character (Silver Medal).

T. S. WARE, Ltd., Hale Farm Nurseries, Feltham, had a large collection of bunches and single blooms of Cactus varieties, including many of the new varieties of last year (Silver Medal).

Messrs. W. CURTISH & SON, nurserymen, Hlghgate, also had bamboo-stands and vases of Dahlias in variety (Silver Medal).

ANSWERS TO CORRESPONDENTS.

** EDITOR AND PUBLISHER.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the literary department, and all plants to be named, should be directed to the Editor. The two departments, publishing and editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

ALDER FUNGUS: *F. W. B.* The outgrowth is due to a fungus, *Exoascus*, similar to that which produces Peach-blisters.

ARAUCARIA IMBRICATA CONING: *F. W.* The poor specimen about 30 feet in height will probably not survive many years. It is not uncommon for such trees to produce a large number of cones. If any of them should prove to contain seeds it will be proof that a male specimen exists in the locality, for the trees are dioecious, i.e., each is of one sex only.

BOUVARDIAS: *E. Q.* The injury to the tips of the shoots is the result of something not being quite right in cultivation. There is no disease.

CHRYSAETHENUM MAXIMUM: *Jas. Ross, Rowantree Nursery, Alexandria, N.B.* This is a capital variety, the flowers being 5½ inches across. The blooms are quite as large as those of "Edward VII.," described under "Awards," on p. 180, but the florets are rather less wide, and the general appearance therefore "starry" and attractive.

CUCUMBER LEAF-SPOT: *Telegraph* would be glad if we would answer the following questions with regard to Cucumber Leaf-spot. "1. The principal causes of spot? 2. What methods there are of safeguarding crops against spot, and of stamping out the disease when it first appears? 3. Can any remedy be applied which will both prevent and check spot disease, and which also will cause no damage or disfigurement to the growing fruits in connection with market sale? 4. Can the disease be introduced in the Cucumber seed bought from seedsmen? If not, how has the disease spread over such a wide area, when it first appeared in the Worthing district? 5. What is the best way to disinfect houses in which spot disease may have appeared, so as to prevent, if possible, a recurrence of the same next season? Briefly, from the above questions, I wish to know if spot can be treated and kept at bay without spoiling the fruits; what means to take to prevent or check an outbreak of it; and, in the case of spot showing, how to disinfect the houses so as to get rid of the pest on next season's crops."

ANSWER.

1. There is only one cause, that is a minute parasitic fungus called *Cercospora melonis*, of Cooke. 2. Can be safeguarded by avoiding "soft foliage," caused by the presence of too much moisture in the atmosphere, too free use of manure, and deficiency of ventilation. The latter is important, even if extra heat is required to maintain the required temperature. Spray every portion of earth in the house with Bordeaux-mixture once a week from the first, even if there is no evidence of the disease. With persistent attention the disease can be stamped out; or, better, it can be prevented from appearing by spraying with sulphide of potassium, 2 ozs. in 3 gallons of water, in which 2 ozs. of soft-soap is dissolved. Infection can only take place on the under-surface of the leaf, hence this portion should be thoroughly covered with the solution. Use this solution every other day instead of water that is used for syringing. The spraying taking the place of syringing. 3. Answered under No. 2, except to state that the solution will not injure the fruit. 4. The disease cannot be introduced with the seed. The spores are spread by wind, tools, clothing, insects, &c. 5. Empty the house and drench

every part inside with Bordeaux-mixture. Add gas-lime to the soil, and mix thoroughly at least two months before it is placed in the house. *G. Masee.*

FERN-CULTURE FOR MARKET: *C. E. B. W.* We do not know of any such book.

GLOXINIA: *F. P.* No, it is not new. Forty years ago there was a "race" of these plants, which form a supplementary corolla outside the first; but they have dropped out of cultivation, and now we only see imperfect specimens such as you send.

INSECT: *W. T. P.* *Sirex gigas*, the Giant Saw-fly; not uncommon, but very destructive.

MICROSCOPE: *C. E. B. W.* You cannot learn how to use the microscope from a book. You must get some friend to show you the way, or better still attend some class. As you are not far from Chelmsford you might make enquiry at the Laboratory there. You can get a microscope for from £5 to £50 and upwards.

MONKEY NUTS: *C. W. D.* *Arachis hypogea*, the ground nut of which you will find an account in the *Treasury of Botany*.

NECTARINE CRACKING: *H. J. K.* The supply of water has been in excess of what the fruit could deal with. It has done its best, but cracked in the effort.

NAMES OF FRUITS: *J. P.* The Pear is Jargonelle. —*S. L. Cook.* Probably Early Margaret, of Kent growers, but the specimens appear to be dissimilar, except for colour. Could you send others specimens, taking care that all are gathered from one tree?

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.* —*A. T. Cozens.* 1, *Veronica formosa*; 2, *V. anomala*; 3, *V. Haasti*; 4, *V. pinguifolia*; 5, *V. pimelioides*. —*P. T. W. Z.* *Davallia hirta* var. *cristata* as far as can be judged from the poor specimen. —*J. L.* *Linaria vulgaris*, common Toad Flax; natural order *Scrophulariaceae*, near to *Antirrhinum*. —*E. W.*, *Wales Court.* A species of *Echites* (a New World genus), perhaps *E. umbellata*; not likely to be indigenous in Australia. —*W. B.* *Desfontainia spinosa*; perhaps *Helleborus fetidus*. —*A. N.* 1, *Cotoneaster Simonsi*; 2, *Gnaphalium margaritaceum*; 3, *Sedum spurium*. —*Corokea.* Both forms of *Ficus stipularis*. —*H. J. P.* 1, *Mesembryanthemum* species; 2, *Sedum glaucum*; 3, *Monnarda didyma*; 4, *Lonicera brachypoda aurea*; 5, *Spiraea Lindleyana*; 6, *Achillea ptarmica* (double); 7, *Senecio Jacobea*; 8, *Achillea Millefolium*; 9, *Salix*, we cannot name the species. —*E. C. C. D.* *Salvia Horminum*, *Hydrocotyle vulgaris*. —*F. E. G.* *Itea virginica*. —*G. B.* *Silene Armeria*. —*A. B.* Spot on Grapes, see last week's issue; 1 and 3, species of *Inula*, which we cannot name; 2, *Olearia Haastii*; 4, *Achillea Ptarmica*, double; 5, *Veronica spicata*; 6, *Malva moschata alba*; 7, *Corydalis lutea*; 8, *Polemonium coeruleum*; 9, *Agrostemma Githago*; 10, *Campanula grandiflora*, sometimes called *Platycodon*; 11, not found; 12, *Alstromeria aurea*; 13, a hybrid *Veronica*. Another time do not send more than six; our time is precious, and we cannot find enough of that commodity to be able to hunt up species, the names of which we do not happen to remember. —*M. S.* *Odonoglossum* × *loochristyense*, a supposed natural hybrid between *O. triumphans* and *O. crispum*. —*J. H. D.* 1, *Iresine Lindenii*; 2, *Iresine Herbstii*; 3, *Alternanthera amœna*; 4, *Alternanthera paronychioides*. —*Vardon.* 1, *Oncidium ampliatum*; 2, *Oncidium flexuosum*; 3, *Odonoglossum constrictum*; 4, *Odonoglossum Lindleyanum*. —*C. J.* 1, *Bocconia cordata*; 2, *Funkia ovata*; 3, *Spergularia pilifera*; 4, *Ampelopsis quinquefolia*, *Virginia Creeper*; 5, *Laminium maculatum*. —*H. J. G.* 1, *Alnus laciniata*; 2, *Castanea vesca variegata*; 3, *Alnus imperialis*; 4, *Erigeron speciosus*, probably. —*A. B. T.* 1, *Cattleya Loddigesii*; 2, *Cattleya intermedia*. The difference in the form of the labellum in these species is a very reliable feature. —*C. H., Guildford.* *Begonia Froebelii*. —*R. H. W.* 1, *Fuchsia procumbens*, a good basket plant for greenhouse; 2, *Veronica* species, see next week's issue. —*S. Hedges.* *Hollies*, varieties of *Ilex aquifolium*: — 1,

Handworthensis argentea; 2, *argentea marginata*; 3, *laurifolia aurea*; 4, *Watereriana*; 5, *Lawsoniana aurea picta*; 6, *aurea regina*; 7, *Handworthensis argentea*; 8, *ferox argentea*; 9, *aurea marginata*; 10, *Crataegus Crus-Galli*.

ORPHAN FUND. Mr. H. Bateman is thanked for 3s. 6d. contributed to this fund.

PEAR LEAVES: *H. D.* The leaves are infested with the larva of the Pear Slug-worm, *Selandria atra*, figured in the *Gardeners' Chronicle*, June 2, 1894, p. 703. Dust the trees with quicklime, and repeat the operation several times, for the reason that although the lime will surely kill them if it remains upon their bodies sufficiently long, they are able to get rid of the first application by changing their skin, as do snails. They are not capable of changing the skin twice in a short space of time. Lime-water has been found useful against this pest. Use about 1 peck of lime and 2 lb. of soft-soap to 30 gallons of water, and spray it over and under the leaves before seven o'clock in the morning and after five in the evening.

PLANT REFERENCES: *M. B.* *Lathyrus aurantius*, Koch. We find no mention of this in Boissier's *Flora Orientalis*. *Rosa orientalis* is described at p. 225 of the Supplement to that work—*Calendula*. We do not know where the five species you mention are figured. They are not in Pritzels.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATIONS: *W. S!* Apply to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster.

ROYAL HORTICULTURAL SOCIETY: *H. M.* The yearly subscription of Fellows is from £1 1s. to £4 4s. Apply to the Secretary, whose address already appears in this column.

SHALLOTS OR EGYPTIAN ONIONS: *Station-Master.* Perhaps the following quotation from the *Vegetable Garden*, the English translation of Messrs. Vilmorin's authoritative work, will settle the point:—"In England a large-bulbed, vigorous-growing variety is cultivated under the name of Russian or Large Brown or Large Red Shallot, bulbs nearly twice the size of the true Shallot. The outer skin is of a reddish-brown colour, the inner scales deep violet or purple. Cloves grow in tufts of from three to seven. Leaves erect, 18 inches long, deep green in colour." To make sure, we applied to several of the salesmen in Covent Garden, and append the note we received in reply:—"Unmistakably Shallots, and very fine bulbs indeed; but owing to their unusual size not so saleable as the smaller ones, in so far as the market trade is concerned."

TALLY: *E. C. C. D.* The market tally is a number (sixty), not a weight. A tally of Cabbages would mean sixty heads.

TOMATO FRUIT: *E. Q.* The hard patches in the ripe fruit are due to excess and consequent granulation of one of the constituents caused by lack of potash in the soil. Sulphate of potash should be used in the soil, but not kaint. There is no fungus concerned in the case.

TOMATOS: *Correspondent.* The Tomato-spot, caused by a fungus (*Cladosporium*). Spray the young plants with weak Bordeaux-mixture. Burn the affected plants, and take care that the house is sufficiently ventilated. For green-fly on Smilax, fumigate with XL-ALL, but remember it is a virulent poison.

COMMUNICATIONS RECEIVED.—*J. M. B.*, the paragraph appears to us to be of the nature of an advertisement. We shall be glad to consider any interesting articles.—*J. D.* (the report was too nearly like a catalogue and too long. We will use what is possible).—*M. Grignan*—*S. W. F.*—*E. G.*—*M. Rashleigh*—*Sir George King*—*D. R. W.*—*W. B. H.*—*J. E. J.* (photograph under consideration)—*W. A. C.*—*W. E. G.*—*Protheroe* & *Morris* (next week)—*R. J. A.*—*E. D. R.*, *America-Garden City Pioneer Company*—*F. Davis*—*W. C. & Sun*—*A. D.* (thanks for photograph)—*A Reader-Young Gardener*—*Dodo*—*Evelyn Chapman*—*Expert*—*J. D. G.*—*W. H. D.*—*Leo G.*—*R. Weichsel* & *Co.*—*E. Ward*—*S. W. F.*—*H. A NEW INSECT PEST ON STONE FRUIT TREES.

(GELECHIA NANELLA.)

DURING the past few years considerable damage has been wrought to Apricot, Peach, Plum, and Cherry-trees by an insect which has destroyed the buds by eating out their contents, and so preventing the development of the fruit.

The damage was chiefly noticeable in spring, and at first suggested the presence of the Red Bud Caterpillar; but as the caterpillars of the plague in question appeared on the trees long before the time when the Red Bud grub is usually found, a series of observations was made by the writer with a view of ascertaining the identity of the insect responsible.

The result was that the Red Bud grub was found to be innocent, the damage being due to the ravages of the larva of a small moth (Gelechia nanella), which will probably be found to have a much wider distribution than has been anticipated, especially as the larvæ are so easily introduced to gardens or nursery stock.

This moth belongs to the group known as "Tineina," and to the genus "Gelechia," and although it has been known to science from 1776 or thereabouts, and known in Britain, since 1823, its early life history has remained "a sealed book."

It is possible that, now attention has been drawn to the ravages of its larvæ, many hitherto unexplained failures of fruit which have been

The white marks formed in the leaves, indicating where the tissues have been devoured by the larvæ, are very conspicuous, and it is not unusual

FIG. 68.—GELECHIA NANELLA: LARVA AS SEEN AT END OF MAY, PUPA IN JUNE, AND MOTH ON WING IN JULY. (Magnified)

vaguely attributed to failure of the fruit to "set" or other causes, will be traced to the presence of these larvæ in the buds.

FIG. 69.—LEAF OF APRICOT IN SEPTEMBER, SHOWING MINES MADE BY CATERPILLARS.

The first indication of the presence of the pest is afforded by the leaves, in which the larvæ mine during August, September, and October.

FIG. 70.—SHOOT WITH SECTION OF BUD, SHOWING POSITION TAKEN BY YOUNG CATERPILLAR IN SPRING.

FIG. 71.—SHOOT OF APRICOT IN SPRING, WITH BUDS CONTAINING CATERPILLARS. (A) ruined blossoms; (B) damaged growth buds.

to find a dozen or more in a single leaf. If one of these is opened, the small larvæ will be found feeding at the end of their mines (fig. 69).

The general colour of the caterpillar is reddish or russet-brown, the head and a patch on the first segment of the body being dark brown or

FIG. 72.—SHOOT OF APRICOT IN AUTUMN, SHOWING WINTER HOME OF THE CATERPILLAR AT THE BACK OF BUD. (Magnified)

black. As the time of leaf-fall approaches, the larvæ, which have then attained a length of about 1/8 inch, desert their mines. Many retreat to the twigs, and there form little white silken

cases in the axils of the buds in which to pass the winter (fig. 72). Those larvæ which leave the twigs form their cases either in crevices of the wall or in the folds of the cloth-shreds used to secure the tree. In these cases the larvæ sleep until growth commences in the spring.

Towards the end of February they leave their winter homes, and in sunshine may be seen crawling on the twigs searching for the opening buds. Having made its selection the larva eats its way inside, and from that moment the bud is doomed. The apex of the bud is lined with silk, and in the case of a growth bud it is also bound to the side of the twig with silk. The larva now applies itself to its work of destruction and rapidly increases in size until, by the end of May, when it is full-grown, it has attained a length of about $\frac{3}{4}$ ths of an inch (see fig. 68). When nearly full-grown considerable variation may be seen in the colour of the caterpillars, some retaining the russet-brown colour of autumn, whilst others are pale green. All, however, retain the dark head and mark on the first segment of the body.

The majority of the caterpillars enter the pupa stage whilst still in the bud, and without any further preparation than the lining of the cavity in the bud (by this time reduced to a mere shell) with silk. A few leave the buds, and their pupæ may be found enclosed in silken cocoons in the shreds used in training the trees. The pupæ at first have the head and tip of the body pale brown, with the wing cases and centre of body pale green, but later they become a uniform pale brown.

The moths, which emerge from the pupa early in July, measure about $\frac{1}{2}$ inch across the wings, which are dark grey, very prettily mottled, and streaked with black and white (fig. 68). The extent and density of these markings vary considerably in individuals; but the oblique white line, which crosses the wings near the base, is more or less developed in each.

The moths appear to possess small powers of flight, and pass the day resting on the walls or on the trunks and branches of the trees, where, by reason of their sober colouring and small size, they are easily overlooked (fig. 68).

From what I have said, it will be seen that practically the only time when the insects are conspicuous is when they are mining in the leaves; hence it is advisable to pick off and examine all buds which fail to develop in the spring.

If this insect is responsible for the check, the larva will be found snugly ensconced inside the bud (see fig. 70). It will also be seen that, from the position taken up by the insects, remedial measures are not easily applied. The following have been used with success, and are recommended for dealing with the pest.

REMEDIES.

On the first appearance, in August or September, of leaves marked with pale streaks, indicating that the pest is at work, the trees should be examined, and all leaves found to contain larvæ picked off and burnt (fig. 69). The part of the tree most generally infested is that from 5 to 6 feet from the ground.

Little can be done from October to February, when the caterpillars are resting in their silken cases; but the cloth shreds may be looked over, and any found to contain hibernating caterpillars should be removed and destroyed.

By the third week in February the trees should be sprayed with petroleum emulsion, quassia, or Paris-green, with a view of preventing the caterpillars on emergence attacking the buds.

From this time onward any buds which fail to develop should be picked off and, together with the contained larva or pupa, taken away and burnt.

Finally, early in July, when the moths appear on the wing, a further spraying of the foliage

with one of the solutions mentioned above will assist in preventing the moths from depositing their eggs on the leaves, and so laying the foundation of a future attack.

The latest work on Entomology, speaking of this insect, observes that it is "variously said to feed on the flowers and in the shoots of Pear-trees," but the writer has not yet discovered it on Pear or Apple. In some published lists of fruit-growers' foes it is also given as one of the enemies of the Pear-grower, no mention being made of its ravages among stone-fruits. This will no doubt explain why injury to stone-fruits has been attributed to other sources, and the ravages of *Gelechia nanella* overlooked. *J. T. Houghton, Public Library, Worksop.*

IRELAND.

A GARDEN IN WICKLOW, MOUNT USHER.

[SEE SUPPLEMENTARY ILLUSTRATION.]

(Concluded from p. 82.)

THEN there is the garden in the wood across that beautifully light and fairy-like suspension bridge represented in the supplement to this week's issue. The suspension bridge connects the road entrance or drive down the wood gardens with the house garden, and the wire ropes, as shown in our picture, are draped with *Wistaria* on one side, and *Clematis montana* on the other. There is also another entrance from the Ashford side, with its *Primula-fringed* rivulet, its stepping-stones, with choice flowering shrubs on the grass; and before entering the river, the little brook forms a pool, fringed with marsh-loving plants and semi-aquatic bulbs, such as *Leucojum æstivum*, *Iris*, *Arum Lilies*, &c., flanked with Bamboos, while on its surface float the mottled pads or leaves and exquisite blossoms of some of the best of *Marliac's* coloured *Water-Lilies*.

There are other pools and circular fountains on the walks near the creeper-festooned cottage, in which *Water-Lilies*, *Aponogeton*, *Water Hawthorns*, or *Cape Pond-weed*, *Indian Club*, *Azolla filiculoides*, and other choice aquatic plants thrive.

To see the river-wall covered in March and April with fleece-like masses of purple, crimson, or lilac-coloured *Aubrietia* is a sight not readily to be forgotten. This wall is also furnished with other vegetation, such as *Dianthus*, *Sedum*, double-flowered *Brambles*, and other things. The Californian *Zauschneria* is scarlet in autumn on the sunny wall-face, and its effect, like that of the spring-tide *Aubrietias*, is intensified or enhanced by the reflections in the still water below. In summer, the *Vatry* seems to go to sleep at times on the broads between the weirs over which it falls, foams, or splashes merrily nearly always; but in winter and spring, after heavy rains or snow-storms on the mountains, the peaceful little river becomes a raging torrent, its waters discoloured with mud or peat water; and now and then it has tried to rise above the protecting wall and invade the walk and garden. Despite its force, however, there are some plants quite naturalised on the great rocky stones and boulders that occupy its bed, such as the great Californian *Saxifrage*, and two or three of the Japanese *Knot-weeds* or *Polygonums*, seen in the middle distance of our picture. The riverside trees which shade the river banks and the hardy *Ferns* in the old mill race are here very quaint and beautiful, consisting of a Spanish *Chestnut* with a splendid gnarled bole or trunk, groups of wild *Cherries*, *Hawthorns*, *Oak*, *Ash*, *Sycamore*, and *Beech* and *Alder*, still further afield. The point of view is just as, passing the cottage, the river vanishes into cool and shady pools beloved of the spotted trout and the white-breasted dipper or water-ouzel, which haunts the place, and may be seen dashing like lightning through the fringes or

curtain of a water-fall on the pond-overflow race near the house, behind which is ensconced the nest and its eggs or young. Even the lordly salmon nests and spawns in the gravelly bed of the tail-race here—a sight rarely seen in a garden!

In the cool of the evening, after hot summer or autumnal days, the mist hangs over meadow and river alike, and you may see the great grey herons rise from their fishing haunts beside the river, and float away to their roosting-places in the woods, like ghostly visitors from another sphere, or a flock of curlew pass seawards with their plaintive cry, and hear the wood pigeons coo and croon their last "Good-night," as the sunlight dies away.

The place is a haven of peace and rest, sacred to friends and flowers, to bird life and books, and to simple and genial hospitality. Even a soaking wet day—and it can rain in Wicklow—may be spent here with delight amid the selection of books, the pictures, the quaint bits of old Chelsea, varied by peeps through the window at the flowers and the birds or squirrels getting luncheons off bones or split *Cocoa-nuts*, or other suitable provender especially arranged for their benefit on the grey and lichen-embroidered branches of a great *Pawlownia-tree*.

To attempt to name even a tithe of the plants of all kinds that flourish here would be impossible, even if likely to serve any useful purpose, but they are all numbered with zinc tallies and duly entered in the books of plant life religiously kept. This system of labelling is practical, tolerably simple and efficient, without being obtrusive or conspicuous enough to destroy the charm of the plants themselves or the garden as a picture. You may see here the *Maples* and tree *Pæonies*, and the fertile hardy *Palms* of both sexes, and the hardy shrubby grasses, or Bamboos, nestling tall, though they be beneath the still taller *Ti trees* or *Cordylines*; as also the *Veronicas*, *Pittosporums* of New Zealand and Australasia, and *Sophoras* from China.

The purple-flowered *Potato-tree* (*Solanum crispum*) and its elegantly habited first-cousin, *S. jasminoides*, *Fremontia*, *Mandevilla suaveolens*, *Pomegranate*, *Myrtle* and *Oleander*, choice *Abelias*, *Spiræas*, many *Rhododendrons*, *Zenobias*, *Andromedas*, and other ericaceous plants all flourish here in profusion. In autumn the best varieties of *Hydrangeas*, blue, rosy, and white, are very luxuriant and showy in the wood garden and elsewhere. *Tricuspidaria* forms a bush eight or more feet high and ten feet wide, and bears hundreds of its pendent red cherry-like flowers amongst its dark and glossy leaves.

The scarlet *Tropæolum speciosum* covers wall and bush, *Cydonia*, *Cotoneaster*, *Roses*, and dark *Ivied screens*, with its tender foliage and bright scarlet flowers, followed in autumn by a profusion of its crimson-purple calices set with turquoise-blue berries. Two of many plants which succeed here better than I ever saw them elsewhere are *Cypella Herbertii*, four feet high and five feet across, simply a great spreading sheaf of leaves and flower-spikes. The other is *Dierama* (*Sparaxis*) *pulcherrima*, with dainty spikes "like fishing-rods for fairies," five to seven feet high, elegantly pendulous at their tips, and each branchlet hung with bells that vary in colour from dark velvety crimson-purple to almost snowy-white. All the phases between the two so-called species, viz., *D. pendula* and *D. pulcherrima*, occur here from home-saved seed; and yet we are told that at Dunran, a quaint old place above *Mount Usher*, this plant is even still more luxuriant and charming when grown from seed.

The wood-garden, rich in *Phloxes*, *Lilies* of all the best species, *Hellebores*, *Tea* and other *Roses*, *Bamboos*, *Spiræas*, *Meconopsis*, &c., with its choice inner circle round a *Water-Lily-pool* of

Trillium, Anemones, Primroses, Shortia, Galax Ourisia, Parachætus, choice Camellias, and ericaceous plants is luxuriant and charming beyond words to say. Here again Cordylines, Bamboos, Abutilons, Cornus capitatus, and other rare shrubs abound, and we have never seen more brilliantly coloured beds or borders of St. Brigid Anemones than those grown here. In spring the grassy lawns are gay with Crocus, Dogs-tooth Violets, Bluebells, with circles or masses of hardy Cyclamen at ground level around the boles of the trees; and masses of Narcissi of many and varied kinds flutter in the soft breezes or rude gales—in the sun or rain of blustering March or of showery April.

You may visit Mount Usher any day in the whole year and never find it without flowers and healthy greenery. There are many good gardens in Wicklow, including Powerscourt, Kilruddery, Bellvue, Delgany, Dunran (with its castle near the centre of a circular walled-in garden with great Yew-trees and Yew and Laurel hedges, its trees, shrubs, and splendid scenery)—but there is only one Mount Usher, in the sheltered and happy valley of the Vartry, as it flows down from the celebrated Devil's-glen a mile or so away. It is an ever-charming focus spot of beauty—soil, shelter, fine aspect or position, variety of surface, ample water-supply, and a genial climate; but the great factor of all is the personal equation, viz., that of the genial owners, the Messrs. Walpole, makers of the place, of what may be called the overflow of their wealth, ability, energy, and leisure for an extended period of busy years. Not only has this garden been to them a source of personal enjoyment, but they have extended the pleasure it has constantly afforded them to hundreds of other people fond of horticulture, as the book signed by visitors amply shows. Our illustrations speak for themselves, and are from photographs taken by Mr. Geo. E. Low, who is himself a keen amateur gardener. *F. W. Burbidge.*

KEW NOTES.

VIEW IN THE PALM-HOUSE AT KEW.—The Palms at Kew are a source of interest and delight to all kinds of visitors, many of the specimens in the large Palm-house being almost equal in size to what they attain in a wild state in the tropics. When they reach a height of 60 feet or so they have to be sacrificed or they would soon push the roof off. A large sacrifice of this nature had to be made three years ago, and the view shown in the illustration (fig. 73) is from the gallery overlooking the younger Palms which replaced the giants then cut down. The fan-leaved Palm in the centre of the view is the Bermudan Sabal Blackburniana, no doubt the oldest Palm in England, as it was probably introduced by Admiral Bligh in 1793, and is therefore 110 years old. It is in vigorous health, and produces regularly large crops of Grape-like fruit. To the left is Howea (Kentia) Behmoreana, the first of its kind to be introduced from Lord Howe's island, it having been in the Palm-house fifty years. The plant flowers almost every year.

GERARDIA HYBRIDA.

A plant bearing this name is now in flower in the Pentstemon bed in the herbaceous ground at Kew. It was obtained last year from the curator of the Botanic Garden at Giessen, Herr F. Rehnet, who wrote an account of it, published with a figure in *Die Gartenwelt* for November 9, p. 99. The origin of the plant is said to be Pentstemon campanulatus crossed with Gerardia tenuifolia; but there appears to be some mistake here, as careful comparison shows that the supposed hybrid is simply a form of Pentstemon campanulatus, a most variable species. Probably the mistake arose from accepting as Gerardia tenuifolia a plant figured in *Illustration Horticole*,

1894, p. 159, under that name and since grown in Continental gardens, but which is a narrow-leaved, small-flowered form of the Pentstemon. Gerardias are mostly parasitical and of little or no value in horticulture.

LYSIMACHIA HENRYI.

There are two fine examples of this new Loosestrife now covered with flowers at Kew—one in the rockery, and the other in the herbaceous garden. They are cushion-like tufts a yard across and 4 inches high, formed of interlacing prostrate stems which ramify freely and root as they spread. The leaves are oblong, 2 to 3 inches long, dark green, and the flowers, which are in crowded heads all over the plant, are campanulate, $\frac{3}{4}$ inch long, bright yellow, and lasting. Judging by its behaviour this year, this plant ought to prove useful in many places in the garden, as it grows very freely and is evidently quite hardy. In some respects it resembles *L. paridiformis*,

but from some cause or other it has never revealed its true characters until this year. Probably the excessive wet and other peculiarities of weather experienced at Kew this season have suited the Kirengeshoma; at any rate it has made strong stems 2 feet high, robust dark green lobed leaves resembling those of Cineraria cruenta, and terminal panicles of bell-shaped, cream-yellow flowers nearly $1\frac{1}{2}$ inch long; the corolla composed of five overlapping oblong acuminate fleshy petals, somewhat recurved and free above, and so closely folded below as to appear united. A good idea of the plant may be got from imagining an ordinary Cineraria with flowers suggesting a Campanula. Prof. Yatabe, who is the author of the genus, says it is allied to Hydrangea and Philadelphus, and that it is a native of woods on Mount Ishizuchi, at an elevation of 5,000 feet. A figure of the Kew plant has been prepared for publication in the *Botanical Magazine*.

FIG. 73.—VIEW IN THE PALM HOUSE, KEW, AS SEEN FROM THE GALLERY IN MAY.

raised and flowered at Kew about ten years ago from seeds sent by Dr. A. Henry from Ichang, and of which a figure was published in the *Botanical Magazine*, t. 7226; but *L. Henryi* is quite prostrate in habit and has much smaller leaves. Dr. Henry discovered this new introduction, and it was named after him by Mr. Hemsley some years ago; but we owe the possession of living plants of it to Messrs. Jas. Veitch & Sons, for whom it was collected in China by Mr. Wilson.

KIRENGESHOMA PALMATA.

A brief description of this plant, taken from the Japanese *Botanical Magazine*, was published in the *Gardeners' Chronicle*, February, 1891, p. 202. In the same year Dr. R. Yatabe, of the Botanic Gardens, Tokio, Japan, sent seeds of it to Kew, and from these a single plant only was raised. This has been grown for ten years or so in a rather moist, sunny position in the rock-garden, and it has now and then made an attempt

ADENOPHORA POLYMORPHA.

A fine form of this is now flowering in the rockery at Kew. It is one of the plants collected in China by Mr. Wilson for Messrs. J. Veitch & Sons, to whom Kew is indebted for the example under notice. The stems are 5 feet high, branched, and clothed with numerous rich dark blue bell-shaped flowers an inch long, with acute corolla lobes and long narrow sepals. The species is, as the name denotes, very variable, some forms of it having small unattractive flowers. The present one may be compared with *Campanula Trachelium*, so far as general effect goes. It is quite hardy. The genus, which is scarcely known in gardens, comprises about a dozen species, and it belongs to the same group as *Ostrowskia*, *Symphandra*, and *Campanula*.

ACONITUM FISCHERI.

This is a rare plant. The figure in the *Botanical Magazine* under this name is, according to Dr. O.

Stapf, true *A. japonicum*, of which *A. autumnale* is a synonym. What is accepted at Kew as the true *A. Fischeri* may now be seen in flower in the collection there. It is three weeks or a month earlier than *A. japonicum*, of which there is a large bed at Kew, strong and full of flower-buds, and it also differs in the flowers being smaller and of a very dark purple-blue colour. It is decidedly a plant worth looking after for autumn effect. What is supposed to be a third species of the same group was introduced by Mr. Wilson from China, and will shortly be distributed by Messrs. J. Veitch & Sons as *A. Wilsoni*. According to Sir Joseph Hooker, upwards of three hundred specific names have been advanced for probably not more than thirty species of *Aconitum*! *W. W.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA GASKELIANA.

MR. ARTHUR COBBOLD obligingly sends us a flower, in which the upper or dorsal sepal is attached to the back of the column. As the vascular bundle which supplies the stamen that is opposite to the sepal starts originally from the same bundle as that which supplies the sepal, the malformation becomes intelligible.

EULOPHIA PEETERSIANA

is the subject of an attractive coloured plate in a recent number of the *Revue Horticole*. This is, according to Mr. O'Brien, the *Grammatophyllum Roemplerianum* of Reichenbach, in *Gardeners' Chronicle*, 1877, p. 240. We shall have to wait till 1914 before the herbarium of the eccentric Professor can be consulted in order to obtain confirmation of this opinion.

CATTLEYA × PATROCINII, "WESTFIELD VARIETY."

A very fine improvement on the original form of this interesting plant is now in flower in the collection of Francis Wellesley, Esq., Westfield, Woking (gr., Mr. Hopkins). The original plant was recorded in Brazil as a natural hybrid of *C. Loddigesii* and *C. guttata leopardina* (? *Leopoldii*) in 1890, and the same year a similar plant flowered in several European gardens. More recently it has appeared in other places, a very good form of it having been figured in the *Dictionnaire Iconographique des Orchidées*. Mr. Wellesley's variety is, however, much finer, notwithstanding the fact that the inflorescence bears six flowers. The flowers, which are over 4 inches across, are shaped like those of *C. Leopoldii*, except that the undulated and extended side-lobes of the labellum seem more continuous with the front lobe than in that species. The sepals are of a bright rosy-mauve colour freely spotted with reddish-crimson, the spotting being smaller at the backs of the segments than on the face. The labellum is clear rose-colour with a white base, and a darker rose hue in front of the stout white column. The crimped edge of the labellum also has a white margin.

Much confusion has been caused by classing *C. Leopoldii* as a variety of *C. guttata*. *C. hybrida* (typical *C. guttata* × *Loddigesii*) was raised by Messrs. Veitch nearly half a century ago, but that *C. Patrocinii* was a cross between *C. Leopoldii* and *C. Loddigesii* seems to be proved by the plant raised by M. Maron from that parentage and named *C. × Gaudii*; and further confirmation is given by Mr. Ed. Kromer, the collector, who informs me that he knows that the few original plants of *Cattleya × Patrocinii* were collected at Santa Catharina, where *C. Leopoldii* and *C. Loddigesii* grow together. The smaller and botanically different *C. guttata* he says is common even in the harbour of Rio de Janeiro, but not in Santa Catharina. *J. O'B.*

TROPICAL FRUITS IN ENGLAND.

It is stated that we are about to receive a large and regular supply of Mangos; those who love them may well exclaim, "At last!" Why this most delicious of the common tropical fruits has not been familiar in Europe for years was always a puzzling question for those who thought upon the matter. Botanists agree that India was its native home, because all the various names current in the East, or all which have no reference to its characteristics, can be traced to the Sanscrit. But even before the arrival of Europeans it was very widely spread, and they conveyed it to all their settlements. The Spaniards introduced Mangos to the Philippines in the sixteenth century, and Chinamen trading there, appreciating the novelty, carried the seeds home. The Dutch planted it in the Moluccas as early as 1655, and pirates, as the legend goes, transported it to Zanzibar and Madagascar. At the present time one would have to search far for an island in the Eastern or the Western Tropics where the Mango does not flourish. It has reached Egypt, for M. de Lesseps used to present his friends with some of the highest quality, grown at Ismailia. But hitherto there has been no regular export to Europe, and the small parcels that arrived mostly belonged to those villainous species which taste of turpentine. For there are Mangos and Mangos, ranging from varieties actually uneatable, through those which have a disagreeable "smack," more or less, to the perfection of "Bombay No. 9," and it is the former mostly which were distributed in old times; but some authorities of experience assign the bad flavour, as a rule, to soil or conditions unsuited to the tree. However, the good sorts are so common nowadays that we ought to have had the fruit in abundance ever since "cold storage" was introduced. Trinidad has come to the rescue. Such a large consignment is on the way that 400 boxes sent by special train to Covent Garden as soon as the vessel arrives will be only a first instalment. It is added that the fruit will be sold at "popular prices." If Mangos become an ordinary object on our dinner-tables persons of an ingenious turn will find an opportunity to distinguish themselves. A machine or apparatus for eating the fruit with comfort and decency has been a "felt want" for ages. In India they say that one can only enjoy it in the privacy of the bath, where no spectators can be disgusted by the process and no clothing can be spoiled. It must be admitted that there is a good deal of truth in this statement. The prettiest woman eating Mangos in public is a distressing sight for the fastidious, and the juice leaves a permanent stain. But it is certainly not beyond the resources of science to devise a neat little holder which should enable us to consume the precious thing without inconvenience to ourselves or others.

Several brand-new fruits have been discovered lately, besides the hybrids which enterprising gardeners have produced. In the country of Boma, behind Fashoda, Captain Welby found one which none of the people with him recognised. The tree resembled a Cherry, but the fruit was a "natural jam"—flavour not mentioned. "It came in handy for breakfast." In the same unexplored district he came across another, like an Orange, "the inside a mass of large pips covered with a yellow pulp." It was pleasant enough to eat, but wanting in taste. The account in each case suggests possibilities for the future. The common fruits, Apples, Pears, Plums, Cherries, were unpromising in their original forms. When the Gordon College at Khartoum has turned out native gardeners skilled in Western science, they may make something of their local produce. But it seems that Matabeleland possesses fruits which need no improvement. Half a century ago Livingstone discovered a curious nut called Maneko, the seeds of which are covered with a glutinous fibre, chewed by the natives, but not swallowed. Livingstone agreed with them that it was delicious. We are not aware that the Maneko has been noticed since that time, but lately it was discovered in Matabeleland. Another novelty is the Inhlada, a name meaning "famine fruit" in Zulu, because, they say, a little goes so far that in time of dearth many lives are saved by it. The nut, bigger than the largest Orange, contains an acid pulp in flavour like roasted Apples, much appreciated by the white colonists, who find the Zulu report quite correct—two of these nuts make a meal. Then there is the Marula, much like a Green Gage in taste, but the pulp is replaced by a syrup; and an unnaamed fruit, resembling an Apple in all respects. All these curiosities would grow in Southern Europe probably, and if they come up to the descriptions they may be introduced before long. It is well to recollect, however, that pioneers in Matabeleland would be apt to find anything in the way of fruit which was not bad delightful. But in the tropical countries of either hemisphere, besides the many species cultivated, an intelligent caterer often serves a dish of fruit which he cannot name. The bazaar people told him perhaps, but he never heard the word before, and he cannot remember it. These are "jungle fruits," always small, and nearly always delicious. Perhaps at some future day they may be cultivated. A traveller in Costa Rica once sent his servant to buy fruit in the market, and the man

brought back five species, all resembling the Medlar in taste, though utterly different in form, and all agreeable. No one at the hotel could name any of them.

But it is not creditable to the enterprise of our business men that scores of fruits common and valued in the European settlements have never been sent home. The explanation always offered is that nobody would buy them. The first consignment might be a loss; but it is not likely that, when people strive so hard for something new in their entertainments, such exquisite fruits as the Duku and the Rambutan—to name only two, almost as common in the Malay countries as Apples are here—would not sell. The true reason is want of enterprise—nobody has thought of it.

Of course most of these products would not bear the journey in former days; Mangosteens, which are so commonly pronounced the best of all, will not bear it now, they say. We should feel more confident on this point if assured that the experiment has been tried more than once on a large scale. Hundreds of people, no doubt, have bought some Mangosteens in the market, carried them aboard, and obtained permission to store them in the cool chamber—where they promptly decayed. But this is not business. There are so many legends about this queen of fruits, mostly unfounded, that one who is familiar with them may well doubt. Until a very recent date, it was an article of faith unquestioned that the Mangosteen would not live, much less fruit, beyond the charmed border of the Straits Settlements and Malay kingdoms adjoining. There was one striking piece of evidence to the contrary, no doubt.

The Duke of Devonshire, so famed for his devotion to horticulture, planted seeds of the Mangosteen at Chatsworth, and actually obtained two trees. They grew and grew for something like forty years. At length each bore a single fruit. One the Duke presented to Her Majesty, and one he ate himself. Next day the trees were cut down. But such a case did not affect the rule. A circumstantial story told how the Dutch authorities even of Java had spent much money in efforts to acclimatise it—always vain. And forty years ago it was true probably that no specimen could be found outside the limits given—because everybody supposed that it would be useless to make the attempt. But somehow the charm got broken, and now Mangosteens are flourishing from Bombay to the Philippines—not very fruitful yet, but that is because they are too young probably.

This, however, is the delight of epicures and persons of cultured taste. The vulgar, white or yellow, prefer Mangos and Durians; but as for the latter it must be added that many persons of the utmost refinement enthusiastically support the opinion of the populace. Durians could always have been imported without difficulty; with fair treatment they would sail round the world undamaged. We shall never see them at Covent Garden, notwithstanding—which is a bitter thought to many estimable persons who have served their Queen and country, or maintained the dignity of British trade, in the Far East. If a waggon-load of Durians passed through the streets of London unannounced, all the sanitary inspectors *en route* would turn out in panic, and the Borough Councillors might be summoned for a special meeting. Such is the awful smell of this fruit, which tastes, as its raving lovers declare, like nuts and cream. Personally, we should add, while admitting this flavour, a taste of Onions too strong for our palate. It may be asked how Europeans contrive to enjoy a fruit which for those who do not worship it is as disgusting as an open drain, and the stench does not pass away for hours. Both ladies and gentlemen form Durian Clubs. Each member in turn entertains the rest, and so the nuisance is distributed. *Standard*. [It was the Duke of Northumberland, at Syon House, who first fruited the Mangosteen in England. See *Gardeners' Chronicle*, June 2, 1855, p. 371. ED.]

REMARKS ON THE CONDITIONS OF THE FRUIT CROPS.

(See *Tables, ante, pp. 72—77.*)

(Concluded from p. 174.)

IRELAND.

GALWAY.—All small fruits were good, especially Strawberries. The "Leader" I find an excellent fruit, both firm in texture and of a bright colour; Laxton's Fillbasket is an excellent cropper. *And. Porter, Woodlawn Gardens.*

LONGFORD.—Small fruits and Strawberries were very good in this neighbourhood; Pears and Plums few, and Apples a total failure. For twenty-five years our orchards have not been so destitute of fruit. This is owing to the cold sunless season of last year, consequently the young wood did not mature. *John Rafferty, Castleforbes, Newtownforbes.*

SLIGO.—The blossoms of Apples, Pears and Plums were destroyed by frosts in April and severe winds in May. Strawberries have been

very good, particularly Fillbasket, which has been by far the most prolific variety here; Mentmore and Trafalgar also gave a good account of themselves, but such new sorts as the Laxten and Climax have been rather disappointing. *Joseph Sangster, The Gardens, Lissadell.*

LIMERICK.—The promise of good crops of fruits was very good here in spring, but the frosts during April destroyed all. The frosts were as

wooded fruit. Of Strawberries the show of bloom was excellent, but owing to cold damp weather when the fruit was taking colour, large quantities rotted on the plants, the variety Royal Sovereign especially so. *C. Smith & Son, Caledonia Nursery, Guernsey.*

JERSEY.—Again have frost and cold winds blighted the hopes of growers. A few Pears have escaped, but Chaumontel alone shows a fair crop,

CATTLEYA × PITTIANA, "J. WILSON POTTER'S VARIETY."

The first plant to flower of this fine hybrid between *Cattleya granulosa* Schofieldiana and *C. Dowiana aurea* was in the collection of H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), and it was recorded in the *Gardeners' Chronicle*, August 9, 1902, p. 95. At the Royal Horticultural Society's meeting on September 1, J. Wilson

FIG. 74.—CATTLEYA × PITTIANA, "J. WILSON POTTER'S VARIETY."

follows: — on the 2nd, 2°; 12th, 2°; 14th, 7°; 16th, 8°; 17th, 8°; 18th, 7°; 19th, 2°; 22nd, 6°; and 24th, 5°. The wind was generally from the north. The rainfall for the month was 1.68 inch. *W. Bowles, Adare Manor Gardens, Adare.*

CHANNEL ISLANDS.

GUERNSEY.—Fruit trees generally this season flowered very early, indeed, too early to allow of a good set of bloom, which was probably the result of last summer, which failed to ripen the wood sufficiently. This applies to all hard-

and much of the fruit is badly marked by hail. Williams' Bon Chrétien has been particularly ravaged by small grubs, which appeared in hundreds in each fruit, hollowing it completely. Most growers were wise enough to pick and burn the affected fruits. This trouble has not been noticed here before. Apple-trees are showing Ermine-moth caterpillars again, but rather fewer than last year. Strawberries suffered much from extremely wet weather. Tomatos are largely grown again out-doors after Potatos. *H. Becker, Casarean Nurseries.*

Potter, Esq., Elmwood, Croydon (gr., Mr. W. H. Young), showed another variety of the same parentage, and was accorded a First-class Certificate.

The flower of Mr. Pitt's plant was 7 inches across, and of exquisite tinting, the cowslip-yellow sepals and petals being delicately tinged and veined with rose, and the centre and base of the labellum showing the rich gold veining of *C. Dowiana aurea*.

Mr. Potter's variety (fig. 74) partakes more strongly of *C. granulosa*, and its bronzy-yellow sepals and petals tinted with rose are of darker

hue than the original variety. The labellum has orange-coloured marking in the centre, the front being purplish-ruby-red, the fimbriated margin blush-white. It is a very handsome flower, and the plant was cultivated to its best, but the flowers when exhibited were scarcely of full size. *J. O'B.*

THE ROSARY.

ROSE ZÉPHYRINE DROUHIN.

At last we have got on to the right track, and have been informed of the proper way to spell the name of this Rose. For this information we are indebted to M. Mottet, the author of a serviceable little book on Conifers and a frequent correspondent of the *Revue Horticole*. In that publication, in the year 1899, at p. 308, we find that this Rose is called in Switzerland Charles Bonnet; in England, Madame Gustav Bonnet; in Germany, Zéphyrine Drouhin; in Italy, Ingegnoli prediletta; in France, Zéphyrine Druot, Drouot, and Drouhot. At any rate gardeners must not rail at botanists for multiplying synonyms, for they are much concerned with glasshouses themselves.

Rose Zéphyrine Drouhin, as we must now call it, was raised by M. Binot, of Dijon, in 1873. M. Binot dedicated his Rose to Madame Zéphyrine Drouhin, the wife of M. Drouhin, a gentleman attached to horticultural pursuits residing at Semer (Côte d'Or). It is a hybrid Bourbon climbing Rose, almost destitute of thorns, and with the beautifully-coloured and deliciously-scented flowers to which we have already alluded. M. Mottet tells us it is exceptionally hardy, producing its flowers singly or in clusters of ten or twelve all the summer till checked by frost. It is easily propagated by cuttings or by budding. On September 7th we received a box of lovely blooms of this Rose from Messrs. Jas. Cocker & Sons, Aberdeen, who have cultivated the variety for some years. It is cited in their catalogue for last year as "Zepherin Drouot." The richly-coloured fragrant flowers are exactly the same as those described in our issue for August 22, p. 134.

FOREIGN CORRESPONDENCE.

PARIS.

FLOWERS AT FUNERALS.—For some years past there has been a tendency in Paris, owing to the excessive extent to which the practice has been carried, as elsewhere, to request that no flowers or wreaths should be sent on the occasion of a death. As this custom becomes more popular it will entail considerable loss on the florists. A member of the Société Nationale d'Horticulture who lately died left a request that no flowers should be sent, and as if to compensate for the loss to trade bequeathed a thousand francs to the Society above named. On the same principle it has lately been usual in Brussels to insert in the newspapers notices to the effect that New Year cards will not be sent by certain persons, who give to the poor the amount they would otherwise spend on cards. This generosity does not affect the tradesmen whose business is thus curtailed.

The Cours la Reine Hot-houses.—The large glass-houses erected at Cours la Reine, by the borders of the Seine, for the 1900 exhibition are not yet permanently occupied. The Société Nationale d'Horticulture make use of them in May and November for their flower-shows; otherwise the buildings remain practically unused. The authorities of Paris naturally hesitate to maintain these costly erections for occasional occupation only, and have offered them to the Society

for 10,000 francs a year. The Society would willingly hold meetings in the buildings, but could only do so four or five times per annum, and are asking for a less heavy rental. Probably a suitable arrangement will be made as the authorities do not wish to pull down the houses, and the Society hopes to get larger attendances at their shows. At the meeting on August 27 some fine Gladioli were shown by MM. Vilmorin-Andrieux, and M. Graveriau; Chrysanthemums by M. Lionnet, and there were other good exhibits.

Schomburgkia-Cattleya.—At the last meeting of the Société Nationale d'Horticulture de France M. Dallemagne, of Rambouillet, staged a new and interesting Orchid, a hybrid between Schomburgkia tibicinis and Cattleya Mossiæ, and which he has named Schomburgkia-Cattleya striata ×.

The habit of the plant is intermediate; the pseudo-bulbs are rather short, swollen and striped, and bear two leaves at the summit; the flower-stem is rather short, and bears five flowers. These flowers are very large, at least as large as those of *C. Mossiæ*, the petals and sepals are not wider than those of Schomburgkia, and are rolled round like those of *Cypripedium Parishii*, they are of a fine bright red colour tinged with magenta; the lip recalls strongly that of Schomburgkia, but the lateral lobes enclose the column, the base is white, and the anterior lobe is bright red. I believe it to be the first hybrid obtained between a Schomburgkia and a Cattleya. *G.*

The Week's Work.

THE ORCHID HOUSES.

By H. ALEXANDER, Orchid Cultivator to Capt. G. L. HOLFORD, Westonbirt, Tetbury.

Odontoglossums.—Since the introduction of leaf-soil into the compost used for *Odontoglossums* there has been a marked improvement throughout the country in the quality of the flower-spikes produced and in the health of the plants in general. Yet some growers still stick hard and fast to the old compost of peat and sphagnum-moss, and no doubt obtain favourable results. It is also true that large quantities of *Odontoglossums* are killed yearly through being potted in fine leaf-soil and carelessly watered by inexperienced men. At Westonbirt, leaf-soil has been used in the potting mixtures for the last two years with very satisfactory results, the quality of the flower-spikes produced being much superior to those produced in the old compost.

Potting the Plants.—The present month is without question the most suitable time for the general overhauling of such plants as *O. crispum*, *O. Pescatorei*, *O. triumphans*, *O. Halli*, *O. luteo-purpureum*, &c., for at this season the majority of the plants have started well into growth, and will therefore quickly make new roots, which will take hold of the rooting medium now afforded them. But there are always some plants that remain dormant longer than others, and these may not be ready for potting until early spring. Leaf-soil should be used as follows:—Good Oak-leaves or Belgian leaf-soil two-fifths, turfy peat two-fifths, clean chopped sphagnum-moss one-fifth, adding a good sprinkling of silver-sand and finely broken crocks. Let the material be well mixed together, and use it in as rough a state as possible. Over-potting must be avoided with strictest care. It is a mistake to put a plant into a pot large enough to accommodate it for two or three seasons' growth. Select smaller pots that will afford room sufficient for the extension of the roots in one season, and when these have become filled with roots, shift on the plants without disturbing the ball. If the repotting be done in this manner, affording water is not so difficult or dangerous during the winter months, as the rooting medium dries much quicker. Such plants may be potted on for two or three seasons as the pots become filled with roots, but after this time it will be best to shake the plants out, cleaning away all old material from the roots and removing

old useless pseudo-bulbs. The plants should then be started again in small pots as before. Before re-potting put a layer of bracken-roots or clean crocks in the bottom of each pot for drainage, and in the course of potting press the material moderately firm about the roots. Keep the base of the plants on a level with the rim of the pot, and cover the surface with a neat layer of fresh sphagnum moss. After the operation the usual care will be needed in regard to watering, and special attention must be given to keeping the atmosphere sweet and moist by careful damping and ventilating. Prevent cold draughts, and whenever the weather permits spray the plants over-head with water.

THE HARDY FRUIT GARDEN.

By CHAS. PAGE, Gardener to J. B. FORTESCUE, Esq. Dromore, Maldenhead.

Gooseberry and Currant Bushes.—It is a good practice to thin the growths of the present season; and if the bushes were disbudded in the spring, very little will need removal at the present time. The case is different if the shoots were allowed to grow unchecked, and the free-growing varieties will have formed thickets of shoots. In this case let all the small, twiggy growths be removed entirely, and the stronger ones thinned out, but leaving a sufficient number to allow of a final thinning being carried out in the spring. Black Currants do not make so much wood as the red and white varieties; but in the case of young and vigorous bushes it will be well to go over them, removing badly-placed shoots.

Cordons of Gooseberries and Currants trained on north walls should have the nets removed as soon as all the fruits have been gathered, the shoots being then thinned, as advised in the case of bushes. The weather is now much drier, in the south of England at least, and gardeners have been enabled to ply the hoe in keeping down the weeds. Experience has taught me that the hoe is an important tool in the cultivation of hardy fruit, the growth of the roots of fruit-trees being encouraged by the surface of the soil having a fine tilth, and they derive more benefit from manure when this is applied to the surface than by digging it in after the trees are planted.

Hints on Work in General.—Such early varieties of culinary Apples as Grenadier, Lord Grosvenor, and Keswick Codlin, are now fit to gather, and in so doing go over the trees several times, gathering only those that will part readily from the shoots by a slight upward movement. Stored in a cool room these early varieties will keep sound for some weeks, and with the short crop of many late kinds they will prolong the season. Where the gardener is fortunate enough to have a crop of Williams' Bon Chrétien Pear, a few fruits should be gathered at short intervals and placed in a cool vinery to ripen.

PLANTS UNDER GLASS.

By J. MAYNE, Gardener to the Hon. MARK ROLLE, Bickton, Budleigh Salterton, Devonshire.

The Plant Stove.—As the season wanes, less shade and moisture should be afforded in this structure, so that the growth of the plants may become harder before winter. Such plants as Allamanda, Stephanotis, Clerodendron, Bougainvillea, Gloriosa, that are passing out of flower, may be afforded less water at the roots, and be placed at the cooler end of the house if it be convenient to remove them. If painting is to be done to the interior of the house, September is a good month to undertake the work, as the plants may with safety be taken to unheated houses and pits for a few weeks. In any case the glass and wood-work should be well washed down with warm soapy-water, as filth always accumulates where much heat and moisture are employed. Let all the plants be cleaned and the pots scrubbed before returning them to the house.

Euphorbias.—*E. pulcherrima* and *Jacquinaëflora* standing in cold pits or frames must soon be transferred to a slightly warmer atmosphere, or they will be liable to lose their bottom leaves; and be careful not to over-water them. Both species require to be stood near the glass-roof, the latter doing best when the growths are

trained to pieces of string or wire. A night temperature of 60°, with plenty of ventilation during bright days, will be suitable, and no shade whatever need now be afforded them. If stimulants be given, let the application be weak, or it will injure the roots.

Schizanthus.—These are very showy subjects for the greenhouse during early spring, especially the newer strain "Wisetonensis." Sow seeds in pans of light sandy soil in a cool structure and afford shade until the seedlings are through the soil. Prick them off as soon as they are ready into 48-size and small 32-size pots, in which they will flower. The compost may consist of turfy-loam and a little leaf-mould and manure, with a sprinkling of sand. Place three and five plants respectively in each pot, apply water and shade for a few days. When the plants have become established stand them on a shelf in a freely ventilated house. The growths will need to be supported by neat stakes. Early in February a little feeding may be commenced.

General Work.—The time is fast approaching when fire-heat will have to be employed, if not to keep out frost, to dispel damp, therefore examine the heating apparatus, replacing with new any parts that may have become useless. Have all flues and chimneys swept, and the boilers and water-pipes emptied of all sediment, which, if left in them year after year, tends to corrode the iron and prevents the free circulation of water.

THE FLOWER GARDEN.

By J. C. TALLACK, Gardener to E. MILLER MUNDY, Esq., Shipley Hall, Derby.

The Backward Season.—The present year has not been a good one for flower gardening, most plants being late in blooming, the result of cold nights almost throughout the summer, as well as sunless days. Of rain, we have had no excess at Shipley. It is a pleasing fact that the weather conditions have not affected injuriously the later-flowering Michaelmas Daisies, Rudbeckias, Pyrethrum uliginosum, and some other late autumn-flowering plants; and given a fine September, the display will be excellent. A few of the earlier-flowering herbaceous perennials have been retarded by the weather. Aster amellus is just now opening its flowers; Rudbeckia Newmanii is in its first flush of bloom; and the shrubby Phloxes raised from cuttings are now affording a nice display, in succession to the old stools, which are past their best. In spite of the backwardness of many kinds of plants, there are some marked successes to record, notably Violas, which have flowered freely, and still continue to flower. A few of the best that I grow are Mrs. C. F. Gordon, Acushla, Pembroke, Bridegroom (an improved Isobel), and Diana. The last-mentioned is, and has been, very fine, and has proved itself a most useful bedding Viola, large flowers, habit good, and in the mass forming a cloud of delicate mauve colour. Many of the early-flowering Chrysanthemums will be late, and in some cases they will probably scarcely reach their best this year; but the Marie Masse varieties, the small-flowered yellow Flora, and Market White are all that one could wish, being clean in growth and adorned with numerous flowers and flowers-buds. Sweet Peas have been fine and the flowers extra large, the recent rains giving them a new lease of life. Carnations have been good, and they are still in flower. The buds of Liliun auratum have suffered much from the weather, and the flowers are not really good; L. a. platyphyllum is the best form out-doors. Tuberos-rooted Begonias, which form good contrasts with zonal Pelargoniums, are now at their best, the rains not injuring them; Lobelia cardinalis has done well, and the variety Firefly has again shown its superiority to L. c. Queen Victoria. Montbretias are fine; and Pentstemons, as might be expected in such a cool season, are very fine.

Ground Work.—Where the planting of beds with herbaceous perennials is contemplated and the ground is cleared, it will be advisable to double dig it after applying a good dressing of manure under each spit. Ground dug now will have time to settle before the planting is undertaken. Land for Carnation-beds and plots

should now be dug, a small quantity of manure or bone-meal being dug in; the former one spit deep, and the latter stirred into the newly turned up soil. Lime too should be applied if the soil is deficient in this constituent, and charred earth is another useful ingredient effective for securing healthy growth in the plants.

Work in General.—Continue the propagation of bedding-plants. Pot up zonal Pelargoniums struck in the open ground; examine tuberous-rooted Begonias, and mark those that have not made good growth. Bought-in tubers are diverse in habit, and those which show defects should not be kept. Take a general survey of flower-garden arrangements, and note all prospective alterations while these are fresh in the memory.

FRUITS UNDER GLASS.

By T. H. C.

Tomatos.—Apply to plants cropping heavily liquid-manure, or Le Fruitier artificial manure, sprinkled on the soil. If trained as cordons, remove side shoots before these attain to a large size, and shorten the foliage a little at a time when crowded. Top-dress plants in pots with a rich loamy compost whenever they show signs of exhaustion, supplementing this by regular supplies of plant-food. Let the atmosphere be buoyant, ventilating freely whenever the weather is favourable. A night temperature of 60°, and by day of 70° to 80°, with ventilation, is adequate where artificial heat is necessary to maintain the plants in a fruiting state. Plants raised in early summer, and now commencing to yield fruit, will, if grown on under cool conditions, be useful for early winter fruiting. Keep the plants growing strongly by affording them fertilisers, as advised for earlier-fruiting plants.

Melons.—The cold, sunless weather towards the end of last month hindered the growth of the latest-planted Melons, and much artificial heat has been necessary. The growth in consequence has been rather weak, and more susceptible to the attacks of insects. If aphides are troublesome, vaporise with XL-All compound, and for red-spider forcible syringings of tepid water or sponging the affected leaves may be resorted to. Apply tepid water only in small quantity till the roots have taken full possession of the beds. Syringe the plants in bright weather at closing time, allowing the temperature to rise with sun-heat to 90° or 95°. By artificial means a day temperature of 75° to 85°, and by night 70° may be afforded. Ventilate upon every favourable opportunity, and in bright weather frequently damp the paths, &c. Early July-raised plants are now swelling their fruits rapidly and will be much benefited by applications of liquid manure or sprinklings of Le Fruitier on the beds, immediately afterwards applying water. At this stage the ripening fruit sometimes splits at this season, therefore be cautious in applying water. Afford ripening fruit a night temperature of 70°, and by day 80° to 85°, with free ventilation and a dry atmosphere, with just enough moisture at the root to maintain the foliage in a fresh condition.

THE KITCHEN GARDEN.

By JOHN FLEMING, Gardener to Sir C. PIGOTT, Bart., Wexham Park, Slough.

Spring and Early Summer Cabbages.—Preparations for this crop should be made as soon as possible, it being advisable to set out the plants in a small state in preference to allowing them to stand in a crowded seed-bed. Any open yet sheltered piece of land in the garden will suit this crop, provided it is well manured, deeply dug, and then made quite firm by trampling it. At Wexham Park the soil is light, and I have planted the Onion quarter and Strawberry beds with Cabbages without previous digging, only hoeing the land deeply, and drawing drills in which to set out the plants. Grown thus, Cabbages make a great number of fibrous roots, and are better enabled to withstand the severities of winter than those planted in loose soil, and it is an easy matter to apply fertilisers when needed. Plant-out the smaller-growing varieties at 18 to 24 inches between the rows, and those of larger growth at 24 to 30 inches, and at a distance of 9 to 12 inches respectively from plant to plant, so that each

alternate plant in a row may be pulled up for use early in the spring. The plants should be made quite firm in the soil, and be afforded water, a small ring of finely-sifted coal-ashes being placed round each.

Spinach.—Make a large sowing on well-manured, deeply-dug ground, making it moderately firm before sowing the seeds, and applying a copious dressing of wood-ashes or charred, finely-sifted garden-refuse. Generally speaking, Spinach sown at this date may be relied upon to withstand the winter frosts; still it will be prudent to make another sowing. Continue to thin out earlier sowings, and to sprinkle the plants occasionally with fresh soot and wood-ashes, and to aerate the soil and destroy weeds by the use of the hoe.

Winter Onions.—Those that were sown last month being well advanced in growth should receive a good dressing of soot and wood-ashes, and when the soil is dry the land should be hoed occasionally. If not already done, let the harvesting of the spring-sown crop be finished forthwith, and store the bulbs when they are thoroughly dried.

Leeks.—Take advantage of fine weather to mould-up the plants; and, unless growing on very light land, do not afford them water at the root after this date.

Carrots.—Lift the early-sown Carrots, or many of them will split and become almost worthless; and store them in sand or coal-ashes in a cellar or other cool place. Thin out later sowings as soon as the plants have made a few true leaves, and ply the Dutch-hoe between the rows of plants.

Radishes.—Make a sowing of the French Breakfast Radish on a south border, where protection can be afforded when needed, or in cold frames, but not using the lights till frosty weather sets in. Protect the seeds from birds. Sow Mustard and Cress weekly in similar positions, covering the seeds with mats till germination has taken place. Lettuce and Endive may be tied up to blanch when the leaves are dry. Thin out late sowings, planting the thinnings at the foot of a south wall or near to the lights in cold frames.

THE APIARY.

By EXPERT.

THE bees are still doing well and storing surplus, although I fear the honey flow has been very poor in a good many districts. Unfinished sections should still be closed to allow them to be properly filled if possible, care being taken to cover up carefully the empty space to prevent them building combs, and also to confine them to the sections. When the body-box is filled with honey and the bees strong, a few sections can be placed on, as these may keep the bees quiet. The entrances to all hives should be closed up a little to enable each stock to protect itself better in case of robbing. As soon as bees are noticed destroying the drones, it may be presumed the honey flow is over, and the entrances should be closed. Take away all honey as soon as it is removed from the hives, and all small pieces of comb with honey on it; and dividers with any honey however small on them should be covered or taken away. A mixture of carbolic acid should always be handy, one part of acid to five or six parts of water, for spraying the entrance as soon as robbing is noticed, or a tin of carbolic powder will answer the same purpose. Sections that are partly filled, and that the bees are not likely to complete, should be extracted and placed on the hives for the bees to clear out, and when dry they may be taken off. The same applies to shallow frames. The grass should be kept short round the hives, particularly in the front, and dry quilts given when the old ones have become wet. Stocks which have not done well should be marked out for attention in the near future. Place a little beer and vinegar about the apiary to entice moths and wasps; a long-necked bottle is a good death-trap for them if half filled. Wax-moth should be noted and every one destroyed, and when hives have got very bad they should be transferred to another hive, and each frame well cleansed.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the Publisher. Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPT. 15. { Royal Horticultural Society's
Committee Meets. Lecture
on "Edible Fungi."
National Dahlia Society's Floral
Committee Meeting at Drill
Hall.

FRIDAY, SEPT. 18. { Horticultural Show at Gothen-
burg, Sweden (five days).

SALES FOR THE WEEK.

MONDAY to FRIDAY NEXT—
Dutch Bulbs, at 67 and 68, Cheapside, E.C., by
Protheroe & Morris, at 10.30.

MONDAY NEXT, SEPT. 14—
Trade Sale of Pot Plants at Dyson's Lane Nurseries,
Upper Edmonton, by Protheroe & Morris, at 11.

TUESDAY NEXT, SEPT. 15—
Trade Sale of Winter Blooming Heaths at Burnt
Ash Road Nurseries, Lee, by Protheroe & Morris,
at 11.

WEDNESDAY, SEPT. 16—
Trade Sale of Winter Flowering Plants, at the
Nurseries, South Woodford, by Protheroe & Morris,
at 11.—L. Harris, Palm Seeds, &c., at 67 and 68
Cheapside, E.C., by Protheroe & Morris, at 4.

THURSDAY, SEPT. 17—
Sale of Stove and Greenhouse Plants, &c., at the
Blimsdown Nurseries, Green Street, Enfield High-
way, by Protheroe & Morris at 11.—Trade Sale of
Winter Blooming Heaths, at Longlands Nurseries,
Sidcup, by Protheroe and Morris, at 11.

FRIDAY, SEPT. 18—
Clearance Sale of Nursery Stock at Green's Nur-
sery, Staines Road, Hounslow, by Protheroe and
Morris, at 12.—Orchids at 67 and 68 Cheapside, E.C.,
by Protheroe and Morris, at 12.30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced
from observations of Forty-three Years at Chiswick
—58.7°.

ACTUAL TEMPERATURES:—

LONDON.—Sept. 9 (6 P.M.): Max. 67°; Min. 50°.

Sept. 10.—Overcast, noon; 62°.

PROVINCES.—Sept. 9 (6 P.M.): Max. 61°, Hastings;
Min. 46°, Aberdeen.

Old Age in
Plants. We take from a recent number
of the *Bulletins d'Arboriculture*
the following remarks by M.

JULES BURVENICH on old age in plants:—

A paper published at Prague, and entitled
Bohemia, contains the following remarks
concerning certain analogies between animal
and vegetable organisms:—

"Certain plants increase by offsets; this
method of propagation is also found in cer-
tain animals of low organisation, portions of
which, when completely detached, become
perfect individuals.

"In Germany an important fact has lately
been discovered. All the Lombardy Poplars
in the country are descendants from a single
male specimen imported from the East,
which is still in existence in the Wörlitz
Park. Offsets from this tree were distri-
buted, so that all the Lombardy Poplars in
Italy and Germany are, as it were, like one
huge individual specimen divided into
several thousand portions. It is said that
all the Italian Poplars are becoming un-
healthy, and gradually dying.

"Dr. OCHSENIUS conjectures, probably
correctly, that the cause of this phenomenon
is that all these Poplars, forming, as was
before said, a single organism, are conse-
quently now all old, and showing every
indication of approaching death.

"Professor WIRT remarks a similar phe-
nomenon in the decadence of the well-
known Rose La France. It has, he says,
been noticed in Germany for several

years that this Rose has become stunted
in growth, and its price enhanced. In
the environs of Frankfort rosarians are
suffering considerable loss, as, in spite of
their utmost care, plants of this variety of
Rose are perishing, while other sorts are
doing wonderfully well. Some growers have
even tried, and with success, to replace this
variety when grown wholesale with another
that closely resembles it.

"It would be useless to seek the cause of
this general failure in the composition of
the soil or the presence of vegetable or
animal parasites; it seems more correct to
regard this condition, not as disease properly
so called, but as due to the 'weakness of
age,' it having been sent out in 1867.

"These facts are not surprising, remarks
M. JULES BURVENICH, as they are frequently
demonstrated in the cultivation of other
plants, raised, not from seed, but from buds,
layers, grafts, or suckers. It is owing to
this degeneration in plants propagated thus
artificially that sooner or later it becomes
essential to have recourse to seed in order
to obtain new stock or to recover varieties
already obtained from their 'weakness of
age.' This condition of things is evident,
for instance, in the case of the Potato, in
that of Strawberries, and of fruit-trees in
general."

We do not know how far our readers will
agree with these statements. We can
understand the death of old cells worn out
from various causes; but all the time the
protoplasm is healthy and the cells retain
the power of multiplying their number,
there is no reason, other things being equal,
why the life of the plant should not be
prolonged indefinitely.

ROYAL HORTICULTURAL SOCIETY.—EXHIBI-
TION OF EDIBLE FUNGI.—On Tuesday, Sept. 15,
an Educational Exhibition of Edible Fungi will
be held in the Drill Hall, Buckingham Gate,
Westminster, 1—5 P.M.; and an illustrated
lecture upon them will be given by Dr. M. C.
COOKE, M.A., V.M.H., at 3 o'clock. All in-
terested in extending or acquiring knowledge
of the edible species are invited to send collec-
tions. Collections should, if sent, be delivered at
the Drill Hall on Monday afternoon, Sept. 14; or,
if brought, they should arrive at or before 9 A.M.
on the Tuesday, so that they may be properly
grouped and arranged by the Fungus specialists.
Intimation of an intention to exhibit should, if
possible, be sent a few days before to the Secre-
tary, Royal Horticultural Society Office, 117, Vic-
toria Street, Westminster, S.W.

— FRUIT AND VEGETABLE SHOW AT CHIS-
WICK, SEPTEMBER 29, 30, AND OCTOBER 1.—
Alteration in Schedule.—The prizes offered in
Class 52 for Apple "Charles Ross" will be open
to nurserymen and market-growers, as well as to
gardeners and amateurs (see Division V., p. 24).
Intending exhibitors at this show can obtain a
copy of the schedule, with the official entry form,
on application to the Secretary, Royal Horti-
cultural Society, 117, Victoria Street, S.W. Entries
for this show close on Tuesday, September 22.

— At a general meeting of the Royal Horti-
cultural Society held on Tuesday, September 1,
twenty-two new Fellows were elected, making a
total of 1,117 elected since the beginning of the
present year.

NATIONAL ROSE SOCIETY.—We are informed
that a special meeting of the Committee will be
held at the rooms of the Horticultural Club,
Hotel Windsor, Victoria Street, Westminster, on
Tuesday the 15th inst., at 3 P.M. EDWARD

MAWLEY, Hon. Secretary. "AGENDA: For the
purpose of deciding on the date of the Metro-
politan Show in 1904, and also where it shall be
held. The attendance of members is earnestly
requested."

THE GARDENERS' DINNER.—We have been
asked to correct an impression which seems to
prevail amongst foremen and under gardeners,
that they are not eligible to attend the Gardeners'
Dinner on September 29. That is not the case.
All engaged in horticulture will be (with tickets)
cordially welcomed. The Committee wish it to
be known that any purchaser of tickets wishing to
have parties of friends seated together, should
send his name and the number of the party
several days prior to the dinner, when the Dinner
Committee will do their best then to arrange seats
as desired. It should also be made known that
no tickets can be issued later than September 25,
by which date also all payments must have been
made to the Secretary, Mr. A. Dean, Kingston-
on-Thames.

THE NATIONAL DAHLIA SOCIETY.—We are
informed by the Secretary, Mr. P. W. TULLOCH,
that, by permission of the Royal Horticultural
Society, an inspection by the Committee of the
National Dahlia Society of the Cactus Dahlias
grown for trial at Chiswick will be held at
Chiswick Gardens on September 17, at 2 P.M. A
prize of 10s. 6d., the gift of Mr. A. DEAN, will be
awarded to the raiser of the best variety for
garden decoration.

GLADIOLUS FROM RAMSGATE.—Mr. W. C.
Bull, of Ramsgate, who raised the white variety
Nymph, illustrated in our last issue, writes—
"I am sending a few spikes of my seedling
Gladioli. I have been working on these for many
years, especially on the white and yellow shades,
with a view of getting a strain possessing, 1st, vigor-
ous constitution and habit; 2nd, purity of colour,
both in self and bizarre varieties; 3rd, a type of
flower of compact strong shape, which will stand
rough weather and come true to colour and form
without any shading or codling. The introduc-
tion of the characteristics of Gladiolus Saundersi,
will, I am sure, lead to great results, but several
of its bad points, such as the weak peduncle,
loosely built floppy flowers, and irregular
order of their opening in the spike, will have
to be eliminated. I find also an increasing
tendency for the normally mono-symmetrical
flowers to become regular with actinomorphic
symmetry, the flowers pointing upwards—a
weak characteristic, as they weather badly,
filling up with rain. I have, in fact, some
seedlings which resemble more in their individual
pips a Lapageria than a Gladiolus. They are
very lovely all the same when cut and arranged
in a vase placed on a low table so that the flowers
are looked down upon. I have in view also a
strain of very dwarf and compact Gladioli of the
Gandavensis type, especially good for cutting for
filling the ordinary-sized table or mantelpiece
vase, about 20 inches to 2 feet high, of bright and
pure colours, free from the harsh contrasts of
colour and hooded form of flower found in many
of the dwarf Lemoinei section. I think there is
room for such a strain, and hope in a season or
two to have a fairly numerous collection of these
little 'Lilliputs.'" Our correspondent sends a
very interesting lot of flowers, and we shall
look forward with pleasure to witness future
developments.

FLOWERS IN SEASON.—We have received
from Messrs. W. WATSON & SONS, nurserymen,
Clontarf, Dublin, some flowers of a pretty fancy
self Carnation, Mrs. Lora Armstrong, for which
they have received the Certificate of the Royal
Horticultural Society of Ireland, on their show-
ing the variety on August 25, and an Award of
Merit at Glasgow on the 2nd inst. It was raised
by Mr. DOWLING, gr. to Mrs. L. ARMSTRONG, of

Hollywood, Carrickmines, from whose employer Messrs. WATSON have purchased the entire stock of this variety. The colour is salmon-pink, and the flower has stout, erect stems, and does not burst its calyx.

THE FRUIT FAMINE IN PERSHORE AND EVESHAM.—In several of the villages surrounding Pershore and Evesham, the inhabitants, says a contemporary, are on the verge of bankruptcy owing to the failure of the fruit crop. Thousands of acres of land are wholly devoted to the cultivation of the Pershore Yellow Plum, which at this time of the year is in great demand for jam-making. The oldest residents do not remember a more disastrous season. One fruit-grower states that in an average season he sells from 15,000 to 18,000 pots of Plums, a pot containing 72 lb. This year, although he has been far more fortunate than his neighbours, owing to several of his orchards being in sheltered positions, he estimates he will only gather one-tenth of that quantity. The manager of a jam factory reports that he will not gather a single pot from his orchard, while an Evesham firm, who are growers and salesmen, expect to gather only from four to five pots from an orchard which last year yielded over 1,500 pots. The small growers, and each village contains twenty to thirty at least, had a very indifferent season last year, and they began this year in debt, but hoped to tide over their difficulties with the September sales. Ninety-nine per cent. of them, however, have not gathered a single pot of Plums. The price has gone up by 300 to 400 per cent. In 1901 Plums were so plentiful that a pot could be purchased for 1s., and last year at from 5s. to 8s., while only this week purchasers willingly paid 15s. to 16s. per pot for good fruit.

"BOTANICAL MAGAZINE."—The September number is noteworthy, amongst other things, for its wrapper, whereon Mr. W. B. HEMSLEY'S name appears as assisting Sir JOSEPH HOOKER. Mr. HEMSLEY'S long association with Kew, his practical knowledge of garden plants, his vast knowledge and experience, render him eminently fitted to assist the revered Editor. The plants figured in the present number are:—

Senecio tanguticus, of Maximowicz, tab. 7,912.—A Chinese species of large dimensions (6 to 7 feet), deeply-cut leaves, and many-flowered pyramidal panicles. The flower-heads contain only a few yellow flowers. The seeds were sent home by Mr. WILSON, and the plants flowered at Coombe Wood, in the nursery of Messrs. JAMES VEITCH & SONS.

Dialea Gilliesii, Hooker & Arnott, tab. 7,913.—A white-flowered Chilean Crucifer, having much the appearance of *Arabis alpina*. Kew.

Iris bucharica, Foster, in *Gardeners' Chronicle*, 1902, i., fig. 135. Kew.

Aloe Cameroni, Hemsley, tab. 7,915.—A handsome caulescent species, with sinuate, toothed leaves, and long spikes of pendent, cylindrical, red flowers tipped with green. A native of eastern tropical Africa, flowered at Kew.

Psychotria capensis, Valke, tab. 7,916.—A South African shrub, with opposite subsessile, obovate-oblong leaves, tapering to the base, and terminal panicles, and cymes of small yellow flowers. Nat. order Rubiaceae. Kew.

"THE ORCHID HUNT."—"In the story that forms the basis of the plot of 'The Orchid Hunt,' now being rehearsed for the opening of the new Gaiety Theatre," says the *Daily Mail*, "an Orchid will lead to complications as varied if not so serious as those that followed the missing letter in 'A Scrap of Paper.' The opening act is laid in Kew Gardens, where a school for the study of the history and cultivation of Orchids is in session. The rivalry of two amateur cultivators of Orchids—a great English statesman and the French Minister for Foreign Affairs—leads to a

wager as to which of them shall secure the most perfect specimen of the plant. Messengers are sent to Peru to search for something of great beauty, and fortune appears to favour England until the wiles of a pretty French girl [enable her to] secure the prize. With this she lands at Nice, where the second act takes place. In the end, however, a humble and amusing English gardener—to be impersonated by Mr. EDMUND PAYNE—produces a still finer specimen that he has quietly grown at Kew."

STOCK-TAKING : AUGUST.—Notwithstanding the drawbacks caused by general unrest on the Continent of Europe, the Trade Returns for the past month are of a satisfactory nature. The imports show an increase of £2,348,885 on the month of August last year, the figures being £42,761,456 against £40,412,571. There were great increases in sugar, raw and refined, accompanied by a rise in Tea and Wheat—got well in front from all quarters excepting the United States. In all articles of food apart from the above there were many variations, and a large falling off has to be recorded in tobacco. The following summary table will be found of interest:—

IMPORTS.	1902.	1903.	Difference.
	£	£	£
Articles of food and drink—duty free	9,981,747	9,398,280	-583,467
Articles of food & drink—dutiable	8,045,460	9,880,051	+1,934,591
All other Imports...	22,385,361	13,383,125	+997,761
